M. Teppone.

Chronology of the Swine Flu Pandemic: Additional Information.

A collection of articles, documents, news, and remarks on history of a Swine Flu Pandemic and a Global Vaccination Project organized in 2009-2010. – RemembeЯ, 2024-2025, P. 1370.

Disclaimers

This Collection was compiled by Dr. Mikhail Teppone.

It was prepared in the course of research on Swine Flu Pandemic which was declared in 2009. The need for this collection is due to the fact that many web pages with the information related to the history of a 'Swine Flu Pandemic' and a 'Global Vaccination Project' have been lost or removed from the original web-sites (see Chapter 11) and were preserved only in the web archive.

Another reason for preparing this collection is that historical facts published not at the scientific sources but at news platforms are usually forgotten and become inaccessible for further research.

The Collection has been prepared for research and education purposes to encourage further studies related to influenza pandemics that have occurred in the XXI century.

The Collection includes information that was found in the public domain.

The Compiler declares there is no conflict of interests or any financial interest.

Contents

Chapters	page
1. Introduction: Some events before Declaration of the Swine Flu Pandemic	1
2. Homeless people die after a bird flu vaccine trial in Poland in July 2008	11
3. Anti-Flu vaccine was Contaminated with the deadly Bird Flu virus	17
4. Change of a Definition of a Pandemic on the WHO website	195
5. A Genetically Engineered Swine Flu virus Could Escape from a Laboratory	391
6. Poland was alone in fighting against a Global Vaccination Project in 2009-2010	497
7. A Pandemic Attack against Ukraine	587
8. Belarus Ignored False Swine Flu Pandemic	797
9. Autism and Encephalopathy; Mercury, Methylmercury, Thimerosal, Squalene, etc.	811
10. Additional information related to a Swine Flu Pandemic	1079
11. Examples of the lost or 'not found' websites	1357
12. Universal Treatment of any Acute Infectious Disease	1367

Jefferson: It's true that influenza viruses are unpredictable, so it does call for a certain degree of caution. But one of the extraordinary features of this influenza – and the whole influenza saga – is that there are some people who make predictions year after year, and *they get worse and worse*.

None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all? Nothing. But that doesn't stop these people from always making their predictions. *Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur*. [A Whole Industry is Waiting for a Pandemic. – Spiegel International, 21 July 2009]

No Cure For That Cold?

By Mary Jo Takach

New York

THE common cold is like the weather — everybody talks about it but no one can do much about it.

Nearly 26 years ago Britain's Medical Research Council set up a unit at Harvard Hospital, Salisbury, to study common colds. In the beginning, in England, as in the United States, the major research was to identify the cause of the common cold. The study of viruses was young and scientists were hopeful that only one or two caused the common cold.

Volunteers Exposed

The original viruses were identified by exposing volunteers to them and seeing what happened. The volunteers would be inoculated with potentially infectious viruses by placing a few drops of liquid containing them into the nose and if any of them developed colds this would indicate that virus had been present in the inoculus, explains Dr. Sylvia Reed of the cold unit's research staff.

Today, the number of viruses is no longer of interest. "It is now known that there are more than 90 serotypes of rhinoviruses, which do not cross-immunize against one another," Dr. Reed says. "Furthermore, a new group of viruses has also been isolated. These are called human coronaviruses and they also cause typical colds."

Dr. James Spray of the National Center for Disease Control in Atlanta, Ga., estimates that there are at least 200 cold viruses which cause Americans to lose 47 million workdays and 65 million school days every year.

These viruses do not cross-immunize. This means each virus would need its own vaccine. In addition, vaccines cause antibodies in the bloodstream and cold viruses affect the outer linings of the nasal passages — just about as far away from the bloodstream as one can get in the body," Dr. Spray notes. Also, the immunity against a cold lasts for about two weeks.

Thus, researchers have decided it is just not worth the effort to develop 200 vaccines which would have to be given every two weeks or so. The U.S. National Institutes of Health (NIH) closed down its Board of Vaccine Development last year, deciding it was a waste of time and money. The British equivalent is still flourishing although the trend of its research has changed radically.

There are at least 200 cold viruses

Volunteers, however, still enroll in the British program for 10 days. Only healthy people aged 18 to 50 are accepted and they are isolated in pairs or threes in comfortable apartments. The only people the volunteers meet other than their "flatmates" are the doctor, nurse and virologists, who are all gowned and masked.

Many of the volunteers are students, nurses, married couples or groups of housewives who can enjoy a relaxing holiday without expenses and with a bit of pocket money. Only about a third come down with a cold. Some actually return for another "vacation."

"At present," Dr. Reed explains, "the volunteers assist in two main research topics." One is assessing the activity in man of antiviral drugs. The other is testing influenza vaccines.

"At Salisbury, drugs which are known to be active against respiratory viruses in test tubes and which have satisfactorily completed their toxicology testing can be assessed for activity against experimental infections of volunteers using rhinoviruses, coronaviruses or attenuated influenza viruses," Dr. Reed says.

Possible Drugs

There are several drugs, according to Dr. Donald D'Alessio, an assistant professor of preventive medicine at the University of Wisconsin, which show some tendency to kill viruses the way antibiotics kill bacteria. "We have tested several compounds which showed activity in tissue against a group of viruses. Unfortunately, in humans the activity of these drugs is marginal."

When a specific compound does not work, researchers then try different derivatives of the compound in hope that one of these will prove stronger. As of yet, Dr. D'Alessio says, there has been no compound that shows itself to be "hot stuff," despite recent reports of one that has given some positive results in animal tests.

THE State Journal

W. Kim Heron

Tomorrow's Sci-Fi: Aspiring writers gather here at feet of pros

The State Journal (Lansing, MI), 1975, Aug 12, Tue, p. B-3.

Stan Robinson from California stood in the phone booth: "I found your letter on the floor. I guess it has been there about two weeks so I figured I better call ... Yes, things are going well, Damon is here ..." The revered editor and writer Damon Knight of science fiction circles and his wife Kate (Kate Wilhelm of science fiction and nonscience fiction circles) were in their room with four of the floating pool of 25 Clarionoids writers of the Clarion science fiction writing workshop con-ference and their coordinator Larry Isaacs.

Tomorrow's Sci-Fi

Aspiring Writers Gather Here at Feet of Pros

Damon Knight Kate Wihelm

The Mason Hall apartment on Michigan State University campus. on one of the final mornines of the work-shop, was littered with peanut jars, beer bottles. empty glasses. glasses being emptied, manuscripts. Damon's bare feet over the edge of the coffee table and bing-flopping-bing-thud, mini-sized superbails careening off the walls, making occupants duck. Welcome to closing scenes from Clarion 8: A science fic-tion writer's workshop which for the past six weeks put together 25 aspiring science fiction writers with six professionals, one a week for the first four weeks. then the Knights for two weeks together.

The first four were Samuel Delaney, Gene Wolfe, Joe Haldeman and Roger Zelanzny, all familiar names to science fiction devotees. Damon Knight also buys workshop material for his biannual "Orbit" hard-back anthology. This year Kate Wilhelm is planning an anthol ogy of Clarion writers, to indude this year's workshop and last year's. The original "Clarion" series was edited by former director Robin Scott Wilson. After watching one clannoid spit a ping pong ball out of his mouth – which struck another, cutting off his Donald Duck imitation during an early morning insanity session – Isaacs explained that "this year may not be the best writers, or the brightest intellects, but they do display the widest array of talents." The writers come from a variety of backgrounds though most are either college students, graduates or dropouts. They vary in age from 18 to 37 and geologically they range coast to coast and north to Saskatoon in Canada.

Most Have written before; some have been published, others have collected folders full of rejection notices. All are white. 21 are male and four female. The attraction to science fiction is in part no different from the attraction of Buck Rogers in the pulp '40s: The fantastic. Len Rosenberg, an unem ployed former college student from New York, said, "I like the fantastic and the weird, and I think that science fiction is a good kind of meta-phor for society and the changes that are taking place."

Knight Puts it in a larger context, saying that our current notions of fiction come from realism and naturalism, a movement that is only about 100 years old. "All the way back men have dreamed of strange places. like Sinbad's voyages to strange places," said Kate Wilhelm. "Now it's spaceships instead of sailing boats." The workshop produced numerous stories around three problems in particular raised by current science: Cloning, genetic manipulation and brain control.

Cloning is a technique where a single cell or bit of tissue from an organism could be used to regrow an entire organism. In human terms, scientists could thus grow a twin from anyone, using a piece of his or her tissue.

Genetic manipulation is the process of altering the genes which determine the form, function and operation of an organism. For example, a genetically altered human could have gills, while a genetically altered virus might be one human beings, would have no immunity to. Recent brain research has revealed new information about how the brain operates. but this knowledge can be used for good or evil.

All these become fertile grounds for science fiction writers worried about the re-luctance of scientists to look into the implications of their own research. While science, technology and gadgetry have been corn-mon in science fiction, the writers today enter a more literate and more respectable field than the pulp days. Science fiction has become an accepted part of many college programs and is being adopted m high schools. What was a "ghettoized" school of writing is now closer to the mainstream than ever. But the short story market the writers hope to sell to is in a dreary state. Reprints outsell new material and pay averages three cents a word. A major impact of the workshop, according to most participants and writers alike was on basic writing skills, not problems particular to science fiction.

But what the workshop offered most of all was in-stant feedback. Mike Berlyn, a college stu-dent from Florida, busily edit-ing another writer's manus-cript, said, "The great thing is that you're with each other 24 hours a day. "You get direct feedback," he said. "This workshop has taken my writing from the 1940s to the 1970s ... well, at least the 1950s."

APRIL 25TH 1992

Changing your genes

"BIOLOGY is destiny." Though the years have been unkind to Sigmund Freud's thought, that notion sounds fresher now than when he said it. In the 1950s the threads of destiny were given form when Crick and Watson elucidated the double-helix structure of DNA. In the 1960s the language of genes, in which the messages stored on DNA are written, was translated; biology, and much else, began to change. Genes are blamed for everything from cancer to alcoholism. People worry about being made ineligible for jobs because of disease susceptibilities they never knew they had; fetuses are aborted because of faults in their genes; criminals are defined by the bar-codes of their genetic fingerprints.

At first glance, genetic therapy—the nascent art of giving sick people new genes to alleviate their illness—looks like the apotheosis of this trend towards reducing human life to a few short sequences of DNA. But although its advent means people will be talking in the language of genes even more than they already do, the way they talk will change. They will not be passively reading out the immutable genetic lore passed down from generation to generation. They will not be receiving orders; they will be giving them. The birth of genetic therapy marks the beginning of an age in which man has the power to take control of his genes and make of them what he will.

New promises, new threats, old answers

At the moment, gene therapy is a small field on the fringes of medicine and biotechnology. Genes carry descriptions of proteins, the molecules that do most of the body's work; if someone is missing a gene, they will be missing a protein, and may thus suffer a deficiency or disease. If a gene or set of genes runs amok, cancer can result. The gene-therapists aim to provide the body with genes to make good its deficiencies and problems. If their field had grown as fast as the stacks of ethical reports and regulatory procedures that surround it, it would already be big business. As it is, after years of discussion, it is only now starting to blossom. Therapies are being tried on people around the world (though in tiny numbers) and new ways of delivering genes are being devised (see pages 95-97). A torrent of raw material for tomorrow's therapies is flowing from the human de-

the drug is being made inside the body. There already exist sets of rules for trying out drugs. The question of the drug's provenance is of secondary importance, as long as its manufacture can be shown to be safe. Experimental gene therapy has satisfied regulators on that count, so far.

"So far", though, is only the beginning. Beyond today's gene therapy, which is a specialised form of medicine not that dissimilar to others, lie far more controversial possibilities: changing genes for non-medical reasons, and changing genes wholesale in such a way that the new genes are passed on from generation to generation. At present, therapists aim at genes that are clearly villains, and the therapies last at most as long as the patient, and often only as long as a transient set of cells. But what of genes that might make a good body better, rather than make a bad one good? Should people be able to retrofit themselves with extra neurotransmitters, to enhance various mental powers? Or to change the colour of their skin? Or to help them run faster, or lift heavier weights?

Yes, they should. Within some limits, people have a right to make what they want of their lives. The limits should disallow alterations clearly likely to cause harm to others. Even if the technology allowed it, people should not be allowed to become psychopaths at will, or to alter their metabolism so that they are permanently enraged. Deciding which alterations sit in this forbidden category would have to be done case by case, and in some cases the toss may be passionately argued. But so it is with all constraints on freedom. Minimal constraint is as good a principle in genetic law as in any other.

People may make unwise choices. Though that could cause them grief, it will be remediable. That which can be done, can be undone; people need no more be slaves to genes they have chosen than to genes they were born with. To keep that element of choice, however, one thing must be out of bounds. No one should have his genes changed without his informed consent; to force genetic change on another without his consent is a violation of his person, a crime as severe as rape or grievous bodily harm. There may be subtle social pressures to choose certain traits; but there is often social pressure for all sorts of things, and it does not deny the subject free will

One World, One Health:
Building Interdisciplinary Bridges to Health in a Globalized World

New York, The Rockefeller University, 29 September 2004
http://www.oneworldonehealth.org/sept2004/owoh_sept04.html

Conference Summary

Health experts from around the world met on September 29, 2004 for a symposium focused on the current and potential movements of diseases among human, domestic animal, and wildlife populations organized by the Wildlife Conservation Society and hosted by The Rockefeller University. Using case studies on Ebola, Avian Influenza, and Chronic Wasting Disease as examples, the assembled expert panelists delineated priorities for an international, interdisciplinary approach for combating threats to the health of life on Earth. The product—called the "Manhattan Principles" by the organizers of the "One World, One Health" event, lists 12 recommendations (see below) for establishing a more holistic approach to preventing epidemic / epizootic disease and for maintaining ecosystem integrity for the benefit of humans, their domesticated animals, and the foundational biodiversity that supports us all.

Representatives from the World Health Organization; the UN Food and Agriculture Organization; the Centers for Disease Control and Prevention; the United States Geological Survey National Wildlife Health Center; the United States Department of Agriculture; the Canadian Cooperative Wildlife Health Centre; the Laboratoire Nationale de Sante Publique of Brazzaville, Republic of Congo; the IUCN Commission on Environmental Law; and the Wildlife Conservation Society were among the many participants.

The Manhattan Principles on "One World, One Health"

Recent outbreaks of West Nile Virus, Ebola Hemorrhagic Fever, SARS, Monkeypox, Mad Cow Disease and Avian Influenza remind us that human and animal health are intimately connected. A broader understanding of health and disease demands a unity of approach achievable only through a consilience of human, domestic animal and wildlife health - One Health. Phenomena such as species loss, habitat degradation, pollution, invasive alien species, and global climate change are fundamentally altering life on our planet from terrestrial wilderness and ocean depths to the most densely populated cities. The rise of emerging and resurging infectious diseases threatens not only humans (and their food supplies and economies), but also the fauna and flora comprising the critically needed biodiversity that supports the living infrastructure of our world. The earnestness and effectiveness of humankind's environmental stewardship and our future health have never been more clearly linked. To win the disease battles of the 21st Century while ensuring the biological integrity of the Earth for future generations requires interdisciplinary and cross-sectoral approaches to disease prevention, surveillance, monitoring, control and mitigation as well as to environmental conservation more broadly.

We urge the world's leaders, civil society, the global health community and institutions of science to:

1. Recognize the essential link between human, domestic animal and wildlife health and the threat disease poses to people, their food supplies and economies, and the biodiversity essential to maintaining the healthy environments and functioning ecosystems we all require.

2. Recognize that decisions regarding land and water use have real implications for health. Alterations in the resilience of ecosystems and shifts in patterns of disease emergence and spread manifest themselves when we fail to recognize this relationship.

3. Include wildlife health science as an essential component of global disease prevention, surveillance, monitoring, control and mitigation.

4. Recognize that human health programs can greatly contribute to conservation efforts.

5. Devise adaptive, holistic and forward-looking approaches to the prevention, surveillance, monitoring, control and mitigation of emerging and resurging diseases that take the complex interconnections among species into full account.

6. Seek opportunities to fully integrate biodiversity conservation perspectives and human needs (including those related to domestic animal health) when developing solutions to infectious disease threats.

7. Reduce the demand for and better regulate the international live wildlife and bushmeat trade not only to protect wildlife populations but to lessen the risks of disease movement, cross-species transmission, and the development of novel pathogen-host relationships. The costs of this worldwide trade in terms of impacts on public health, agriculture and conservation are enormous, and the global community must address this trade as the real threat it is to global socioeconomic security.

8. Restrict the mass culling of free-ranging wildlife species for disease control to situations where there is a multidisciplinary, international scientific consensus that a wildlife population poses an urgent, significant threat to human health, food security, or wildlife health more broadly.

9. Increase investment in the global human and animal health infrastructure commensurate with the serious nature of emerging and resurging disease threats to people, domestic animals and wildlife. Enhanced capacity for global human and animal health surveillance and for clear, timely information-sharing (that takes language barriers into account) can only help improve coordination of responses among governmental and non-governmental agencies, public and animal health institutions, vaccine / pharmaceutical manufacturers, and other stakeholders.

10. Form collaborative relationships among governments, local people, and the private and public (i.e.-non-profit) sectors to meet the challenges of global health and biodiversity conservation.

11. Provide adequate resources and support for global wildlife health surveillance networks that exchange disease information with the public health and agricultural animal health communities as part of early warning systems for the emergence and resurgence of disease threats.

12. Invest in educating and raising awareness among the world's people and in influencing the policy process to increase recognition that we must better understand the relationships between health and ecosystem integrity to succeed in improving prospects for a healthier planet.

It is clear that no one discipline or sector of society has enough knowledge and resources to prevent the emergence or resurgence of diseases in today's globalized world. No one nation can reverse the patterns of habitat loss and extinction that can and do undermine the health of people and animals. Only by breaking down the barriers among agencies, individuals, specialties and sectors can we unleash the innovation and expertise needed to meet the many serious challenges to the health of people, domestic animals, and wildlife and to the integrity of ecosystems. Solving today's threats and tomorrow's problems cannot be accomplished with yesterday's approaches. We are in an era of "One World, One Health" and we must devise adaptive, forward-looking and multidisciplinary solutions to the challenges that undoubtedly lie ahead.

Baxter H5N1 Pandemic Influenza Vaccine Clinical Study Team

A clinical trial of a whole-virus H5N1 vaccine derived from cell culture

N Engl J Med. 2008, Jun 12; 358 (24): 2573-2584
doi: 10.1056/NEJMoa073121. PMID: 18550874.

Abstract

Background: Widespread infections of avian species with avian influenza H5N1 virus and its limited spread to humans suggest that the virus has the potential to cause a human influenza pandemic. An urgent need exists for an H5N1 vaccine that is effective against divergent strains of H5N1 virus.

Methods: In a randomized, dose-escalation, phase 1 and 2 study involving six subgroups, we investigated the safety of an H5N1 whole-virus vaccine produced on Vero cell cultures and determined its ability to induce antibodies capable of neutralizing various H5N1 strains. In two visits 21 days apart, 275 volunteers between the ages of 18 and 45 years received two doses of vaccine that each contained 3.75 microg, 7.5 microg, 15 microg, or 30 microg of hemagglutinin antigen with alum adjuvant or 7.5 microg or 15 microg of hemagglutinin antigen without adjuvant. Serologic analysis was performed at baseline and on days 21 and 42.

Results: The vaccine induced a neutralizing immune response not only against the clade 1 (A/Vietnam/1203/2004) virus strain but also against the clade 2 and 3 strains. The use of adjuvants did not improve the antibody response. Maximum responses to the vaccine strain were obtained with formulations containing 7.5 microg and 15 microg of hemagglutinin antigen without adjuvant. Mild pain at the injection site (in 9 to 27% of subjects) and headache (in 6 to 31% of subjects) were the most common adverse events identified for all vaccine formulations.

Conclusions: A two-dose vaccine regimen of either 7.5 microg or 15 microg of hemagglutinin antigen without adjuvant induced neutralizing antibodies against diverse H5N1 virus strains in a high percentage of subjects, suggesting that this may be a useful H5N1 vaccine. (ClinicalTrials.gov number, NCT00349141.)

An effective avian flu vaccine was already developed and tested before the middle of 2008

dziennik.pl

Szczepionkę na ptasią grypę testowali na bezdomnych

Dziennik.pl, 2 lipca 2008, 03:09 (2 July 2008)
https://wiadomosci.dziennik.pl/wydarzenia/artykuly/126671,szczepionke-na-ptasia-grype-testowali-na-bezdomnych.html

Za każde zaszczepienie nowym specyfikiem przeciwko grypie bezdomni z Grudziądza dostawali od przychodni po 5-10 złotych. Nie wiedzieli jednak, że nie chodziło o zwykłą grypę, a o siejącą na świecie spustoszenie ptasią grypę. Kilkanaście osób zmarło. Czy ich śmierć miała związek z testami? Do szokujących informacji dotarł reporter "Faktów" TVN. Zachowanie lekarzy potępiła minister zdrowia Ewa Kopacz.

Bezdomni twierdzą, że nie wiedzieli, iż szczepią ich przeciwko ptasiej grypie. W kwietniu 2007 roku grudziądzka przychodnia "Dobra Praktyka" wysłała do nich zapytanie, w którym była mowa o nieodpłatnym przekazaniu szczepionki przeciw zwykłej grypie o nazwie VAXIGRIP. Za każdą szczepionkę mieli dostać pieniądze, dlatego niektórzy zaszczepili się nawet kilkanaście razy. Dopiero teraz okazało się, że otrzymali dwie dawki szczepionki FLUAD- H5N1, która była ocenianą w tym badaniu szczepionką przeciwko groźnemu wirusowi grypy H5N1.

Tuż po szczepieniach kilkanaście osób zmarło. Nie wiadomo, czy testowanie szczepionki było przyczyną śmierci bezdomnych. Wielu z nich to osoby schorowane i wycieńczone trybem życia, dla których takie eksperymenty mogą być niebezpieczne. Statystyka daje jednak wiele do myślenia.

"W 2004 roku zmarło czterech bezdomnych z naszego ośrodka" - przyznaje w rozmowie z "Faktami" Mieczysław Wacławski, kierownik schroniska im św. Brata Alberta w Grudziądzu. Jednak w 2005 i 2006 roku zmarło łącznie 16 osób, w 2007 roku - roku, w którym testowano szczepionkę - aż 21. Według TVN24, pokrzywdzonych może być nawet 350 osób. Około 150 z nich - to bezdomni. Reszta to zwyczajni mieszkańcy, zwabieni zarobkiem.

Kierownictwo przychodni broni się, że wszyscy pacjenci podpisali zgodę na szczepienie i wiedzieli, przeciwko czemu się szczepią.

Wczoraj do toruńskiego sądu wpłynął akt oskarżenia przeciwko trojgu lekarzom i sześciu pielęgniarkom. Jak wykazało śledztwo, oszukali oni nie tylko pacjentów, ale i firmę farmaceutyczną, która zleciła szczepienia. Prokuratura zarzuca im fałszowanie dokumentacji, nakłanianie świadków do składania fałszywych zeznań i poświadczanie nieprawdy, a także przywłaszczenia mienia. Zarzut narażenia zdrowia i życia bezdomnych jednak w akcie oskarżenia nie pada.

Zachowaniem lekarzy oburzona jest minister zdrowia. "Lekarze, którzy prowadzili te badania, nie powinni wracać do zawodu" – tak oskarżonych lekarzy oceniła w programie "Fakty po Faktach" Ewa Kopacz. "W interesie wszystkich lekarzy leży, by ci, którzy zawinili, ponieśli karę" - dodała.

Homeless people die after bird flu vaccine trial in Poland

Three Polish doctors and six nurses are facing criminal prosecution after a number of homeless people died following medical trials for a vaccine to the H5N1 bird-flu virus.

The Telegraph, UK, 2 July 2008, 4:37 pm
https://www.telegraph.co.uk/news/worldnews/europe/poland/2235676/Homeless-people-die-after-bird-flu-vaccine-trial-in-Poland.html
https://web.archive.org/web/20080706125740/https://www.telegraph.co.uk/news/worldnews/europe/poland/2235676/Homeless-people-die-after-bird-flu-vaccine-trial-in-Poland.html

The medical staff, from the northern town of Grudziadz, are being investigated over medical trials on as many as 350 homeless and poor people last year, which prosecutors say involved an untried vaccine to the highly-contagious virus.

Authorities claim that the alleged victims received £1-2 to be tested with what they thought was a conventional flu vaccine but, according to investigators, was actually an anti bird-flu drug.

The director of a Grudziadz homeless centre, Mieczyslaw Waclawski, told a Polish newspaper that last year, 21 people from his centre died, a figure well above the average of about eight.

Although authorities have yet to prove a direct link between the deaths and the activities of the medical staff, Poland's health minister, Ewa Kopacz, has said that the doctors and nurses involved should not return to their profession.

"It is in the interests of all doctors that those who are responsible for this are punished," the minister added.

Investigators are also probing the possibility that the medical staff may have also have deceived the pharmaceutical companies that commissioned the trials.

The suspects said that the all those involved knew that the trial involved an anti-H5N1 drug and willingly participated.

The news of the investigation will come as another blow to the reputation of Poland's beleaguered and poverty-stricken national health service. In 2002, a number of ambulance medics were found guilty of killing their patients for commissions from funeral companies.

MED НОВОСТИ

В Польше несколько бездомных умерли во время испытаний вакцины от птичьего гриппа

MED media, 3 июля 2008, 18:19
https://medportal.ru/mednovosti/v-polshe-neskolko-bezdomnyh-umerli-vo-vremya-ispytaniy-vaktsiny-ot-ptichiego-grippa/

В Польше возбуждено уголовное дело в отношении трех врачей и шести медсестер, предположительно привлекавших постояльцев приюта для бездомных к клиническим испытаниям вакцины против птичьего гриппа. По данным администрации, за время исследования смертность в приюте выросла почти в три раза.

Согласно сообщениям местных СМИ, незаконные испытания экспериментального препарата проводились в приюте польского города Грудзёндз в 2007 году. За каждую прививку испытуемые получали вознаграждение в размере 5-10 злотых, причем некоторые из них прививались по десять и более раз. Как предполагают следователи, испытуемым сообщали, что на них тестируют утвержденный препарат от обычного гриппа, на самом же деле им вводили экспериментальную вакцину для защиты от вируса птичьего гриппа H5N1.

Следователи считают также, что организаторы эксперимента вводили в заблуждение разработчиков препарата, которые ничего не знали о методах подбора и составе участников исследования.

По данным директора приюта Мечислава Вацлавского, в течение 2007 года скончался 21 постоялец этого социального учреждения, тогда как предыдущие годы там фиксировалось в среднем не более 9 смертей в год.

Хотя причинно-следственная связь между всплеском смертности и незаконными испытаниями пока не доказана, министр здравоохранения Польши Эва Копач уже заявила о решимости строжайшим образом покарать виновных.

В свою очередь, подозреваемые в грубых нарушениях медицинской этики медики продолжают настаивать на своей невиновности. По их словам, все привлеченные к испытаниям люди были предупреждены о возможных рисках и подписали информированное согласие на участие в исследовании.

POULTRY WORLD

Natalie Berkhout

Poland: bird flu vaccine scam

Poultry World, 8 April 2009
https://www.poultryworld.net/home/poland-bird-flu-vaccine-scam/

Three doctors and six nurses accused of having tested a vaccine against bird flu on nearly 200 patients without their knowledge went on trial in northern Poland.

The accused health workers have been charged with “fraud, creating false documents and delivering health care without authorisation” to 196 patients, according to judge Piotr Szadkowski of the Torun region.

All nine accused pleaded not guilty, however, if found guilty each health worker could be sentenced to up to 10 years in jail.

It has been reported that the medical personnel are charged with administering a vaccine banned in Poland against the deadly H5N1 strain of bird flu that can be transmitted to humans. Further reports state that the patients were paid for the vaccines.

They allegedly led their patients, many of them poor and homeless, to believe they were being vaccinated against ordinary flu.

REX FEATURES
AVIAN FLU OUTBREAK TIMELINE
1 1996 The highly pathogenic H5N1 virus is isolated from a far med goose in Guangdong Province, China. The first discovery of this new strain originally attracts little attention.
2 May 1997 Eighteen cases of in Hong Kong are infected with avian influenza H5N1 - in the first known case the virus infecting humans. Six people die from the outbreak.
3 Feb 2003 Six years after the first deaths linked to the virus, a subtype remerges. Two human cases, one of which is fatal, are confirmed in a Hong Kong family with a recent travel history to Fujian Province, China.
Dec 2003 South Korea confirms highly contagious
4 ain of bird flu has infected a chicken farm near Seoul. Vietnam, Cambodia, Mongolia, China, Japan, Laos, Malaysia, Thailand, the Philippines, Indonesia and North Korea later confirm similar outbreaks.
Jan 2004 Vietnam identifies H5N1 as the cause of human cases of severe respiratory disease with high
5 ality. Sporadic human cases are reported through mid-March.
July 2005 Russia confirms first outbreak of bird flu and begins cull of 600,000 birds. Simultaneous outbreak
6 bird flu strain deadly to humans confirmed in seven villages in Kazakhstan marks the first cases outside South-East Asia. Indonesia confirms its first human case.
7 Oct 2005 Thai boy diagnosed with H5N1 strain of bird flu two days after his father became the 13th man i n the country to die of the disease. The World Health Organisation (WHO) confirms that death toll in Asia has now reached 61, comprising 41 in Vietnam, 13 in Thailand, 3 in Indonesia and 4 in Cambodia.
Jan 2006 Turkey confirms its first two human cases.
8 oradic cases continue to be reported in the coming weeks, but rapidly end. Iraq confirms i ts first human case, in a 15-year-old girl in Sulaimaniyah
Feb 2006 France first reports H5N1 in a single turkey
9 rm, marking the first appearance of this disease in domestic poultry in the EU.
March 2006 Egypt confirms its first human case in a
10 -year-old woman from Qalubiya.
Jan 2007 Japan sees a resurgence of bird deaths due
11 H5N1. Hungary and Russia also see more cases. In February, Pakistan, Turkey, Afghanistan, and Myanmar joined the list and Kuwait saw its first major outbreak of the virus.
Jan 2007 The first discovery of the virus affecting
12 ish poultry. Only a single outbreak o ccurs.
Jan 2008 Three mute swans are found dead in Dorset with the virulent H5N1 strain of bird flu.
Feb – April 2009 Five people killed by the virus in Vietnam.
13
June 2011 Five cases of H5N1 were confirmed in Egypt – three of which are fatal.
14

Avian Flu Outbreak Timeline

1) 1996: The highly pathogenic H5N1 virus is isolated from a farmed goose in Guangdong Province, China. The first discovery of this new strain originally attracts little attention.

2) May 1997: Eighteen cases of in Hong Kong are infected with avian influenza H5N1 - in the first known case the virus infecting humans. Six people die from the outbreak.

3) Feb 2003: Six years after the first deaths linked to the virus, a subtype remerges. Two human cases, one of which is fatal, are confirmed in a Hong Kong family with a recent travel history to Fujian Province China.

4) Dec 2003: South Korea confirms highly contagious strain of bird flu has infected a chicken farm near Seoul. Vietnam, Cambodia, Mongolia, China, Japan, Laos, Malaysia, Thailand, the Philippines, Indonesia and North Korea later confirm similar outbreaks.

5) Jan 2004: Vietnam identifies H5N1 as the cause of human cases of severe respiratory disease with high mortality. Sporadic human cases are repotted through mid-March.

6) July 2005: Russia confirms first outbreak of bird flu and begins cull of 600.000 birds. Simultaneous outbreak of bird flu strain deadly to humans conformed it seven villages in Kazakhstan marks the first cases outside South East Asia. Indonesia confirms its first human case.

7) Oct 2005: Thai boy diagnosed with H5N1 strain of bird flu two days after his father became the 13th man in the country to die of the disease. The World Health Organization (WHO) confirms that death toll in Asia has now reached 61, comprising 41 in Vietnam,13 in Thailand, 3 in Indonesia and 4 in Cambodia.

8) Jan 2006: Turkey confirms its first two human cases. Sporadic cases continue to be reported in the coming weeks, but rapidly end. Iraq confirms its fist human case in a 15-year-old girl in Sulaimaniyah.

9) Feb 2006: France first reports H5N1 in a single turkey man, marking the first appearance of this disease in domestic poultry in the EU.

10) March 2006: Egypt confirms its first human case in a 16-year-old woman From Qalubiya.

11) Jan 2007: Japan sees a resurgence of bird deaths due H5N1. Hungary and Russia also see more cases. In February, Pakistan, Turkey, Afghanistan, and Myanmar joined the list and Kuwait saw its first major outbreak of the virus.

12) Jan 2007: The first discovery of the virus affecting British poultry. Only a single outbreak occurs. Jan 2008: Three mute swans are found dead in Dorset with the virulent H5N1 strain of bird flu.

13) Feb – April 2009: Five people killed by the virus in Vietnam.

14) June 2011: Five cases of P5T1 were confirmed in Egypt - three of which are fatal.

THE GLOBE AND MAIL

Hellen Branswell

'Flu fatigue' sets in among scientists after global spread of virus slows

The Globe and Mail (The Canadian Press), 1 January 2009
https://www.theglobeandmail.com/news/national/flu-fatigue-sets-in-among-scientists-after-global-spread-of-virus-slows/article1145766/

Five years after the avian influenza strain H5N1 started killing poultry and people in Southeast Asia, researchers still don't know what to make of the dangerous and unpredictable virus.

After cutting an ever-widening swath through poultry flocks and infecting - and killing - mounting numbers of people in Asia, the Middle East and Africa, the virus seemed almost to take a breather in 2008. The year that just ended saw fewer recorded human cases than any since 2003, when this cycle of H5N1 activity began. It raises the question: Is H5N1 on the wane?

Sadly, science knows too little about how flu viruses emerge, spread and jump - or don't jump - from one species to the next to answer that question. Given the knowledge gap, scientists are still pushing for pandemic preparedness.

"Whether or not H5N1 virus is going to cause a human pandemic - nobody can predict that," says Tim Uyeki, deputy chief of influenza surveillance and prevention for the U.S. Centers for Disease Control.

"I believe it's still a threat. But it's not the only threat," he adds, noting a two-month-old Chinese girl was hospitalized in Hong Kong last month with an H9N2 avian flu infection.

Whatever the uncertainty about H5N1, one thing is clear. A fog of exhaustion has settled over the influenza science community as well as the public health officials who have been slaving over pandemic plans. A healthy portion of the broader public is probably sick to death of the subject, too.

"I think flu fatigue is certainly a phrase which is thrown around a fair amount in the past several months or past year or so," admits Keiji Fukuda, head of the World Health Organization's global influenza program. "In stepping back after going through three or four years of working really hard, I think that there is a genuine sense of 'Wow! We have been pushing so hard and we are tired of that'."

After a peak of 115 human cases and 79 deaths in nine countries in 2006, human infections declined to 88 cases and 59 deaths in 2007. In 2008, only 40 human cases and 30 deaths were reported, from six countries.

Experts can only guess at why that is. "It could be just a cyclical thing," says Maria Zambon, head of the respiratory viruses unit of Britain's Health Protection Agency. "I would be cautious, I think about ... inferring long-term trends from actually reasonably limited data."

Dr. Fukuda says studies haven't shown that the virus has fundamentally changed, so the best guess is that the reason for the decline in cases probably rests with human behaviour. Efforts to eradicate infected poultry have improved, and countries that use poultry vaccine may be lowering the number of times people come in contact with the viruses as a result.

Dr. Uyeki suggests other possibilities. As the problem has seemed to wane, so has attention on it. That could be translating into more lax surveillance for new cases. Doctors could be less likely to suspect and test for H5N1 infection, attributing illness to myriad other potential causes.

It's clear the threat of a flu pandemic - caused by H5N1 or H9N2 or one of a multitude of other influenza viruses - remains. But it's also clear there are a vast number of other health problems competing for funding in highly challenging economic times.

It is a concern, Dr. Fukuda admits. "If we begin to withdraw our attention and move our attention to something else which is completely different, then we really stand to lose a lot of the work which has been built up over the past four years. To do this over and over again is truly ... it's like being Sisyphus," he says, referring to the Greek myth of a man condemned to a task that can never be completed.

OTS

Kein Vogelgrippefall in Wien

OTS, 11 Februaty 2009
https://www.ots.at/presseaussendung/OTS_20090211_OTS0073/kein-vogelgrippefall-in-wien

Wien (OTS) - Am vergangenen Montag wurden im Wiener Otto-Wagner-Spital 18 Mitarbeiterinnen eines externen Unternehmens ambulant behandelt, da vorerst nicht ausgeschlossen werden konnte, dass sie im Rahmen ihrer Arbeit mit einem Vogelgrippe-Erreger in Kontakt gekommen seien. Bei keinem der umfassenden Tests wurde eine Infektion festgestellt.****

Darüber hinaus wurden die PatientInnen umgehend mit einer Grippe-Vorsorge b71ehandelt. "Weder für die Patientinnen und Patienten noch für Personen, die mit ihnen in Kontakt waren, bestand eine Gefährdung. Selbstverständlich haben wir aber alle zuständigen Behörden informiert", erklärte Dr.in Susanne Drapalik von der Generaldirektion der Spitäler der Stadt Wien. (Schluss) cl

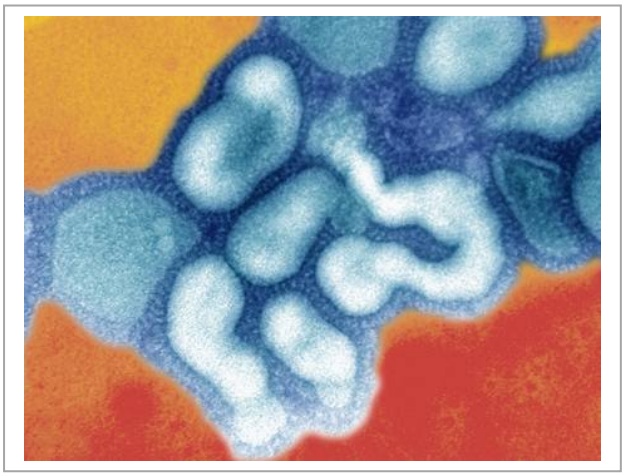
Do Česka se dostala vakcína nakažená smrtelným virem ptačí chřipky

iDNES.cz, 17 February 2009, 4:21, aktualizováno 9:43
https://www.idnes.cz/zpravy/domaci/do-ceska-se-dostala-vakcina-nakazena-smrtelnym-virem-ptaci-chripky.A090216_212758_domaci_abr

Smrtelná ptačí chřipka se ocitla v České republice a jen díky náhodě se jí nenakazili lidé. Společnost Biotest v Konárovicích na Kolínsku testovala vakcínu rakouské farmaceutické firmy Baxter, která ji vyvíjí. Jenže vakcína obsahovala i agresivní virus ptačí chřipky H5N1.



Státní veterinární správa odhalila, že zvířata byla nakažena smrtelným virem ptačí chřipky. Ilustrační foto. | foto: Profimedia.cz

Rakušané to zjistili několik týdnů po začátku testů. Ale to už bylo pozdě.

"Vakcínu v Biotestu testovali na fretkách od začátku ledna. Výzkum byl povolen ministerstvem průmyslu a obchodu. Najednou začaly fretky hynout a výzkum byl ukončen 6. února," říká hlavní hygienik Michael Vít. V bezprostřední blízkosti viru se výzkumníci pohybovali od 30. ledna.

Následně Státní veterinární správa odhalila, že zvířata byla nakažena smrtelným virem ptačí chřipky. "Všechny fretky jsme museli zlikvidovat a firmu zavřít," říká mluvčí veterinářů Josef Duben. K dezinfekčním opatřením nasadili sedmdesátiprocentní etanol, který podle Dubna "dokonale zabíjí vše živé".

Lék ihned dostalo třináct lidí

V nebezpečí se rázem ocitli všichni, kdo přišli s nakaženými fretkami do styku. "Třináct lidí okamžitě dostalo lék Tamiflu a všichni prošli testy. Naštěstí se ukázalo, že nikdo nebyl nakažen. I když už mají inkubační dobu za sebou, přesto je nadále testujeme na výskyt možných protilátek v krvi," dodává Vít.

Pokud by nějaký výzkumník byl nakažen, mohl před vyšetřením nakazit spoustu lidí. Že se vir nerozšířil na další obyvatele jen díky štěstí, připouštějí i sami odborníci.

Podobný případ v Česku veterináři ani hygienici nepamatují. "Je to vážné varování, žádná legrace to nebyla," říká Duben. Firma Baxter přiznává, že chyba se stala už v Rakousku a přes hranice posílala již "nakaženou zásilku".

"Stalo se to zřejmě při balení. Informovali jsme testující společnost," uvádí Richard Tischler z firmy Baxter. Podle něho dostalo lék Tamiflu dokonce devětadvacet lidí.

Kontrolní systém není příliš hloubkový

Při vývoji léků je pro testy na zvířatech zapotřebí jen povolení ministerstva průmyslu a obchodu, které však o lécích a jejich rizicích jinak nic neví. A schválení etické komise ministerstva zemědělství, že se se zvířaty bude zacházet dobře.

Potíž je také v tom, že při podobných testech v České republice zákony chrání víc zvířata než lidi. "Pečlivě se staráme o etickou stránku testů na zvířatech, ale že jsou tu vážná rizika pro lidi, to nikdo neřeší," říká ředitel Státního ústavu pro kontrolu léčiv Martin Beneš.

MEDICAL TRIBUNE

Lidem hrozila nákaza smrtící ptačí chřipkou

Medical Tribune, 17 February 2009
https://www.tribune.cz/zdravotnictvi/lidem-hrozila-nakaza-smrtici-ptaci-chripkou/

Smrtelná ptačí chřipka se ocitla v České republice a jen díky náhodě se jí nenakazili lidé.

Jak se sem vir dostal? Společnost Biotest v Konárovicích na Kolínsku testovala vakcínu rakouské farmaceutické firmy Baxter, která ji vyvíjí. Jenže vakcína navíc obsahovala i agresivní virus ptačí chřipky H5N1. Rakušané to zjistili týden po začátku testů. Ale to už bylo pozdě.

"Vakcínu v Biotestu testovali na fretkách od konce ledna. Výzkum byl povolen ministerstvem průmyslu a obchodu. Najednou začaly fretky hynout a výzkum byl ukončen 6. února," říká hlavní hygienik Michael Vít.

Následně Státní veterinární správa odhalila, že zvířata byla nakažena smrtelným virem ptačí chřipky. "Všechny fretky jsme museli zlikvidovat a firmu zavřít," říká mluvčí veterinářů Josef Duben.

V nebezpečí se rázem ocitli všichni, kdo přišli s nakaženými fretkami do styku.

"Třináct lidí okamžitě dostalo lék Tamiflu a všichni prošli testy. Naštěstí se ukázalo, že nikdo nebyl nakažen. I když už mají inkubační dobu za sebou, přesto je nadále testujeme na výskyt možných protilátek v krvi," dodává Vít.

Podobný případ v Česku veterináři ani hygienici nepamatují. "Je to vážné varování, žádná legrace to nebyla," říká Duben.

Firma Baxter přiznává, že chyba se stala už v Rakousku a přes hranice posílala již "nakaženou zásilku".

"Stalo se to zřejmě při balení. Informovali jsme testující společnost," uvádí Richard Tischler z firmy Baxter. Lidé ohrožení ptačí chřipkou z vadné vakcíny jsou v pořádku

Novinky.cz, 17 February 2009, 13:52
https://www.novinky.cz/domaci/clanek/lide-ohrozeni-ptaci-chripkou-z-vadne-vakciny-jsou-v-poradku-40219468

Hlavní hygienik ČR Michael Vít

Všechny osoby, jimž v souvislosti s testováním nové chřipkové vakcíny hrozilo, že se mohly nakazit virem ptačí chřipky, jsou v pořádku. Právu to v úterý potvrdil Hlavní hygienik ČR Michael Vít.

„Dnes už uplynula dvojnásobná doba inkubace pro eventuální nakažení virem ptačí chřipky a nic se nestalo. Lidé jsou v pořádku. Jim ani nikomu jinému žádné nebezpečí nehrozí," řekl Vít.

Reagoval tak na informaci, že agresivní ptačí virus chřipky H5N1 nedopatřením obsahovala vakcína rakouské farmaceutické firmy Baxeter, kterou testovala společnost Biotest v Konárovicích na Kolínsku.

„Testy se prováděly s chřipkovou vakcínou typu H3N2 od 30. ledna. Pokusné fretky začaly mít zdravotní potíže 6. února a některé uhynuly. Tentýž den jsme se o tom dověděli a učinili patřičná opatření," prohlásil Vít.

Zaměstnanci dostali protilátku

Informoval, že všichni, kdo se dostali do kontaktu s pokusnými zvířaty, nebo se jinak zapojili do pokusu, dostali okamžitě antivirový přípravek Tamiflu. Všichni byli také vyšetřeni nejmodernější molekulární metodou, aby se vyloučila možnost, že se nakazili agresivním virem ptačí chřipky H5N1.

„Nikdo nebyl nakažen," řekl Vít s tím, že hygienici spolupracovali s veterinární správou. Ta podle Víta skutečně odhalila, že zvířata byla nakažena smrtelným virem ptačí chřipky H5N1. „Všechny fretky byly zlikvidovány a farma prošla a prochází rozsáhlou dezinfekcí všech prostor," dodal Vít.

Podle mluvčího Státní veterinární správy Josefa Dubna to ale „žádná legrace nebyla". Firma Baxter přiznala, že chyba se stala už v Rakousku a přes hranice do Čech již putovala nakažená zásilka. Stalo se tak zřejmě při balení.

Avian Flu Diary

Austrian firm sent deadly vaccine for testing in Czech Republic

Avian Flu Diary, by DPA, 17 February 2009, 15:18:01 GMT
https://afludiary.blogspot.com/2009/02/ferreting-out-problem-in-laboratory.html

Prague – An Austrian pharmaceutical firm sent a flu vaccine, which it had accidentally contaminated with the deadly H5N1 bird flu virus, for testing in the Czech Republic, a report said Tuesday, DPA reported.

The Austrian firm Baxter said it contaminated the vaccine with the dangerous virus by accident, likely during packaging in Austria, the Mlada Fronta Dnes daily reported, citing Baxter's representative.

Baxter shipped the infected vaccine to the Czech biomedical firm Biotest for testing on ferrets in late January.

None of Biotest's 13 employees, who had been exposed to the highly pathogenic virus for a week, contracted the disease.

According to the World Health Organization figures, the bird flu has killed 254 people, mostly in Asia and Africa, including four deaths reported in Turkey.

The Czech Republic's chief epidemiologist Michael Vit said that it was unclear whether the Biotest workers had been under a high risk of infection as the Czech authorities did not know how much virus the vaccine contained.

Officials, however, hinted that the situation could have been serious. "Thank God it did not spread," Vit said.

The Czech company managed to prevent the virus from spreading outside the lab to poultry breeds, which would have had to be culled in such an event.

"If it were to spread to poultry farms it would have caused serious problems," said Josef Duben, a spokesman for the Czech State Veterinary Administration.

The exposed employees were given Tamiflu medicine and have been regularly tested, Vit said.

The infected ferrets had to be culled and the laboratory, which is located 70 kilometres east of the Czech capital Prague, was disinfected.

Czech Republic: H5N1 lab exposure. Contaminated vaccine

PoultryMed, 17 February, 2009

https://web.archive.org/web/20090314011934/http://www.poultrymed.com/Poultry/Templates/showpage.asp?DBID=1&LNGID=1&TMID=178&FID=604&PID=0&IID=6629

An Austrian pharmaceutical firm sent a flu vaccine, which it had accidentally contaminated with the H5N1 avian influenza virus, for testing in the Czech Republic. The Austrian firm Baxter said it contaminated the vaccine by accident, likely during packaging in Austria. Baxter shipped the infected vaccine to the Czech biomedical firm Biotest for testing on ferrets in late January. The contaminated product, which Baxter calls "experimental virus material," was made at the Orth-Donau research facility. The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany. The World Health Organization's European operation is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

Baxter's error is reminiscent of a 2005 incident where a U.S. manufacturer of kits used by laboratories to test their detection capabilities included vials of H2N2 virus in several thousand proficiency kits.

The US Food and Drug Administration (FDA) announced on 5th March 2008, they had found evidence that the heparin blood thinning product made by Baxter was contaminated. 19 people have died and 785 were reported to be gravely ill of severe allergic reactions after receiving injections of Baxter's heparin.

Ferreting Out A Problem In the Laboratory

Avian Flu Diary, by DPA, 17 February 2009

https://afludiary.blogspot.com/2009/02/ferreting-out-problem-in-laboratory.html

In what could have been a major incident, we are just now learning about a mix-up with experimental vaccines being tested at a laboratory in the Czech Republic.

According to early news reports an experimental (presumably seasonal flu) vaccine was contaminated at the factory with the H5N1 virus and sent off to a laboratory for testing on ferrets.

Some of the ferrets died, which set off alarm bells.

Surviving ferrets were culled and employees of the lab were immediately placed on Tamiflu. Luckily none were reported to have been infected by the virus.

This report from DPA.

Слабые места закона о тестировании выявила нелицеприятная история с продукцией австрийской фармацевтической фирмы Baxter, производящей вакцину.

С конца января вакцину тестировало на хорьках общество Biotest в Конаровицах Колинской области. Исследование было разрешено министерством промышленности и торговли.

Слабые места закона о тестировании выявила нелицеприятная история с продукцией австрийской фармацевтической фирмы Baxter, производящей вакцину. С конца января вакцину тестировало на хорьках общество Biotest в Конаровицах Колинской области. Исследование было разрешено министерством промышленности и торговли.

Препарат, однако, содержал и смертельно опасный вирус птичьего гриппа H5N1, который, видимо, попал в посылку во время упаковки. Австрийцы выяснили это спустя неделю после начала тестирования, уточняет ежедневник MLADÁ FRONTA DNES. Оказалось, поздно. Хорьки погибали один за другим.

Тестирование, по словам главного санврача Чехии Михаела Вита, 6 февраля остановили. Управление ветеринарного надзора констатировало: зверьки заразились вирусом птичьего гриппа. Тринадцать работников, тестировавших злополучную вакцину, немедленно начали принимать Tamiflu и прошли обследование.

К счастью, пока все в порядке. Инкубационный период завершился, оставив за собой вопрос, в достаточной ли мере охраняет законодательная норма тех, кто подвергается смертельному риску?

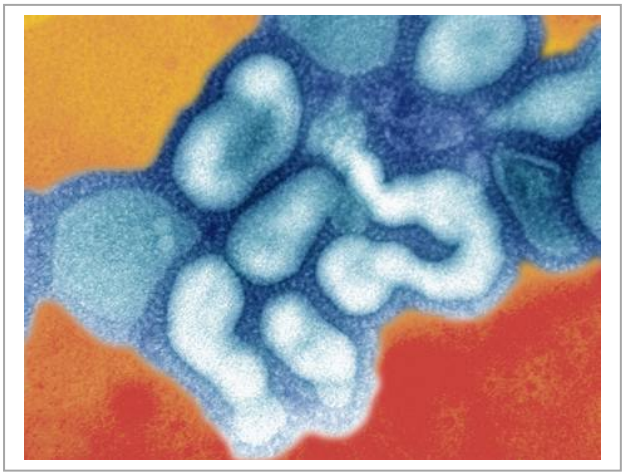
iDNES.cz / ZPRAVODAJSTVÍ Domácí Zahraničí Krimi Kraje Volby Ekonomika Kultura

Bohdana Jarošová, Jan Gazdík

Je to obchodní tajemství, odmítá firma komentovat únik smrtelné vakcíny

iDNES, 18 February 2009, 4:07
https://www.idnes.cz/zpravy/domaci/je-to-obchodni-tajemstvi-odmita-firma-komentovat-unik-smrtelne-vakciny.A090217_224441_domaci_anv

Rakouskou pobočku americké farmaceutické společnosti Baxter prověřuje Evropská agentura pro léčivé přípravky (EMEA). Stalo se tak poté, co farmaceuti z rakouského Ortha poslali do České republiky na testy vakcíny proti chřipce, které byly nakaženy smrtelným virem ptačí chřipky H5N1.



V rakouské laboratoři zkoumají, jak mohl uniknout virus ptačí chřipky do Česka. Kontroly téměř nebyly. | foto: Profimedia.cz

Kvůli případu, na který upozornila MF DNES, se budou zřejmě měnit zákony.

"Chceme docílit toho, aby každá vakcína nebo lék, které přicházejí do České republiky na testování, měly dokumentaci, vyšetření, že nejsou ničím kontaminovány. Nebo jsme si je mohli sami prošetřit v Národní referenční laboratoři. Dosud tomu tak nebylo," upozorňuje hlavní hygienik a náměstek ministryně zdravotnictví Michael Vít.

Výzkumná společnost Biotest z Konárovic na Kolínsku, jež vakcínu testovala na fretkách, musela po týdnu testy ukončit a nakažená zvířata usmrtit. Třináct lidí, kteří pracovali s vakcínou, dostalo okamžitě antivirový lék Tamiflu a stále jsou pod mimořádným dozorem hygieniků.

"Podle laboratorních testů naštěstí lidé nakažení nejsou," sdělil Vít. Dotčené laboratoře v Konárovicích se nyní čistí. "Připravujeme je opět ke zprovoznění," říká Jan Zábský ze společnosti Biotest.

Výzkum na fretkách řádně povolilo ministerstvo průmyslu a obchodu. Ročně jeho resortní komise dá souhlas více než stovce podobných výzkumů. Problém je, že nemá žádné kontrolní pravomoci.

Nově by všechny výzkumy mělo mít pod dozorem ministerstvo zdravotnictví společně se Státním ústavem pro kontrolu léčiv. Jeho pracovníkům teď Rakušané budou muset vysvětlit, kde se stala chyba a kdo je za ni zodpovědný.

"Byla to procesní chyba, která se odehrála v naší pobočce, nemohu vám však sdělit podrobnosti. Odhalil bych naše obchodní tajemství. Mohu vás však ujistit, že jsme okamžitě učinili opatření, aby se podobná chyba už nestala," řekl MF DNES mluvčí americké společnosti Baxter Richard Tischler.

Podle něj se chyba týkala pouze dodávky pro českou firmu Biotest. Baxter je jedna ze šesti mezinárodních firem, které mají oprávnění vyvíjet vakcíny proti chřipce. Ve svých laboratořích uchovává i smrtelný virus ptačí chřipky, protože vyrábí vakcíny i proti němu.

Díra v zákonech

V Konárovicích se testovala vakcína, která byla určena na chřipku pro Evropany v příští sezoně. O tom, jak se mohlo stát, že byl "nebezpečný virus" přibalen do české zásilky, teď odborníci jednají.

Něco podobného se v Česku ještě nestalo. "Je to mimořádná věc. Nepamatuji se, že by se v této oblasti něco stalo. Je to díra v legislativě, na kterou jsme nebyli připraveni," míní Roman Prymula, předseda České vakcinologické společnosti.

Podle něj se v Česku testuje obrovské množství látek, ale málo z nich náleží do nejnebezpečnější kategorie. Tyto pokusy pak podléhají zvláštním bezpečnostním opatřením.

"Nemá cenu si zastírat, že jde o obrovský průšvih. Na podobný omyl doplatily naposledy v USA před šedesáti lety děti, které dostaly obrnu. O něco později v Německu zaměnili vědci vakcíny proti tuberkulóze. Očkovaní lidé pak touto chorobou onemocněli," říká šéf Centra očkování a cestovní medicíny Jiří Beran.

Czech researchers exposed to bird flu virus

Xinhua.Net, 18 February 2009, 09:53
https://web.archive.org/web/20090219235701/http://news.xinhuanet.com/english/2009-02/18/content_10838633.htm

PRAGUE, Feb. 17 (Xinhua) -- Thirteen Czech researchers have been exposed to the H5N1 bird flu virus strain through a contaminated vaccine obtained from an Austrian company, a newspaper reported Tuesday.

The 13 people who had contact with the ferrets were in danger but were not infected with the lethal virus, said Josef Duben, a spokesman for the Czech veterinary authority.

Duben told the Mlada fronta Dnes (MfD) that the researchers were given an anti-viral vaccine and underwent tests.

"Fortunately, none of them got infected," Duben said.

The bird flu virus was being tested positive on ferrets by the Biotest company in Konarovice when the animals began to die.

"Suddenly the ferrets started dying, so the research stopped onFeb. 6," said Michael Vit, the Czech chief sanitary official.

Officials said the ferrets had become infected with the lethal bird flu virus and to be euthanized.

Baxter, the Austrian pharmaceutical company that developed the vaccine, admitted that it mistakenly sent infected material to the Czech Republic.

Česká televize

Smrtící virus ptačí chřipky dorazil do ČR ve vakcíně

CT24, 18 February 2009
https://ct24.ceskatelevize.cz/domaci/1420633-smrtici-virus-ptaci-chripky-dorazil-do-cr-ve-vakcine

Konárovice (Kolínsko) - Smrtelný virus ptačí chřipky H5N1 se dostal do Česka. Společnost Biotest testovala vakcínu rakouské firmy Baxter, látka však nedopatřením obsahovala zmíněný virus. Rakouská firma to odhalila až týden po zahájení testů. Po kontaktu s nakaženými pokusnými fretkami se do přímého ohrožení života dostalo 13 lidí. Nikdo z nich se ptačí chřipkou nenakazil.

Smrtící virus ptačí chřipky dorazil do ČR ve vakcíně
Autor: ČT24; Zdroj: ČT24

„Dnes už uplynula dvojnásobná doba inkubace pro eventuální nakažení virem ptačí chřipky a nic se nestalo. Lidé jsou v pořádku. Jim ani nikomu jinému žádné nebezpečí nehrozí," řekl hlavní hygienik ČR Michael Vít s tím, že všichni ihned dostali lék Tamiflu a prošli řadou testů novou molekulární metodou.

Testy s chřipkovou vakcínou se podle Víta prováděly v Konárovicích od konce ledna. Po týdnu ale začaly pokusné fretky hynout a Rakušané vzápětí informovali o přítomnosti smrtícího viru ve vakcíně. Firma Baxter přiznala svou chybu. „K té chybě došlo u nás. Došlo k záměně chřipkového virotika u jednotlivých druhů vakcín, po celou tu dobu nebylo riziko vyšší, než je u běžných vakcín," vyjádřil se pro ČT mediální zástupce firmy Baxter v ČR Václav Pavelka.

Veterináři a hygienici se shodují na alarmující povaze celé události. Hlavní hygienik se pod tíhou celé události nechal slyšet, že bude usilovat o změnu legislativy, aby testování vakcín při pokusech na zvířatech schvalovalo v budoucnu pouze ministerstvo zdravotnictví.

13 Mitarbeiter eines tschechischen Labors eine Woche lang unbemerkt H5N1-Viren ausgesetzt - Rätselhafte Verbindung zu ähnlichem Fall in Österreich

PR-Inside, 22 February 2009, 15:57
https://web.archive.org/web/20090310124253/http://www.pr-inside.com/de/mitarbeiter-eines-tschechisch-r1073187.htm

(PR-inside.com 22.02.2009 15:57:23) – Eine Lieferung von mit hoch pathogenen H5N1 Viren kontamierten Grippeimpfstoffs von Österreich nach Tschechien sorgt für Gefährdung von 13 Labormitarbeitern. Zeitgleich werden 18 Mitarbeiter eines österreichischen Pharmalabors im Wiener Otto-Wagner-Spital gegen "Vogelgrippe" behandelt.

Meldungen tschechischer Medien zufolge kam es in einem Labor der 70 km östlich der Hauptstadt Prag gelegenen Biotest Ltd. in Konarovice zu einem schwerwiegendem Zwischenfall durch mit hoch pathogenen H5N1 Viren kontaminiertem Impfstoff.

Nach dem Wissenschaftforum Aviäre Influenza (WAI) vorliegenden Informationen ereignete sich der Vorfall bereits am 06. Februar diesen Jahres. Der experimentelle Impfstoff war am 30.01.2009 von der Avir Green Hills Biotechnology GmbH im Auftrag des Wiener Pharma Herstellers Baxter an das Labor der Biotest Ltd. in Tschechien geliefert worden, wo dieser im Tierversuch an Frettchen getestet werden sollte.

Als im Rahmen der Tierversuche die Frettchen begannen Krankheitssymptome zu zeigen und einige der Tiere starben, wurde der aus Österreich gelieferte Impfstoff untersucht und eine Kontamination mit dem auch für Menschen gefährlichen Vogelgrippe-Erreger H5N1 festgestellt. 13 Labormitarbeitern der Biotest Ltd., welche über einen Zeitraum von annähernd einer Woche im Rahmen ihrer Arbeit Kontakt zu dem hoch pathogenen Erreger hatten, wurden präventiv antivirale Medikamente verabreicht. Zu einer Infektion des Laborpersonals kam es offenbar glücklicherweise nicht.

Bislang ungeklärt sind auch die Zusammenhänge des Laborzwischenfalls in Tschechien zu einer Meldung des Presse- und Informationsdienstes der Stadt Wien vom 11.02. in welchem es heißt, dass im Wiener Otto-Wagner-Spital, Zitat: 18 MitarbeiterInnen eines externen Unternehmens ambulant behandelt [wurden], da vorerst nicht ausgeschlossen werden konnte, dass sie im Rahmen ihrer Arbeit mit einem Vogelgrippe-Erreger in Kontakt gekommen seien'

Nach Auffassung des WAI ergibt sich indes möglicherweise ein Kausalzusammenhang mit einer zeitgleich in Wien stattfindenden Phase I Studie eines H5N1-Lebendimpfstoffs des österreichischem Pharmaherstellers Baxter, im Rahmen derer ein als Nasenspray konzipierter Vogelgrippeimpfstoff an Menschen getestet wird. Ob sich die Kontamination der Impfstoffe tatsächlich auf die an Menschen durchgeführte Phase I Studie in Wien ausgewirkte ist ungeklärt, würde aber plausibel zu erklären vermögen, warum am 11.02. - fünf Tage nach einem Laborzwischenfall durch kontaminierten Impfstoff in Tschechien - im österreichischem Wien 18 Menschen im Otto-Wagner-Spital präventiv gegen H5N1 behandelt werden müssen.

Obwohl der Laborzwischenfall mittlerweile als Biological Hazard vom EDIS 'Emergency and Desaster Service) unter der Kennung BH-20090217-20552-CZE gelistet ist, sah sich Baxter bislang zu keiner öffentlichen Stellungnahme genötigt.

Das Wissenschaftsforum Aviäre Influenza fordert daher mit Nachdruck eine vollständige und detaillierte Offenlegung der Umstände, welche zur Kontamination eines Impfstoffs mit hoch pathogenen Erregern geführt haben.

Bereits im Jahre 2004 kam es zu einer Kontamination von Impfstoffen. Der Pharmahersteller Chiron (heute Teil der Schweizer Novartis AG) hatte damals 46 Millionen Dosen des Grippeimpfstoffs Fluvirin auf Grund bakterieller Verseuchung vernichten müssen.

13 Employees of a Czech laboratory for a week unnoticed H5N1 viruses suspended

Cottontop, 25 February 2009
https://cottontopssandbox.wordpress.com/2009/02/25/13-employees-of-a-czech-laboratory-for-a-week-unnoticed-h5n1-viruses-suspended/

Puzzling connection to a similar case in Austria.(PR-inside.com 22.02.2009 15:57:23)

A supply of highly pathogenic H5N1 influenza virus vaccine contaminated of Austria to the Czech Republic provides for risks of 13 laboratory staff. At the same time, 18 employees of an Austrian pharmaceutical laboratories in Vienna Otto Wagner Spital against “bird flu” theme.

Czech media reports that it came in a laboratory of the 70 km east of Prague situated Biotest Ltd. in Konarovice in a serious incident by highly pathogenic H5N1 virus contaminated vaccine.

According to the Scientific Forum Avian Influenza (WAI) the information the incident took place already on 06 February this year. im The experimental vaccine was on 30.01.2009 by Avir Green Hills Biotechnology GmbH. Behalf of the pharmaceutical company Baxter Vienna to the laboratory of Biotest Ltd. has been delivered in the Czech Republic, where in this animal to be tested ferrets.

As part of the animal in the ferrets began to show symptoms and some of the animals died, was from Austria delivered vaccine investigated and any contamination with hazardous for human-pathogen avian flu H5N1 found. 13 laboratories of Biotest Ltd employees. which over a period of approximately one week as part of their work contact with the highly pathogenic agents were preventive antiviral drugs. For an infection of the laboratory staff did not seem fortunately.

So far unexplained is the relationship of the laboratory incident in the Czech Republic to a report of the Press and Information Service of the City of Vienna 11.02. in which it is stated that the Vienna Otto Wagner Hospital, Citation: 18 employees of an outside company out-patients [were], because the moment could not be excluded that in the context of their work with a bird flu pathogen had been in contact.

According to the WAI arises, however, may be a causal link with a simultaneously taking place in Vienna Phase I study of an H5N1 vaccine live in the Austrian pharmaceutical company Baxter, under which a designed as a nasal spray bird flu vaccine tested on humans. Whether the contamination of the vaccines actually in human phase I study in Vienna effect is unclear, but it would plausible to explain why at 11.02. – Five days after a laboratory accident by contaminated vaccine in the Czech Republic – Austria Vienna in 18 people in the Otto-Wagner-Spital preventively against H5N1 should be treated.

Although the laboratory incident is now the Biological Hazard from EDIS ‘Emergency and Disaster Services), under the name BH-20090217-20552-CZE is listed, Baxter had been no public opinion forced.

The Science Forum avian influenza, therefore, strongly urges a full and detailed disclosure of the circumstances for which a vaccine contamination with highly pathogenic agents have led.

Already in 2004 there was a contamination of vaccines. The pharmaceutical manufacturer Chiron (now part of Switzerland’s Novartis AG) had 46 million doses of Fluvirin flu vaccine due to bacterial contamination must be destroyed.

Bloomberg

Baxter Sent Bird Flu Virus to European Labs by Error

Bloomberg, 24 February 2009, 16:20 EST
https://web.archive.org/web/20110715234330/http://www.bloomberg.com/apps/news?pid=newsarchive&sid=aTo3LbhcA75I

Feb. 24 (Bloomberg) - Baxter International Inc. in Austria unintentionally contaminated samples with the bird flu virus that were used in laboratories in three neighboring countries, raising concern about the potential spread of the deadly disease.

The contamination was discovered when ferrets at a laboratory in the Czech Republic died after being inoculated with vaccine made from the samples early this month. The material came from Deerfield, Illinois-based Baxter, which reported the incident to the Austrian Ministry of Health, Sigrid Rosenberger, a ministry spokeswoman, said today in a telephone interview.

“This was infected with a bird flu virus,” Rosenberger said. “There were some people from the company who handled it.”

The material was intended for use in laboratories, and none of the lab workers have fallen ill. The incident is drawing scrutiny over the safety of research using the H5N1 bird flu strain that’s killed more than three-fifths of the people known to have caught the bug worldwide. Some scientists say the 1977 Russian flu, the most recent global outbreak, began when a virus escaped from a laboratory.

The virus material was supposed to contain a seasonal flu virus and was contaminated after “human error,” said Christopher Bona, a spokesman for Baxter, in a telephone interview.

‘Sanitized’

Baxter “moved very quickly to sanitize and protect employees,” Bona said. “Labs have been sanitized, potentially contaminated materials have been destroyed and employees were tested and considered not to be at risk.”

Baxter gained 93 cents, or 1.6 percent, to $58.27 at 4 p.m. in New York Stock Exchange composite trading, and has lost 2.3 percent over the last 12 months.

The Austrian health ministry reported the incident to the European Union and is conducting its own audit, Rosenberger said. In response, Baxter said it has put in place “preventive and corrective” measures that the ministry found satisfactory. The vaccine has been destroyed, according to Rosenberger.

The World Health Organization “is aware of the situation and is consulting with the ministers of health of the countries involved to ensure that all public risks arising from this event have been identified and managed appropriately,” said Gregory Hartl, a spokesman in Geneva.

European Agencies

The European Medicines Agency has no immediate comment, said Monika Benstetter, an agency spokeswoman. The U.S. Centers for Disease Control and Prevention, which distributes seasonal flu viruses to companies for vaccine manufacturing, isn't investigating or providing consultation, said Tom Skinner, a spokesman for the Atlanta-based agency. The CDC is staying in touch with the European Centre for Disease Prevention and Control regarding the incident, Skinner said.

The H5N1 strain of avian flu has been monitored by health officials around the world for more than a decade for signs it could mutate into a form that is easily spread among humans. Currently, it passes mainly among infected poultry.

A flu pandemic of avian or other origin could kill more than 70 million people worldwide and lead to a "major global recession" costing more than $3 trillion, according to a worst- case scenario outlined by the World Bank in October.

H5N1 has infected at least 408 people in 15 countries since 2003, killing 63 percent of them, according to the Web site of the Geneva-based WHO.

Flu Pandemic

BioTest s.r.o, a Czech biotechnology company, was conducting research for a company called AVIR Green Hills Biotechnology using materials supplied by Baxter. The company was "supposed to get non-infected testing vaccine, which was by mistake of the supplier contaminated with the H5N1 virus," BioTest said in a statement last week.

AVIR Green Hills monitored its lab workers for signs of illness and got access to Roche Holding AG's Tamiflu antiviral in case of infections, said Birgit Kofler-Bettschart, a spokeswoman for the closely held, Vienna-based company. AVIR Green Hills sanitized its laboratories, destroyed potentially contaminated samples, and told health officials, she said in an e-mail today.

Three influenza pandemics, including the 1918 Spanish flu that killed more than 50 million people, have occurred since 1900.

Threats

Another three pandemic threats – situations where a global epidemic is close to occurring - have occurred. One was the Russian flu of 1977.

The H5N1 virus, "even if it were let out of the lab, would be only lethal for birds in its present state," said Ilaria Capua, a veterinary virologist, whose laboratory in Padova, Italy, handles some of the avian-flu screening for the World Organization for Animal Health. Capua said she has no knowledge of the situation. "In Europe, we can react fast" to outbreaks of the disease in animals, she said.

Baxter, the world's largest maker of blood-disease treatments, is one of the companies working on a vaccine to be used in case of a flu pandemic. The European Medicines Agency recommended approval of Baxter's Celvapan, the first cell culture-based vaccine for bird flu in Europe, in December.

Officials investigate how bird flu viruses were sent to unsuspecting labs

The Canadian Press, 25 February 2009, before 9:23 AM
https://afludiary.blogspot.com/2009/02/more-on-baxter-vaccine-story.html

Officials are trying to get to the bottom of how vaccine manufacturer Baxter International Inc. made "experimental virus material" based on a human flu strain but contaminated with the H5N1 avian flu virus and then distributed it to an Austrian company.

That company, Avir Green Hills Biotechnology, then disseminated the supposed H3N2 virus product to subcontractors in the Czech Republic, Slovenia and Germany. Authorities in the four European countries are looking into the incident, and their efforts are being closely watched by the World Health Organization and the European Centre for Disease Control.

Though it appears none of the 36 or 37 people who were exposed to the contaminated product became infected, the incident is being described as "a serious error" on the part of Baxter, which is on the brink of securing a European licence for an H5N1 vaccine. That vaccine is made at a different facility, in the Czech Republic.

"For this particular incident ... the horse did not get out (of the barn)," Dr. Angus Nicoll of the ECDC said from Stockholm.

"But that doesn't mean that we and WHO and the European Commission and the others aren't taking it as seriously as you would any laboratory accident with dangerous pathogens – which you have here."

Accidental release of a mixture of live H5N1 and H3N2 viruses – if that indeed happened – could have resulted in dire consequences. Nicoll said officials still aren't 100 per cent sure the mixture contained live H5N1 viruses. But given that ferrets exposed to the mixture died, it likely did.

H5N1 doesn't easily infect people, but H3N2 viruses do. They are one of two types of influenza A viruses that infect people each flu season.

If someone exposed to the mixture had been co-infected with H5N1 and H3N2, the person could have served as an incubator for a hybrid virus able to transmit easily to and among people. That mixing process, called reassortment, is one of two ways pandemic viruses are created.

Research published last summer by scientists at the U.S. Centers for Disease Control found that in the laboratory, H5N1 and H3N2 viruses mated readily. While less virulent than H5N1, a number of the offspring viruses appeared to retain at least a portion of the killing power of their dangerous parent.

Baxter International, which is based in Deerfield, Ill., said the contamination was the result of an error in its research facility in Orth-Donau, Austria.

The facility had been contracted by Avir Green Hills to make what Baxter refers to as "experimental virus material" based on human H3N2 viruses.

Christopher Bona, Baxter's director of global bioscience communications, said the liquid virus product was not a vaccine and was developed for testing purposes only. He deferred questions about

the purpose of the testing to Avir Green Hills, but said the batch was to be used in animals and was never intended for use in humans.

Avir Green Hills said in an email that it took possession of the material in late December. It later sent the product to the sub-contractors. The email said the material was stored and handled throughout under high biosafety conditions.

Alarm bells rang in early February when researchers at the Czech sub-contractor inoculated ferrets with the material and the animals promptly died. Baxter learned about the problem on Feb. 6, Bona said from Deerfield.

Ferrets are susceptible to human flu strains, but they don't die from those infections. Preliminary investigation found the material was contaminated with H5N1 flu virus, which is lethal to ferrets.

Nicoll said the fact the ferrets died supports the working assumption that there were live H5N1 viruses in the material Baxter produced.

Bona said Baxter has identified how the contamination happened and has taken steps to ensure it doesn't happen again. He said Austrian authorities audited Baxter's Orth-Donau research operations after the problem came to light and are satisfied with the steps taken.

Baxter is the only flu vaccine manufacturer to work with wild type flu viruses, felt to be more dangerous than the altered and attenuated (weakened) viruses other manufacturers use.

The company uses what is known as BSL3 level precautions in all its vaccine research facilities, Bona said. (Researchers at the U.S. CDC use BSL3-plus biocontainment when working with H5N1 viruses, a spokesperson for the agency said.)

People familiar with biosecurity rules are dismayed by evidence that human H3N2 and avian H5N1 viruses have somehow co-mingled in the Baxter research facility. That should not be allowed to happen, a number of experts insisted.

The company isn't shedding much light on how it did.

"It was a combination of just the process itself, (and) technical and human error in this procedure," Bona said. When asked to elaborate, he said to do so would give away proprietary information about Baxter's production process.

Bona said when Baxter realized its error, it helped the various companies destroy the contaminated material and clean up their facilities. And staff who had been exposed to the contaminated product were assessed and monitored by infectious diseases doctors. They were also offered the antiviral drug oseltamivir (Tamiflu).

Baxter's error is reminiscent of a 2005 incident where a U.S. manufacturer of kits used by laboratories to test their detection capabilities included vials of H2N2 virus in several thousand proficiency kits. H2N2, the virus that caused the 1957 pandemic, has not circulated since 1968 and is thought to be a prime candidate to cause the next pandemic.

That mistake, discovered by Canada's National Microbiology Laboratory, set authorities around the world scrambling to retrieve and destroy the vials of virus, which had been sent to labs in 18 countries.

A statement on behalf of Baxter

I would like to provide the following update to a posting on ProMED dated 25 Feb 2009 (Avian influenza, accidental distribution – Czech Rep. ex Austria: RFI).

The H5N1 strain was the A/Vietnam/1203/2004 strain, received from a WHO reference centre. All information concerning this incident has been provided to the involved national authorities and appropriate international bodies such as ECDC and WHO. –

Christopher Bona
Director, Global BioScience Communications

Baxter admits contaminated seasonal flu product contained live bird flu virus

The Canadian Press, 26 February 2009
https://web.archive.org/web/20090304160508/http://www.google.com/hostednews/canadianpress/article/ALeqM5iV_RT6oBK3tOhtsWf5pnu5OIby9w

The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses.

And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by the four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died. Ferrets shouldn't die from exposure to human H3N2 flu viruses.

Public health authorities concerned about what has been described as a "serious error" on Baxter's part have assumed the death of the ferrets meant the H5N1 virus in the product was live. But the company, Baxter International Inc., has been parsimonious about the amount of information it has released about the event.

On Friday, the company's director of global bioscience communications confirmed what scientists have suspected.

"It was live," Christopher Bona said in an email.

The contaminated product, which Baxter calls "experimental virus material," was made at the Orth-Donau research facility. Baxter makes its flu vaccine -- including a human H5N1 vaccine for which a licence is expected shortly – at a facility in the Czech Republic.

People familiar with biosecurity rules are dismayed by evidence that human H3N2 and avian H5N1 viruses somehow co-mingled in the Orth-Donau facility. That is a dangerous practice that should not be allowed to happen, a number of experts insisted.

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences.

While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.

That mixing process, called reassortment, is one of two ways pandemic viruses are created.

There is no suggestion that happened because of this accident, however.

"We have no evidence of any reassortment, that any reassortment may have occurred," said Andraghetti.

"And we have no evidence of any increased transmissibility of the viruses that were involved in the experiment with the ferrets in the Czech Republic."

Baxter hasn't shed much light – at least not publicly – on how the accident happened. Earlier this week Bona called the mistake the result of a combination of "just the process itself, (and) technical and human error in this procedure."

He said he couldn't reveal more information because it would give away proprietary information about Baxter's production process.

Andraghetti said Friday the four investigating governments are co-operating closely with the WHO and the European Centre for Disease Control in Stockholm, Sweden.

"We are in very close contact with Austrian authorities to understand what the circumstances of the incident in their laboratory were," she said.

"And the reason for us wishing to know what has happened is to prevent similar events in the future and to share lessons that can be learned from this event with others to prevent similar events. ... This is very important."

Baxter International "Unintentionally" Sent Flu Samples to Companies that Contained H5N1 Avian Flu

Cryptogon, 26 February 2009
https://www.cryptogon.com/?p=7187

That's the headline, but the reality of what happened might indicate a far more serious situation.

In U.S. Researchers Trying to Create Pandemic Avian Flu, pay very close attention to the part about the ferrets:

> Nabel believes what they have found thus far is just a subset of the changes the virus will need to make in order to cause a pandemic - so their search continues. And as they identify promising mutations, the team plans to make these changes to the real H5N1 virus.
>
> This is where ferrets enter the picture, or rather, they will enter a Biosafety Level 4 containment facility (the highest level of security), where they will be infected with the altered H5N1 virus. If the ferrets start sneezing, and if healthy ferrets in the next cage get sick, then the virus has become more transmissible. Vaccines based on these altered viruses will then be made. "We wouldn't make millions of doses but we could make small stockpiles;' says Nabel.
>
> [Now that Gary Nabel, Director of the Vaccine Research Center at the National Institute of Allergy and Infectious Diseases, admits that his team is trying to engineer a pandemic strain of the H5N1 virus]

Now, flash forward to today.

What happened to the ferrets that received Baxter's H5N1 virus material?

The animals died "promptly" according to the story below.

The sixty-four-thousand-dollar question is: Did any ferrets in neighboring cages – that didn't receive the Baxter H5N1 virus – also get sick and die? The answer to that question is conveniently missing from every story that I have found about this incident.

If the answer is 'yes' it means that Baxter didn't supply standard H5N1 virus, but rather a weaponized/pandemic version that is the same as or similar to the one that the National Institute of Allergy and Infectious Diseases was developing.

Effect Measure

Questions about bird flu contaminated vaccine – or something

Effect Measure, 26 February 2009
https://web.archive.org/web/20090228193303/http://scienceblogs.com/effectmeasure/2009/02/questions_about_bird_flu_conta.php

As I write this story it is still hazy ...

This time it's a vaccine maker and the cock-up sounds pretty horrendous, although it is hard to figure out exactly what has happened given the incomplete descriptions and lack of information from the parties involved:

Baxter International Inc. in Austria unintentionally contaminated samples with the bird flu virus that were used in laboratories in three neighboring countries, raising concern about the potential spread of the deadly disease.

The contamination was discovered when ferrets at a laboratory in the Czech Republic died after being inoculated with vaccine made from the samples early this month. The material came from Deerfield, Illinois-based Baxter, which reported the incident to the Austrian Ministry of Health, Sigrid Rosenberger, a ministry spokeswoman, said today in a telephone interview.

"This was infected with a bird flu virus," Rosenberger said. "There were some people from the company who handled it."

The material was intended for use in laboratories, and none of the lab workers have fallen ill. The incident is drawing scrutiny over the safety of research using the H5N1 bird flu strain that's killed more than three-fifths of the people known to have caught the bug worldwide. Some scientists say the 1977 Russian flu, the most recent global outbreak, began when a virus escaped from a laboratory.

The virus material was supposed to contain a seasonal flu virus and was contaminated after "human error," said Christopher Bona, a spokesman for Baxter, in a telephone interview. (Michelle Fay Cortez and Jason Gale, Bloomberg)

On first reading this took my breath away because it sounded like a seasonal flu vaccine had become contaminated with H5N1. On second (and third) reading I am not sure what actually *did* happen and to whom. Here's what I am unsure about:

- What was contaminated? The Bloomberg story refers to "samples," but samples of what?
- Ferrets succumbed after failing ill after being "inoculated" with vaccine made from the samples. Does this mean it was a live virus vaccine? (inoculation usually means something living; if it were a vaccine without live materials you would ordinarily say "vaccinated" but people don't always use words precisely).
- The contaminated material was "for use in laboratories." What does this mean? It was raw material in a lab that was then made into something else for use outside the lab (like a vaccine)?
- The contaminated material was supposed to have seasonal flu virus in it, not bird flu virus. It sounds like it had both. ("The company was "supposed to get non-infected testing vaccine, which was by mistake of the supplier contaminated with the H5N1 virus"). That's a recipe for reassortment between a human and a bird virus. Not the dish I'd like to see served up.
- Did this happen with a vaccine in clinical trials?
- We are told that no lab worker has fallen ill. How were they exposed?
- Labs have been "sanitized." What exactly does this mean? How was the lab contaminated?

Maybe this isn't the mess it sounds like. It would be nice to have more information from European health authorities. US CDC is apparently not playing any role, which suggests no US seasonal vaccines are involved. But the source of the contaminated sample was a US company, so inquiry from some US authorities seems appropriate.

That's not happening as far as we are told. Why not? Lots of questions. Few answers.

Osterode am Harz (ots)

Die analytische und kritische Berichterstattung von LifeGen.de kommt bei den globalen Nutzern an: Über 22.000 Unique User besuchten allein im Februar die Site (Stand 27.2.2009), ein Monat zuvor waren es noch rund 10.000 gewesen. Auch das Alexa-Ranking zeigt weiter nach oben: Global stehen wir nun auf Platz 217.926, in den USA avancierten wir auf Rang 837.055 nach 1,4 Mio. noch vor zwei Wochen. "Der Ansturm stellt uns vor neue Herausforderungen", kommentiert CEO Vlad Georgescu den Trend, und: "Wir suchen intensiv nach Investoren und Teilhabern, denen eine solide, unabhängige und analytische Berichterstattung wichtiger ist als die schnelle Rendite". Die in Fachkreisen als Viren-Tschernobyl bezeichnete Labor-Kontamination mit pathogenen Vogelgrippe-Viren der Stämme H5N1 und H3N2 durch den Pharmakonzern Baxter in gleich vier Ländern der EU zeige die Notwendigkeit eines Watch-Dienstes wie LifeGen.de: "Die großen Medien hierzulande haben den Fall praktisch verschlafen - Deutschland ist aber davon betroffen", erklärt Georgescu. Die Berichterstattung von LifeGen.de habe indes auch der Newsservice GOOGLE FINANCE in den USA aufgegriffen - was schon am gestrigen Donnerstag anhand des Baxter-Aktiencharts deutlich zu erkennen war.

Tatsächlich setzt LifeGen.de im Vergleich zu vielen anderen Medien seit Jahren auf ein eigenes Konzept: Unliebsame Entwicklungen werden rechtzeitig und direkt aufgezeigt, gleichzeitig Alternativen führender Wissenschaftsinstitute und Organisationen beleuchtet. "Da eine Abhängigkeit zu Werbeetats nicht besteht und auch sonst keine verdeckten Finanzierer die Site stützen, können wir uns einen harten, investigativen Journalismus leisten", erklärt Marita Vollborn, Chefredakteurin des Magazins.

Als Wunschpartner oder Einstiegskandidaten bei LifeGen.de wünsche man sich technologisch starke und fiananziell unabhängige Unternehmen wie Google, Microsoft, oder die Bill and Melinda Gates Stiftung, heißt es weiter aus Osterode am Harz. "Google in Mountain View und LifeGen.de in den Harz Mountains ließe sich wunderbar vermarkten", scherzt Georgescu, und fügt hinzu: "Aber im Grunde sehen wir genau in solchen Konstellationen eine Chance auf journalistische Sites der Zukunft die, so wie wir, Katastrophen á la Finanzkrise und Jobabbau schon vor Jahren vorhersagten". Zwar habe man intern überlegt, das Portal für fünf Millionen USD zu verkaufen, um mit dem Geld neue Projekte anzugehen, heißt es dazu aus Osterode. Doch die enorme globale Nachfrage und Akzeptanz ließen diesen Schritt derzeit als nicht mehr sinnvoll erscheinen. "Wir wollen uns vergrößern, und es gibt viel zu tun", sagt Vollborn.

Zu den aktuellen Nutzern von Lifegen.de gehören Bundesbehörden, Regierungen, US-amerikanische Sicherheitsinstitutionen und zahlreiche Konzerne, Unternehmen und Universitäten weltweit. Politik und Medien zählen ebenfalls zu den regelmäßigen Lesern des special interest Dienstes.

Baxter's H5N1 as global flu pandemic threat

(Editorial)

LifeGen.de, 27 Februiary 2009
https://web.archive.org/web/20090308012022/http://www.lifegen.de/newsip/shownews.php4?getnews=2009-02-26-5323&pc=s01

There is no excuse. According to the scientific network PROMED, Baxter International Inc. in Austria "unintentionally contaminated samples with the bird flu virus that were used in laboratories in 3 neighbouring countries, raising concern about the potential spread of the deadly disease". Austria, Germany, Slowenia and the Czech Republic - these are the countries in which labs were hit with dangerous viruses. Not by bioterrorist commandos, but by Baxter. In other words: One of the major global pharmaceutical players seems to have lost control over a virus which is considered by many virologists to be one of the components leading some day to a new pandemic. Was it H5N1, or the even more risky H3N2? And what about the BSL3-Standards Baxter is operating when handling the viruses? What happened? And who failed? *by Vlad Georgescu*

These questions have to be answered not only by Baxter itself. It looks difficult to believe that viral and potentially lethal samples can cross the US border, pass the Atlantic, arrive the European Union and get into three countries without any or adequate control. While every tourist has to present his fingerprints and electronic registered passports entering the United States, institutions like the US Homeland Security should stay alert: Lacks in pharmaceutical companies may be the deadly door to future bioterrorist attacks.

The anthrax mailings from 2001 still are in mind of the FBI – Baxter shows that 8 years after that disaster there is no efficient control, at no level. To pronounce it this way is legitimated by the facts. H5N1 never should get on unknown travel routes with unwanted destinations. And H3N2 is no "sorry, it's an error" substance. It can be deadly for birds and humans, as virologists know.

The subprime crisis and the fate of many broken banks are an example for poor regulations. For the financial markets, for the entire economy this may have resulted in global recession. meanwhile, failure of control and regulations for labs operating with viruses like H5N1 will have another outcome: the risk of a new global pandemic, bioterrorist attacks or millions of deaths. This is the only message, and lesson, for President Barack Obama and his team: Get things in biohazard labs under control – at home.

Effect Measure

Baxter bird flu botch

Effect Measure, 28 February 2009;
https://web.archive.org/web/20090303193444/http://scienceblogs.com/effectmeasure/2009/02/baxter_bird_flu_botch.php

In a post the other day on some kind of flu vaccine mishap in Austria we called it a colossal screw-up. It turns out we may have understated the case. Maybe. Because while more details are leaking out, the company responsible for it, Baxter International, isn't saying exactly what happened on the grounds that it is confidential business information. You almost have to admire that kind of arrogance. Almost. Meanwhile Helen Branswell brings us more details:

The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses.

And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany. (Helen Branswell, Canadian Press, via The Sun)

One of the big fears is that people or animals co-infected with a seasonal flu virus of humans and a virulent avian flu virus like H5N1 will act as a mixing vessel. Flu viruses each have eight genetic packages within them and when co-infecting a cell they can mix and match (reassortment), thus producing new hybrid bird-human viruses. Baxter put both viruses in the same vial, presumably for use as a vaccine. Baxter is calling the mixture an "experimental virus material," whatever that is. All we know is that a nasty live virus cocktail of human and bird influenza virus was made (Baxter says accidentally). Exactly to whom it was given, if anyone, is not being publicly divulged. We have a news report from an Austrian paper dated February 11, a Wednesday, that tells of 19 people being seen as outpatients at a Vienna hospital the previous Monday (February 9) because of exposure to "bird flu virus." The article said no one was sick, there was no evidence of infection, and the females were prophylaxed with antivirals (presumably Tamiflu).

WHO's European regional office in Copenhagen is saying they are confident there is no public or occupational health risk "at present," but they also acknowledge they don't know exactly what happened. They also say they do not any evidence that any reassortment occurred. I'm not sure exactly what evidence they looked at or have available, so I don't know how to interpret this absence of evidence. I'm certainly not reassured that unlabeled live H5N1 virus was released, even if just to another lab. There are people and animals in laboratories that were exposed and could have resulted in the virus getting into the general community in a major city with many international links.

Baxter's not saying much. Branswell quotes a company spokesperson as saying the incident happened through a combination of "just the process itself, (and) technical and human error in this procedure." This doesn't sound very reassuring, either, because it sounds like there is a process that is error prone ("technical" and human). If Baxter's name sounds familiar it may be because almost exactly a year ago they were in the news over a series of fatal allergic reactions among dialysis patients who used the blood thinner heparin they manufactured. It turned out their heparin came from China and contained an adulterant, oversulfated chondroitin sulfate. Patients in six countries and over a dozen states in the US had serious adverse reactions and more than 80 deaths. At the time, Baxter said on their website that they "will not sell another vial of heparin until the company has helped to create a system in which the quality and safety of heparin is secured." (Medpage Today)

They weren't saying anything about the safety of their bird flu products, then. And not much now, either.

Live Avian Flu Virus Contained in Vaccine

The Sun Times (Canada), 28 Feb 2009, Sat, p. A10
https://www.newspapers.com/image/726344004/

The company that released con laminated flu virus material from a plant in Austria confirmed Friday that the experimental product con-tamed five H5NI avian flu viruses. And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Ort ft Donau. Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

CIDRAP

Baxter samples combined live H5N1 with H3N2

News Scan: Avian flu, tainted Baxter samples,
HHS secretary nomination, H5N1 vaccines, polio warning

CIDAR, 2 March 2009
https://www.cidrap.umn.edu/avian-influenza-bird-flu/news-scan-avian-flu-tainted-baxter-samples-hhs-secretary-nomination-h5n1

The H5N1-contaminated virus samples that were sent from a Baxter facility in Orth-Donau, Austria, contained a live version of the H5N1 avian influenza virus mixed with human H3N2 seasonal influenza virus, according to a Feb 27 report from the Canadian Press (CP) that cited an official from Baxter. The company said it supplied the "experimental virus material" to an Austrian research company, which then shipped it to subcontractors in the Czech Republic, Germany, and Slovenia, the CP report said. A WHO official in Europe told the CP that authorities are trying to determine what went wrong at Baxter's facility and that the public health risks from the incident are currently minimal.

Baxter H5N1 Contamination:
Causes were a unique combination of process, technical and human errors

LifeGen.de, 3 March 2009
https://web.archive.org/web/20091114231656/http://www.lifegen.de/newsip/shownews.php4?getnews=2009-03-02-2412&pc=s02

Since we started our coverage of the Baxter-Contamination Story in Europe shares of the big pharmaceutical company in Deerfield, IL have lost more more than 8 percent in two days, as a look at Google Finance reveals. Baxter's Chief of Communications in the US, Christopher Bona, supported our idea for an exclusive interview, so Jutta Brenn-Vogt, Manager Communications at Baxter Deutschland GmbH explained LifeGen.de what really happened with H5N1, and how security measures - not only at Baxter - should work on a global scale.

LifeGen.de: How and when did Baxter find out about the contamination?

Brenn-Vogt: A suspicion concerning a potential contamination arose at AVIR Greenhills' contracted lab in the Czech Republic during the late afternoon of Friday, February 6. Baxter was then notified by AVIR Greenhills about this situation in three locations (Slovenia, Czech Republic, Austria) during the early evening of Friday, February 6. The last notification was on February 17 from AVIR Greenhills regarding a laboratory in Germany.

LifeGen.de: Promed mentions H5N1 and/or H3N2 as contaminants. Could you describe us what exactly happened to the charges?

Brenn-Vogt: Firstly, the material that was contaminated with H5N1 was not a vaccine, but was an experimental virus material. The impacted material was made at Baxter's facility in Orth, Austria. It was produced exclusively for laboratory testing for AVIR Greenhills. It was not used for product production or for use in humans.

The root cause of the incident has been identified. It was due to a unique combination of process, technical and human error in a procedure used for this specific research project in our facility in Austria (Orth). The chances of such a confluence of events repeating itself are virtually impossible. Cross-contamination of commercial product, clinical material or other experimental material has been absolutely excluded. The public health authorities in Austria performed an audit at Baxter's research facility in Austria and Baxter's corrective and preventative actions were found appropriate by the auditors. The contamination occurred only during the process for this specific research project for AVIR Greenhills in Baxter's facility.

The employees who may have been exposed to this material have gone through a specific examination by infectious disease specialists. These people were tested or considered by disease specialists not to be at risk. The results of all performed tests were negative.

LifeGen.de: Baxter is handling H5N1 in BSL3 labs. Where is the security lack of the system? In other words: How could the charges get in European 4 countries without intention?

Brenn-Vogt: As this material was not produced for human use, testing for potential contamination is not routinely carried out. Baxter sent this material to AVIR Greenhills in Austria, they, in turn, reported to us later that they sent it to four labs with whom they contract. As explained above, this was not the result of a lack of security but it was due to a unique combination of process, technical and human error in a procedure used for this specific research project.

LifeGen.de: Do you think smaller companies like Avir Green Hills Biotechnology should handle Baxter's charges?

Brenn-Vogt: Baxter is contracted to provide influenza virus material to AVIR Greenhills for that company's use in developing their influenza vaccine. In this case, Baxter produced one component of the influenza vaccine. The individuals working with the experimental material were operating in laboratory containment conditions specifically designed to prevent exposure. We see no need to speculate on how the size of a lab had bearing on this incident.

LifeGen.de: After the Antrhrax mailings in 2001, which is no Baxter related case, but not less risky, this is the second virological contamination starting directly from the US. How will Baxter prevent future accidents like the one in Europe for the future?

Brenn-Vogt: Exposure was highly unlikely -- the individuals working with the experimental material were operating in laboratory containment conditions specifically designed to prevent exposure. All H5N1 infections that have been reported to date have been associated with direct exposure to infected poultry/birds.

As mentioned above, this incident originated in Austria, not the US. The circumstances of the contamination were a unique combination of process, technical and human errors. Cross-contamination of commercial product, clinical material or other experimental material has been absolutely excluded. The public health authorities in Austria performed an audit at Baxter’s research facility in Austria (Feb. 16) and Baxter’s corrective and preventative actions were found appropriate by the auditors. The contamination occurred only during the process for this specific research project for AVIR Greenhills in Baxter’s facility. Further details about the process will not be discussed as it is proprietary information.

LifeGen.de: Will the contamination in Europe lead to management changes in your company?

Brenn-Vogt: No.

LifeGen.de

Viral Pandemic H5N1 flu threat: Baxter contaminates European labs by error

LifeGen.de, 3 March 2009;
https://web.archive.org/web/20090320230546/http://www.lifegen.de/newsip/shownews.php4?getnews=2009-02-25-5123&pc=s02

It could be a Hollywood Worst Case Thriller, but it is real: According to the scientific network PROMED, Baxter International Inc. in Austria "unintentionally contaminated samples with the bird flu virus that were used in laboratories in 3 neighboring countries, raising concern about the potential spread of the deadly disease". As PROMED reports, the contamination has been discovered when ferrets at a laboratory in the Czech Republic died after being inoculated with vaccine made from the samples early this month. "The material came from Deerfield, Illinois-based Baxter, which reported the incident to the Austrian Ministry of Health, Sigrid Rosenberger, a ministry spokeswoman, said today in a telephone interview", the network-alert-system is quoting. "This was infected with a bird flu virus," Rosenberger said. "There were some people from the company who handled it." There are severe signs that the long expected pandemic avian influenza could be on its way to conquer the world - even without Baxter's error driven help. *by Vlad Dan Georgescu and Marita Vollborn*

First deaths in Asia concern little children, which from virological point of view is a rather new aspect, and could be the evidence for a new spread. While scientists expect this pandemic to happen in the near future, the new President should also stay alert: A coming influenza pandemic would deteriorate the global economy even without financial crisis, recession - or Baxter.

Evidence for the global threat comes from China, where a 2 year old girl has been confirmed to be infected with bird flu in the northern Shanxi Province, as government officials said last Saturday. The child was found ill on 7th of January in the central Hunan province - the little patient still is in critical condition. According to the test result of the Chinese Center for Disease Control and Prevention, the girl had been tested positive for the H5N1 strain of avian influenza.

On the other site of the globe, the Ministry of Health and Population of Egypt announced a new human case of avian influenza A(H5N1) virus infection last week, the case being a 21 month old girl Kerdasa District.

“Infection with the H5N1 avian influenza virus was diagnosed by PCR at the Egyptian Central Public Health Laboratory and subsequently confirmed by the U. S. Naval Medical Research Unit No. 3 (NAMRU-3) laboratories”, reports the special wire PROMED. According to PROMED, investigations into the source of her infection indicate a recent history of contact with sick and dead poultry - 23 similar cases in Egypt have been fatal up to date.

Old Europe as leading research power?

Given such facts, Mr. Obama should follow European research policy: European research on vaccine development for pandemic influenza has been financed since 2001 by the European Union. Early projects worked to develop an egg-free vaccine, which is faster and safer to produce, along with innovative application techniques. Research is now underway with the objectives of fighting the disease at the source (infected birds) and protecting human populations through pandemic

influenza vaccines. Future EU research will improve vaccine efficiency by adding adjuvants, substances that boost the body's immune response to vaccine antigen. Additionally, research teams are currently focused on developing a universal flu vaccine that could provide a lifetime of protection from influenza.

Latest surveillance data coming through the European Centre for Disease Prevention and Control (ECDC) from virologists and clinicians indicates that the influenza A(H3N2) virus is the predominant strain in Europe so far this season (2008/2009). Based on the data published by ECDC the pharmaceutical company Roche confirms that the oral antiviral Tamiflu (oseltamivir) is fully active against influenza A(H3N2) and influenza B, which currently comprise 94 percent of circulating viruses in Europe this year. Tamiflu resistance reported in the 2008-2009 influenza seasons is confined to H1N1. No resistance has been seen with other circulating seasonal viruses - H3N2 and influenza B.

"Recent media reporting has elevated awareness of the H1N1 seasonal resistance seen this year in the United States and the Far East. However, in Europe the picture is different with H3N2 being the dominant strain so far. The circulating H3N2 viruses, which often cause a more severe illness than H1N1, are sensitive to oseltamivir, which means that oseltamivir will be active against the vast majority of influenza infections in Europe this season, if current trends continue," comments Prof Albert Osterhaus, Head of Virology, Erasmus Medical Centre, Rotterdam. "It is important that doctors understand that oseltamivir remains an effective treatment for patients across Europe."

Flu alert for the new President

However, the situation in the United States is more alerting, according to the Centers for Disease Control and Prevention (CDC). A new University of Colorado at Boulder study showed the resistance of the avian flu virus to a major class of antiviral drugs "is increasing through positive evolutionary selection, with researchers documenting the trend in more than 30 percent of the samples tested", as the scientists report. Even if the expected influenza pandemic did not start yet, there is no doubt about the comeback of the lethal virus: The first Pandemic Influenza occurred in three waves in the United States - exactly 90 years ago, between 1918 and 1919.

Vaccines as Biological Weapons?
Live Avian Flu Virus Placed in Baxter Vaccine Materials Sent to 18 Countries

Natural News, 3 March 2009
https://web.archive.org/web/20090304191735/http://www.naturalnews.com/025760.html

There's a popular medical thriller novel in which a global pandemic is intentionally set off by an evil plot designed to reduce the human population. In the book, a nefarious drug company inserts live avian flu viruses into vaccine materials that are distributed to countries around the world to be injected into patients as "flu shots." Those patients then become carriers for these highly-virulent strains of avian flu which go on to infect the world population and cause widespread death.

There's only one problem with this story: **It's not fiction.** Or, at least, the part about live avian flu viruses being inserted into vaccine materials isn't fiction. It's happening right now.

Deerfield, Illinois-based pharmaceutical company **Baxter International Inc.** has just been caught shipping *live avian flu viruses* mixed with vaccine material to medical distributors in **18 countries**. The "mistake" (if you can call it that, see below...) was discovered by the National Microbiology Laboratory in Canada. The World Health Organization was alerted and panic spread throughout the vaccine community as health experts asked the obvious question: How could this have happened?

As published on LifeGen.de (http://www.lifegen.de/newsip/showne...), serious questions like this are being raised:

> *"Baxter International Inc. in Austria 'unintentionally contaminated samples with the bird flu virus that were used in laboratories in 3 neighbouring countries, raising concern about the potential spread of the deadly disease'. Austria, Germany, Slowenia and the Czech Republic - these are the countries in which labs were hit with dangerous viruses. Not by bioterrorist commandos, but by Baxter. In other words: One of the major global pharmaceutical players seems to have lost control over a virus which is considered by many virologists to be one of the components leading some day to a new pandemic."*

Or, put another way, **Baxter is acting a whole lot like a biological terrorism organization these days**, sending deadly viral samples around the world. If you mail an envelope full of anthrax to your Senator, you get arrested as a terrorist. So why is Baxter -- which mailed samples of a far more deadly viral strain to labs around the world -- getting away with saying, essentially, "Oops?"

But there's a bigger question in all this: How could this company have *accidentally* mixed LIVE avian flu viruses (both H5N1 and H3N2, the human form) in this vaccine material?

Was the viral contamination intentional?

The shocking answer is that *this couldn't have been an accident*. Why? Because Baxter International adheres to something called **BSL3** (Biosafety Level 3) - a set of laboratory safety protocols that prevent the cross-contamination of materials.

As explained on Wikipedia (http://en.wikipedia.org/wiki/Biosaf...):

"Laboratory personnel have specific training in handling pathogenic and potentially lethal agents, and are supervised by competent scientists who are experienced in working with these agents. This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features."

Rakouská ptačí chřipka šla do Česka i Německa

iDNEZ.cz, 4. března 2009, 4:54
https://www.idnes.cz/zpravy/domaci/rakouska-ptaci-chripka-sla-do-ceska-i-nemecka.A090303_214331_domaci_abr

Smrtící virus ptačí chřipky se nekontrolovaně ocitl najednou na několika místech v Evropě. Podle zjištění MF DNES testovali lidé z rakouské pobočky mezinárodní farmaceutické společnosti Baxter "kontaminovanou vakcínu" nejen v české laboratoři v Konárovicích na Kolínsku, ale i ve dvou sousedních zemích.

"Vakcína nakažená ptačí chřipkou se testovala v samotném Rakousku, České republice, Německu a ve Slovinsku. A všude se tento problém vyskytl," říká hlavní hygienik a náměstek ministryně zdravotnictví Michael Vít.

V žádné z laboratoří o tom neměli ani tušení. Poslední lednový den poslali farmaceuti z Rakouska nedopatřením do čtyř laboratoří na výzkum virus, který je pro svoji nebezpečnost zapsán do seznamu možných biologických zbraní. - čtěte Do Česka se dostala vakcína nakažená smrtelným virem ptačí chřipky

Teď už českou laboratoř stíhá první instituce – Státní úřad pro jadernou bezpečnost.

Úřad, který má na starosti biologickou bezpečnost, totiž nikdo z rakouské ani české strany neinformoval. Sama farmaceutická společnost Baxter se o nakažené zásilce dozvěděla až o šest dní později, kdy se fretky, na kterých se látka testovala, začaly chovat nenormálně.

"Máme za to, že došlo k porušení oznamovací povinnosti. Přitom virus ptačí chřipky H5N1 patří na seznam nebezpečných látek," míní Dana Drábová, předsedkyně Státního úřadu pro jadernou bezpečnost.

S konárovickou firmou Biotest, která kontaminovanou zásilku testovala, proto v nejbližších dnech zahájí správní řízení. "Jestli se vina prokáže, hrozí pokuta, která může v extrémním případě dosáhnout až pěti milionů korun," dodává Drábová.

Už týdny jsou kvůli nakažené zásilce na nohou hygienici, veterináři i státní ústav pro kontrolu léčiv. V rakouské pobočce začali pracovat také kontroloři Evropské agentury pro léčivé přípravky.

I když se společnost dušuje, že nic podobného se stát už nemůže, lze očekávat další sankce. "Případ ještě není uzavřen," upozorňuje Josef Duben ze Státní veterinární správy.

"Už to nikdy neuděláme"

Společnost Baxter však vyvrací, že by šlo o testování chřipkové vakcíny pro lidi. "Naše firma poslala do české společnosti Biotest na výzkum čistý virus běžné chřipky a záměnou se stalo, že poslala virus ptačí chřipky. Šlo o záměnu testovacího materiálu," říká zástupce rakouské pobočky společnosti Baxter Richard Tischler.

Podle něj bylo riziko, že se ptačí chřipka dostane z laboratoří ven, velmi nízké. "Postup, který byl použit k výrobě výzkumného materiálu, se už nikdy opakovat nebude," podotýká Tischler.

Všechny čtyři testovací laboratoře byly vyčištěny, pracovníci, kteří s virem pracovali, dostali lék tamiflu a jsou nadále pod lékařským dohledem. "Žádný z českých pracovníků nakažený nebyl," říká Vít.

ČESKÉ noviny.cz
ZPRAVODAJSKÝ SERVER ČTK

Kontaminovaná vakcína se testovala nejen v ČR

České Noviny, 4 March 2009

https://web.archive.org/web/20100118072654/http://www.ceskenoviny.cz/zpravy/kontaminovana-vakcina-se-testovala-nejen-v-cr/363674

Praha - Testovací materiál, který zkoumala společnost BioTest a který byl kontaminován virem ptačí chřipky H5N1, údajně testovali lidé z rakouské pobočky farmaceutické firmy Baxter nejen v Česku, ale i v jiných evropských zemích. Uvádí to dnešní Mladá fronta Dnes (MfD). Již dříve napsala, že virus H5N1 nedopatřením obsahoval výzkumný materiál firmy Baxter, kterou BioTest testoval v Konárovicích na Kolínsku.

"Vakcína nakažená ptačí chřipkou se testovala v samotném Rakousku, České republice, Německu a ve Slovinsku. A všude se tento problém vyskytl," řekl MfD hlavní hygienik ČR Michael Vít. V žádné z laboratoří o tom podle deníku neměli tušení.

Zástupce firmy Baxter Richard Tischler v prohlášení pro ČTK zdůraznil, že materiál byl vyroben výhradně pro výzkum, nikoli pro výrobu produktů nebo pro jakékoli použití u lidí. Testovací látku podle Tischlera neposílala do BioTestu ale firma Baxter, nýbrž rakouská společnost AVIR Greenhills, která si laboratoř BioTestu najala.

"Ke kontaminaci došlo jen během procesu pro tento konkrétní výzkumný projekt pro AVIR Greenhills v laboratoři firmy Baxter. A tento konkrétní proces se již nebude opakovat," uvedl Tischler s tím, že rakouské orgány pro ochranu veřejného zdraví vyhodnotili nápravná a preventivní opatření firmy Baxter jako odpovídající.

Lidé podle Tischlera pracovali s experimentálním materiálem v izolovaných laboratorních podmínkách. Také zástupci firmy BioTest před časem ČTK sdělili, že "projekt standardně probíhal v zabezpečených laboratorních prostorách s použitím příslušných ochranných pomůcek pracovníků a za standardního dodržení bezpečnostních podmínek". Při tomto výzkumu nebyl nikdo z jejích pracovníků nakažen.

Podle MfD farmaceuti z Rakouska poslali koncem ledna nedopatřením do čtyř laboratoří na výzkum virus, který je pro svou nebezpečnost zaznamenán do seznamu možných biologických zbraní. "Máme za to, že došlo k porušení oznamovací povinnosti. Přitom virus ptačí chřipky H5N1 patří na seznam nebezpečných látek," řekla MfD předsedkyně Státního úřadu pro jadernou bezpečnost Dana Drábová. S firmou Biotest proto v nejbližších dnech podle MfD zahájí správní řízení.

"Jestli se vina prokáže, hrozí pokuta, která může v extrémním případě dosáhnout až pěti milionů korun," uvedla Drábová.

V rakouské pobočce začali podle MfD pracovat kontroloři Evropské agentury pro léčivé přípravky.

WORLD HEALTH .NET

Gary Clark

Experimental virus material contained live bird flu virus, flu vaccine maker confirms

World Health.Net, 4 March 2009, 9 a.m.
https://worldhealth.net/news/experimental_virus_material_contained_li/

Baxter International released a contaminated “experimental virus material” from a plant in Austria, which was based on a human flu strain, but contaminated with live H5N1 avian flu virus, then distributed it to an Austrian research firm. While the combination can have dire consequences, there has been no evidence to date of any public health issues.

Baxter International, a major manufacturer of flu vaccines, admitted this past week that it released a contaminated product containing a combination of H3N2 seasonal flu viruses and unlabelled H5N1 viruses from a plant in Austria. Portions of that product were supplied to the Austrian research firm, Avir Green Hills Biotechnology. Avir then sent portions of it to its subcontractors in the Czech Republic, Slovenia and Germany. When the firm in the Czech Republic inoculated ferrets with the product, they died, alerting scientists to the possibility that the product contained live H5N1 avian flu virus. Baxter's Director of Global Bioscience Communications Christopher Bona confirmed in an email that it was live. The incident is being described as a "serious error" on the part of Baxter, which is trying to secure a European license for an H5N1 vaccine.

The fact that human H3N2 and avian H5N1 viruses co-mingled causes great concern to public health experts, which describe the co-mingling as a "dangerous practice that should not be allowed to happen." In fact, the release of the virus combination could have had dire consequences. Although H5N1 doesn't easily infect humans, H3N2 viruses do. Should a person be vaccinated with a mixture of the H5N1 and H3N2 viruses, that individual could "serve as an incubator for a hybrid virus able to transmit easily to and among people," say experts. And that process, called re-assortment, can result in the creation of a pandemic virus.

Fortunately, it appears that none of the 36 or 37 people exposed to the contaminated product became infected. Says Medical Officer Roberta Andraghetti from Copenhagen, Denmark, "At this juncture we are confident in saying that public health and occupational risk is minimal at present. We have no evidence of any reassortment having occurred. And we have no evidence of any increased transmissibility of the viruses that were involved in the experiment with the ferrets in the Czech Republic." To date, Baxter has not publicly released information on how the incident occurred. Christopher Bona said that concerns about revealing proprietary information about Baxter's production process precludes the company from making additional information available to the general public.

The incident is under investigation by the four European countries involved. Those investigating governments are working in close collaboration with the WHO and the European Centre for Disease Control in Stockholm, Sweden. Says Andraghetti, "We are in very close contact with Austrian authorities to understand what the circumstances of the incident in their laboratory were. And the reason for us wishing to know what has happened is to prevent similar events in the future and to share lessons that can be learned from this event with others."

911 Blogger.com

An American pharma Baxter vaccine against flu found contaminated by H5N1 virus in several European countries.

911 Blogger.com, 4 March 2009, 10:03
https://web.archive.org/web/20100602183012/http://www.911blogger.com/node/19517

The Czech company Biotest near from Prague got from Austria a testing batch of the new flu vaccine for 2009 from the american company Baxter. In february they have found that the vaccine was contaminated by the H5N1 - Avian flu virus, which is on the list of the possible biological weapons and is one of the most dangerous biological agents on the Earth - with more than 60% death rate. All the testing animals in Biotest were subsequently destroyed and all the workers in the company were put in quarantine. Luckily nobody contracted the disease. Subsequently the same problem of the Baxter vaccines contamination with H5N1 was found in the laboratories in Slovenia, Austria and Germany, which confirms that the source of the contagion was in fact the Baxter vaccine, which could be very probable, because Baxter is one of the companies, which are developing the vaccines against H5N1.

First the company Baxter was evoking the 'trade secret" and refused to comment how the H5N1 virus got into the vaccines, but then, when it was already clear that the source of the contagion is in fact the Baxter vaccine, their representative then confirmed, that the contaminated vaccine was produced by Baxter laboratories for the company AVIR Greenhills and distributed by Austrian company Ortha. And on the end he even said that the material sent to the Czech republic, Austria, Slovenia and Germany was in fact a pure H5N1 sent by accident - maybe to mask the previous assumption, that it was in fact an ordinary flu vaccine, which was contaminated. If it was in fact the pure H5N1 or contaminated vaccine is still not clear.

Already weeks all the sanitation officials kick around in all the countries where the contaminated vaccine was found. Czech authorities now will hopefully proceed with the prosecution against all companies involved and of course the suit for criminal negligence and public menace against Baxter is still on the table.

But was this just a criminal negligence or it was an attempt to provoke pandemia using vaccination against flu to spread the disease - as happened with the anti-B hepatitis vaccination with vaccines containing the HIV virus in US? - and then cash for the vaccines against H5N1 which Baxter develops? How could on Earth a virus as H5N1 come to the ordinary flu vaccines? Don't they follow even basic precautions in the american pharma companies? - As they didn't in this case here and even after they learned their medicals are contaminated with HIV, they sold them to Europe and East. Am I just a paranoid or is David Rivera right?

NewScientist

Bird flu mix-up could have spelled disaster

New Scientist, 4 March 2009
https://web.archive.org/web/20160413045834/https://www.newscientist.com/article/mg20126983-400-bird-flu-mix-up-could-have-spelled-disaster/

IT'S emerged that virulent H5N1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the H5N1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, unexpectedly, ferrets inoculated with the sample had died. It turned out the sample contained live H5N1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen."

INFORMAČNÍ CENTRUM BEZPEČNOSTI POTRAVIN
BEZPEČNOST POTRAVIN

Rakouská ptačí chřipka šla do Česka, Německa a Slovinska

Bezpecnosti potravin, 4 March 2009
https://bezpecnostpotravin.cz/rakouska-ptaci-chripka-sla-do-ceska-nemecka-a-slovinska/

Podle serveru iDNES.cz rakouská pobočka firmy Baxter testovala “kontaminovanou vakcínu” nejen v Česku.

Smrtící virus ptačí chřipky se nekontrolovaně ocitl najednou na několika místech v Evropě. Podle zjištění MF DNES testovali lidé z rakouské pobočky mezinárodní farmaceutické společnosti Baxter "kontaminovanou vakcínu" nejen v české laboratoři v Konárovicích na Kolínsku, ale i ve dvou sousedních zemích.

"Vakcína nakažená ptačí chřipkou se testovala v samotném Rakousku, České republice, Německu a ve Slovinsku. A všude se tento problém vyskytl," říká hlavní hygienik a náměstek ministryně zdravotnictví Michael Vít.

V žádné z laboratoří o tom neměli ani tušení. Poslední lednový den poslali farmaceuti z Rakouska nedopatřením do čtyř laboratoří na výzkum virus, který je pro svoji nebezpečnost zapsán do seznamu možných biologických zbraní (čtěte Do Česka se dostala vakcína nakažená smrtelným virem ptačí chřipky).

Teď už českou laboratoř stíhá první instituce – Státní úřad pro jadernou bezpečnost.

Úřad, který má na starosti biologickou bezpečnost, totiž nikdo z rakouské ani české strany neinformoval. Sama farmaceutická společnost Baxter se o nakažené zásilce dozvěděla až o šest dní později, kdy se fretky, na kterých se látka testovala, začaly chovat nenormálně.

"Máme za to, že došlo k porušení oznamovací povinnosti. Přitom virus ptačí chřipky H5N1 patří na seznam nebezpečných látek," míní Dana Drábová, předsedkyně Státního úřadu pro jadernou bezpečnost.

S konárovickou firmou Biotest, která kontaminovanou zásilku testovala, proto v nejbližších dnech zahájí správní řízení. "Jestli se vina prokáže, hrozí pokuta, která může v extrémním případě dosáhnout až pěti milionů korun," dodává Drábová.

Už týdny jsou kvůli nakažené zásilce na nohou hygienici, veterináři i Státní ústav pro kontrolu léčiv. V rakouské pobočce začali pracovat také kontroloři Evropské agentury pro léčivé přípravky.

I když se společnost dušuje, že nic podobného se stát už nemůže, lze očekávat další sankce. "Případ ještě není uzavřen," upozorňuje Josef Duben ze Státní veterinární správy.

"Už to nikdy neuděláme"

Společnost Baxter však vyvrací, že by šlo o testování chřipkové vakcíny pro lidi. "Naše firma poslala do české společnosti Biotest na výzkum čistý virus běžné chřipky a záměnou se stalo, že poslala virus ptačí chřipky. Šlo o záměnu testovacího materiálu," říká zástupce rakouské pobočky společnosti Baxter Richard Tischler.

Podle něj bylo riziko, že se ptačí chřipka dostane z laboratoří ven, velmi nízké. "Postup, který byl použit k výrobě výzkumného materiálu, se už nikdy opakovat nebude," podotýká Tischler.

Všechny čtyři testovací laboratoře byly vyčištěny, pracovníci, kteří s virem pracovali, dostali lék tamiflu a jsou nadále pod lékařským dohledem. "Žádný z českých pracovníků nakažený nebyl," říká Vít

MfD: Vakcína kontaminovaná ptačí chřipkou se testovala v Evropě

Vitalia.CZ, 4 March 2009
https://www.vitalia.cz/clanky/mfd-vakcina-kontaminovana-ptaci-chripkou-se-testovala-v-evrope/

Testovací vakcínu, kterou zkoumala společnost BioTest a která byla podle firmy BioTest chybou dodavatele kontaminovaná virem ptačí chřipky H5N1, údajně lidé z rakouské pobočky farmaceutické firmy Baxter netestovali jen v Česku, ale i v jiných evropských zemích.

Informovala o tom Mladá fronta Dnes (MfD). Již dříve list uvedl, že virus H5N1 nedopatřením obsahovala vakcína firmy Baxter, kterou BioTest testoval v Konárovicích na Kolínsku. Při výzkumu této vakcíny nebyl nikdo z jejích pracovníků nakažen.

"Vakcína nakažená ptačí chřipkou se testovala v samotném Rakousku, České republice, Německu a ve Slovinsku. A všude se tento problém vyskytl," řekl MfD hlavní hygienik ČR Michael Vít. V žádné z laboratoří o tom neměli tušení, píše list.

Podle deníku poslali na konci ledna farmaceuti z Rakouska nedopatřením do čtyř laboratoří na výzkum virus, který je pro svou nebezpečnost zaznamenán do seznamu možných biologických zbraní.

Českou laboratoř teď už stíhá Státní úřad pro jadernou bezpečnost, píše list. Úřad podle deníku nikdo z rakouské ani české strany neinformoval. "Máme za to, že došlo k porušení oznamovací povinnosti. Přitom virus ptačí chřipky H5N1 patří na seznam nebezpečných látek," řekla MfD předsedkyně Státního úřadu pro jadernou bezpečnost Dana Drábová. S konárovickou firmou Biotest proto v nejbližších dnech podle MfD zahájí správní řízení. "Jestli se vina prokáže, hrozí pokuta, která může v extrémním případě dosáhnout až pěti milionů korun," uvedla Drábová.

MfD píše, že v rakouské pobočce začali pracovat kontroloři Evropské agentury pro léčivé přípravky. "Případ ještě není uzavřen," řekl listu Josef Duben ze Státní veterinární správy.

Zástupce rakouské pobočky společnosti Baxter Richard Tischler uvedl, že šlo o záměnu testovacího materiálu.

Pracovníci, kteří se na výzkumu podíleli, jsou stále pod lékařských dohledem.

Mary Marshall, A ProMED-mail post; ProMED.mail, 26 February 2009
https://www.indybay.org/newsitems/2009/11/18/18629109.php

Официальные лица пытаются добраться до сути вопроса, а именно как производитель вакцин Baxter International Inc разработал "экспериментальный вирусный материал", основанный на штамме человеческого гриппа, но загрязненный вирусом птичьего гриппа, и в последующем, распространенного через Австрийскую компанию. Эта компания, Avir Green Hills Biotechnology, в свою очередь распространила предполагаемый вирус H3N2 субконтрактерам в Чехии, Словении и Германии. В настоящее время, этот вопрос исследуется 4-мя Европейскими странами под наблюдением ВОЗ и Европейским Центром по контролю заболеваний (ЕЦКЗ).

Хотя никто из 36 или 37 человек, которые имели контакт с биоматериалом не инфицировались, инцидент рассматривается как серьезная ошибка компании Baxter, которая является одной из ключевых сторон по гарантии Европейской лицензии по вакцине H5N1. Эта вакцина производится в другой компании в Чехии.

Согласно Др. Ангус Николь, ЕЦКЗ: "Случайное освобождение комбинации живых вирусов H5N1 и H3N2 - если бы это действительно произошло, могло бы привести к страшным последствиям. Хотя официальные лица не до конца уверены, что эта смесь содержала живые вирусы H5N1, но учитывая смерть хорьков, можно предположить, что они были живые.

В отличие от вируса H3N2, вирус H5N1 не способен легко инфицировать человека. Оба вируса относятся к вирусам типа А, которые ежегодно поражают людей в сезон гриппа. Если кто-то заразится этой комбинацией вирусов, то этот человек будет служить инкубатором для гибридного вируса, которым можно будет легко заразить других людей. Эта рекомбинация может привести к пандемическому вирусу.

Согласно исследованиям ученых из Центра по контролю заболеваний США, в лабораторных условиях эти 2 вируса легко сцепляются. Хотя и менее вирулентные чем H5N1, часть вирусов, появившихся в результате сцепления могут быть достаточно опасными.

Baxter International, компания находящаяся в Иллинойсе, утверждает, что это произошло в результате ошибки ее научного отдела, который находится в Австрии. Этот отдел по контракту от компании Avir Green Hills должен был произвести "экспериментальный вирусный материал" на основе человеческого вируса H3N2. Со слов Кристофера Бона, директора Baxter по глобаль-

ным коммуникациям, жидкий вирусный продукт не является вакциной, а лишь экспериментальным материалом для использования на животных.

Сигнал тревоги впервые был получен в феврале 2009, когда суб-контракторы в Чехии сделали прививку этим биоматериалом хорькам, которые очень быстро скончались, хотя они не должны умирать от вируса человеческого гриппа. Предварительное исследование показало, что биоматериал был загрязнен вирусом H5N1, который летален для хорьков. Согласно Бону, Baxter определил, что произошла контаминация и принял соответствующие меры.

Baxter единственный производитель вакцин, который работает с "дикими" видами вируса гриппа и придерживается стандартов уровня биобезопасности BSL3. Те кто знаком с этим уровнем биобезопасности в ужасе от факта, что в научной лаборатории Baxter могло произойти смешивание этих двух вирусов по какой-то случайности. Компания не объясняет ясно как могла произойти такая ошибка. Baxter помог всем вовлеченным компаниям уничтожить загрязненный биоматериал, а людям, которые имели контакт с биоматериалом, был назначен Тамифлю и они находятся под наблюдением.

[Модератор HP. Команда Промед приносит извинения читателям, так как вчера в рассылке была отправлена непроверенная информация, переданная российским агентством ИТАР-ТАСС и переданная по ТВ телеканалом "Вести". В этой информации допущена неточность и биоматериал назван вакциной. Комментарий, данный к сообщению не отражает точку зрения команды Промед, а отражает точку зрения отдельного специалиста]

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Paul Joseph Watson

'Accidental' Contamination Of Vaccine With Live Avian Flu Virus Virtually Impossible

Info Wars, 5 March 2009
https://web.archive.org/web/20090307100116/http://www.infowars.com/%E2%80%98accidental%E2%80%99-contamination-of-vaccine-with-live-avian-flu-virus-virtually-impossible/

Czech newspapers are questioning if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

The claim holds weight because, according to the very laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is *virtually impossible*.

"The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses," reports the Canadian Press.

Baxter flu vaccines contaminated with H5N1 - otherwise known as the human form of avian flu, one of the most deadly biological weapons on earth with a 60% kill rate - were received by labs in the Czech Republic, Germany, and Slovenia.

Initially, Baxter attempted to stonewall questions by invoking "trade secrets" and refused to reveal how the vaccines were contaminated with H5N1. After increased pressure they then claimed that pure H5N1 batches were sent by accident. This was seemingly an attempt to quickly change the story and hide the fact that the accidental contamination of a vaccine with a deadly biological agent like avian flu is virtually impossible and the only way it could have happened was by wilful gross criminal negligence.

According to a compiled translation from Czech newspaper stories, the media over there is asking tough questions about whether the contamination was part of a deliberate attempt to start a pandemic.

"Was this just a criminal negligence or it was an attempt to provoke pandemia using vaccination against flu to spread the disease - as happened with the anti-B hepatitis vaccination with vaccines containing the HIV virus in US? - and then cash for the vaccines against H5N1 which Baxter develops? How could on Earth a virus as H5N1 come to the ordinary flu vaccines? Don't they follow even basic precautions in the american pharma companies?" states the translation.

The fact that Baxter mixed the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is the smoking gun. The H5N1 virus on its own has killed hundreds of people, but it is less airborne and more restricted in the ease with which it can spread. However, when combined with seasonal flu viruses, which as everyone knows are super-airborne and easily spread, the effect is a potent, super-airbone, super deadly biological weapon.

As the Canadian Press article explains, "While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people."

There can be little doubt therefore that this was a deliberate attempt to weaponize the H5N1 virus to its most potent extreme and distribute it via conventional flu vaccines to the population who would then infect others to a devastating degree as the disease went airborne.

The Canadian Press article states, "That mixing process, called reassortment, is one of two ways pandemic viruses are created," but then claims that there is no evidence that this is what Baxter were doing, despite there being no clear explanation as to why Baxter has samples of the live avian flu virus on its premises in the first place.

However, to reiterate, the key aspect of this story is that it is *virtually impossible* for live avian flu virus to find its way into a vaccine by "accident".

As health expert Mike Adams points out, "The shocking answer is that *this couldn't have been an accident*. Why? Because Baxter International adheres to something called BSL3 (Biosafety Level 3) - a set of laboratory safety protocols that prevent the cross-contamination of materials."

As explained on Wikipedia (http://en.wikipedia.org/wiki/Biosaf…):
"Laboratory personnel have specific training in handling pathogenic and potentially lethal agents, and are supervised by competent scientists who are experienced in working with these agents. This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features."

Under the BSL3 code of conduct, it is impossible for live avian flu viruses to contaminate production vaccine materials that are shipped out to vendors around the world. This leaves only two possibilities that explain these events:

Possibility #1: Baxter isn't following BSL3 safety guidelines or is so sloppy in following them that it can make monumental mistakes that threaten the safety of the entire human race. And if that's the case, then why are we injecting our children with vaccines made from Baxter's materials?

Possibility #2: A rogue employee (or an evil plot from the top management) is present at Baxter, whereby live avian flu viruses were *intentionally* placed into the vaccine materials in the hope that such materials might be injected into humans and set off a global bird flu pandemic.

Spreading bird flu would create an instantaneous surge of demand for bird flu vaccines. The profits that vaccine companies such as Baxter International could reap out of such a panic are astronomical. <...>

This is not the first time that vaccine companies have been caught distributing vaccines contaminated with deadly viruses.

In 2006 it was revealed that Bayer Corporation had discovered that their injection drug, which was used by hemophiliacs, was contaminated with the HIV virus. Internal documents prove that after they positively knew that the drug was contaminated, they took it off the U.S. market only to dump it on the European, Asian and Latin American markets, knowingly exposing thousands, most of them children, to the live HIV virus. Government officials in France went to prison for allowing the drug to be distributed. The documents show that the FDA colluded with Bayer to cover-up the scandal and allowed the deadly drug to be distributed globally. No Bayer executives ever faced arrest or prosecution in the United States.

NEWWORLDLIBERTY

Bioterrorism Attack Plotted by New World Order

New World Liberty, 5 March 2009.
https://web.archive.org/web/20090501192037/http://newworldliberty.wordpress.com/2009/03/05/bioterrorism-attack-plotted-by-new-world-order

Alex Jones and Bill Cooper predicted the 9/11 terrorist attacks, staged by the U.S. government, 2-3 months before 9/11. They also predicted the government would blame the 9/11 terrorist attacks on Osama bin Laden.

Alex Jones is now predicting a bioterrorism attack being plotted by the New World Order, possibly for 2009, by connecting dots. Some of these dots are connected in this InfoWars.com article: U.S. Air Force Study Proposed 2009 Influenza Pandemic in 1996.

More dots here in this InfoWars.com article: 'Accidental' Contamination Of Vaccine With Live Avian Flu Virus Virtually Impossible.

Do you understand? Baxter shipped a deadly combination of weaponized Avian bird flu. This is on purpose. A subcontractor tested and caught the shipment. This is mainstream news.

Bioweapon scientists are getting murdered. Avian bird flu crisis are always in the news. They are hyping the Avian bird flu even though in normal form, it isn't that deadly. In weaponized, bioengineered forms, it is very deadly. Avian bird flu research is the center of it.

9/11 and the economic crisis was all to set the stage for martial law when they bring in the bioterrorism, with bioengineered Avian bird flu the weapon of choice by the New World Order against the people of the world. While HIV was bioengineered to attack Africa and gay men slowly, Avian bird flu is targetted at killing everyone, quickly.

Evelyn Rothschild, David Rockefeller, the ruling elite, their numerous shadow government organizations, and their numerous agents of death, such as Henry Kissinger and Zbigniew Brzezinski, really are trying to depopulate and enslave the world. This is the real axis of evil. These trillionaires and owners of the central banks, media, other key industres, and governments are the real terrorists.

LIVEJOURNAL FIND MORE SHOP HELP

Случайное загрязнение вакцины живым птичьим вирусом гриппа - невозможно
Птичий грипп был в вакцинах против птичьего гриппа

Перевод на руксския язык статьи - Russian Translation of the Article:

Paul Joseph Watson
'Accidental' Contamination Of Vaccine With Live Avian Flu Virus Virtually Impossible
Prison Planet.com, 5 March 2009

Опубликован на *Live Journal* (imperialcommiss), 25 November 2010
https://imperialcommiss.livejournal.com/229753.html?
https://web.archive.org/web/20090307100116/http://www.infowars.com/%E2%80%98accidental%E2%80%99-contamination-of-vaccine-with-live-avian-flu-virus-virtually-impossible/

Чешские газеты подвергают сомнению, что обнаружение вакцин загрязненных смертельным птичьим вирусом гриппа, которые предназначались 18 странам, изготовленные американской компанией, Baxter International не был частью заговора, с целью вызвать пандемию.

Предположение не лишено основания, потому что, согласно лабораторным требованиям безопасности, которые являются обычными для изготовителей вакцины, смешать живое вирусное биологическое средство с материалом вакцины случайно, фактически невозможно.

"Компания, которая выпускала загрязненный материал вируса гриппа с завода в Австрии, подтверждала в пятницу, что экспериментальный продукт содержал живой H5N1 - вирус птичьего гриппа", сообщает канадская Press.

Бакстер загрязнил вакцины вирусом гриппа H5N1 иначе известным как человеческая форма птичьего гриппа, одно из самых смертельных биологических средств на земле - средняя смертность в 60%. "Вакцины" были получены лабораториями в Чешской республике, Германии, и Словении.

Первоначально, Бакстер попытался не отвечал на вопросы, взывая к "торговым секретам" и отказался признать, что вакцины были загрязнены H5N1. Под давлением Бакстер признал, что в чистые партии вакцины вирус H5N1 посылали случайно. Это было по-видимому попыткой быстро изменить историю произошедшего и скрыть факт, что случайное загрязнение вакцины со смертельным биологическим агентом как птичий грипп является фактически невозможным, и единственный путь, как это могло случиться, был преднамеренный и преступный.

"Было это просто преступной небрежностью или попытка состояла в том, чтобы вызвать эпидемию, используя прививки против гриппа, чтобы распространить болезнь - как случилось с anti-B прививкой гепатита с вакцинами, содержащими ВИЧ вирус в США? - а уже затем продать за деньги вакцины против H5N1, который развивает Бакстер? Как мог оказаться вирус, H5N1 в обычных вакцинах от гриппа? Разве они не следуют за даже основными предосторожностями в американских фармакологических компаниях?".

То что Бакстер смешал смертельный вирус H5N1 с соединением сезонных вирусов гриппа H3N2, является уликой. Вирус H5N1 сам по себе уже убил сотни людей, но трудно распространяется. Однако, если его объединить с сезонными вирусами гриппа, которые, поскольку каждый знает, передаются воздушным путем и также легко распространяются, полученный эффект равен созданию мощного, распространяемого по воздуху, смертоносного биологическое оружие высшего качества.

https://web.archive.org/web/20090321065029/http://bimchat.wordpress.com/2009/03/05/live-avian-flu-virus-placed-in-baxter-vaccine-materials-sent-to-18-countries/

Deerfield, Illinois-based pharmaceutical company Baxter International Inc. has just been caught shipping live avian flu viruses mixed with vaccine material to medical distributors in 18 countries.

The "mistake" (if you can call it that, see below…) was discovered by the National Microbiology Laboratory in Canada. The World Health Organization was alerted and panic spread throughout the vaccine community as health experts asked the obvious question: How could this have happened?

> "Baxter International Inc. in Austria 'unintentionally contaminated samples with the bird flu virus that were used in laboratories in 3 neighbouring countries, raising concern about the potential spread of the deadly disease'. Austria, Germany, Slowenia and the Czech Republic – these are the countries in which labs were hit with dangerous viruses. Not by bioterrorist commandos, but by Baxter. In other words: One of the major global pharmaceutical players seems to have lost control over a virus which is considered by many virologists to be one of the components leading some day to a new pandemic. (http://www.lifegen.de/newsip/showne)

But there's a bigger question in all this: How could this company have accidentally mixed LIVE avian flu viruses (both H5N1 and H3N2, the human form) in this vaccine material?

The shocking answer is that this couldn't have been an accident. Why? Because Baxter International adheres to something called BSL3 (Biosafety Level 3) – a set of laboratory safety protocols that prevent the cross-contamination of materials.

"Laboratory personnel have specific training in handling pathogenic and potentially lethal agents, and are supervised by competent scientists who are experienced in working with these agents. This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features."

Хроника "Бакстериологической диверсии"

Livejournal, 5 марта 2009
https://galimsky.livejournal.com/275312.html?
https://web.archive.org/web/20090310022920/http://infoporn.org.ua/2009/03/05/hronyka_baksteryologycheskoyi_dyversyy

Все началось с того, что месяц назад в лаборатории Biotest неподалеку от Праги сдохли подопытные хомячки, а в австрийской «Avir Green Hills» – хорьки. Следом поступили сигналы из Германии и Словении: в разных частях Европы лабораторные животные, которым вводили присланный обычной почтовой бандеролью экспериментальный биопрепарат, очень быстро и дружно умирали. Казалось бы, ничего особенного. Подопытные животные отдают свои жизни для того, чтобы двигать вперед науку и спасать жизнь людей. Но в данном случае явно что-то не заладилось: все сотрудники лабораторий, контактировавшие со зверьками, были немедленно изолированы, помещены в карантин и пролечены самыми современными препаратами. Всего под пристальным наблюдением медиков оказалось около сорока человек по всей Европе. И что самое страшное: в организмах умерших животных был обнаружен смертельно опасный для людей штамм вируса птичьего гриппа H5N1.

Представители американской фармацевтической фирмы «Бакстер» (Baxter International Inc.), которая рассылала смертоносное вещество своим европейским партнерам, сначала отвергали все претензии. По их словам, в препаратах, которые вводились животным в лабораториях из европейских партнеров, вирус птичьего гриппа не содержался.

После того, как в дело вмешались австрийские власти, выяснилось, что на самом деле все гораздо хуже. В присланном из-за океана обычной почтовой бандеролью препарате содержалась смесь вирусов птичьего гриппа H5N1 и обычного, «человеческого» H3N2.

Соединение вируса H5N1 с «человеческим» – этот ночной кошмар вот уже несколько лет преследует эпидемиологов всего мира. Если вдруг в результате мутаций появится такой гибрид, то он будет распространяться со скоростью обычной эпидемии гриппа, и при этом большинство заболевших ожидает смерть. Животные, которым ввели смесь вирусов двух типов, по сути превращаются в «инкубатор» для выведения гибридов. Действенного лечения птичьего гриппа не существует, поэтому эксперты в таком случае предсказывают конец цивилизации: в считанные дни обезлюдеют целые континенты, а немногие оставшиеся в живых вернутся в каменный век.

Только после этого представители фирмы «Бакстер» признали тот факт, что в рассылаемом ими веществе находились возбудители «обычного» гриппа, якобы случайно загрязненного вирусом гриппа птичьего при упаковке. При этом они до сих пор пытаются доказать, что препарат не содержал живых вирусов, хотя независимые эксперты не сомневаются в обратном.

К сожалению, пояснения Baxter International вызывают все новые и новые вопросы. В своих запоздалых «отмазках» представители фирмы особо настаивают на двух обстоятельствах.

Во-первых, они утверждают, что присланный препарат является не вакциной, а «экспериментальным вирусным материалом». Увы: это заявление выглядит весьма и весьма сомнительным.

Как сообщает «Радио Прага», исследования в лаборатории Biotest проводились по согласованию с чешскими властями. Естественно, в государственные инстанции подавалась информация о проводимых исследованиях. И «Радио Прага», и главный санитарный врач Чехии недвусмысленно говорят, что животным вводилась именно вакцина. Отсюда можно сделать вывод: даже если это и был «экспериментальный вирусный материал», то в Чехию он ввозился под видом вакцины, то есть подлог налицо.

Во-вторых, в такой ситуации трудно объяснить реакцию работников лабораторий. Смерть животных явно была для них полной неожиданностью, то есть «экспериментальный вирусный материал» не должен был вызывать настолько тяжелого ухудшения их здоровья. Даже если предположить, что хомячков заражали относительно безопасным для них «человеческим» штаммом H3N2, все равно должны были соблюдаться меры предосторожности: именно этот штамм сейчас «гуляет» по Европе, вызывая сезонную вспышку гриппа. В сложившейся ситуации очевидно: предполагалось, что «экспериментальный вирусный препарат» абсолютно безопасен для людей и несмертелен для животных. Напомню, что классические «живые» вакцины содержат возбудителей, ослабленных до такой степени, что не могут передаваться от привитого к непривитым.

Наконец, возникает закономерный вопрос: а какие именно эксперименты пришлось проводить одновременно в лабораториях подрядчиков нескольких стран мира? Напомню: в прошлом году фирма «Бакстер» начала испытывать вакцину от птичьего гриппа. Ею были привиты студенты в Каунасе и добровольцы в Австрии и Индонезии, результаты позитивные. Самое время начать процесс регистрации вакцины в тех странах, где запланированы продажи. Кстати, чешский Biotest как раз специализируется на доклинических испытаниях и исследованиях. Кроме того, в Чехии не сомневаются, что и в других странах также происходили испытания вакцины.

Ответ на этот вопрос могли бы дать представители Всемирной организации здравоохранения (ВОЗ), которые находятся в тесном контакте с «Баксером» по этой проблеме. К сожалению, за две недели нарастающего скандала самая авторитетная медицинская организация не сочла нужным опубликовать хоть какой-то комментарий по данному вопросу. Из уст ВОЗовских экспертов звучит невнятное бормотание о том, что расследование этого вопроса может создать угрозу интересам компании «Бакстер». И это при том, что смертельно опасный штамм вируса был передан американской компании из архива ВОЗ, и, по заявлению фирмы, этой организации была передана полная информация о данном инциденте.

Нет никаких сомнений, что коммерческие интересы американской фармацевтической компании для Всемирной организации здравоохранения гораздо важнее, чем жизнь и здоровье сотрудников лабораторий, не предупрежденных об опасности, работников почты, обрабатывающих немаркированные посылки со смертельно опасным возбудителем, и даже чем угроза пандемии, способной в считанные дни уничтожить человечество.

Также представители «Бакстер» настаивают, что смешение двух штаммов произошло случайно, как разовое трагическое стечение обстоятельств. Опрошенные мною эксперты разошлись во мнениях. Одни утверждают, что в вирусологии возможны и не такие случайные события, и придерживаются мнения, что произошедшее – действительно случайность. Другие говорят, что возможность заражения биопрепарата особо опасным возбудителем исключается в принципе, еще на этапе проектирования лаборатории и планирования процессов. Они в принципе допускают загрязнение «человеческим» вирусом, например, от больного сотрудника. Но неумышленное загрязнение высокопатогенным штаммом, находящимся в пробирке под строгим контролем, они исключают полностью.

По словам представителей фирмы, загрязнение произошло при отгрузке. К сожалению, такое заявление не вызывает доверия. Да, я могу представить, что грузчики Мухосранского мясокомбината перепутали этикетки и запачкали сосиски грязными сапогами. Но австрийская

лаборатория, где якобы произошло то событие, сертифицирована по самому высокому уроню безопасности BSL3. И чем выше этот уровень, тем меньше шансов остается версии о «случайности», тем больше возникает подозрений в преднамеренности таких действий.

Скандал, который за два последних дня вызвал падение акций компании Baxter Intnational на 8%, продолжается. Немецкая пресса анонсировало расследование по вопросам биологической безопасности при проведении лабораторных исследований, итоги которого будут опубликованы в понедельник, 9 марта. Кроме того, по всей видимости, нас ждут новые шокирующие обстоятельства. Напомню: первоначально сообщалось о том, что «экспериментальные вирусные материалы» отправлялись в лаборатории трех стран: Чехии, Австрии и Словении. Позже к им добавилась Германия. Канадская пресса заявляет, что образцы отправлялись в лаборатории 18 государств, список которых пока неизвестен. Это полностью соответствует версии о том, что проводились доклинические испытания вакцины для ее последующей регистрации в различны странах. Так, Компания «Бакстер» анонсировала свои намерения зарегистрировать вакцину от птичьего гриппа в Российской Федерации. Если в числе этих 18 стран есть и российские лаборатории, это может объяснить ту «молчанку», которую объявили данной теме российские СМИ. Один только телеканал «Вести» уделил скандалу несколько десятков секунд в сводке новостей.

…

THE TIMES OF INDIA

Virus mix-up by lab could have resulted in pandemic

The Times of India, 6 March 2009
http://timesofindia.indiatimes.com/Health--Science/Science/Virus-mix-up-by-lab-could-have-resulted-in-pandemic/articleshow/4230882.cms

It's emerged that virulent HSN1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the HSN1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, unexpectedly, ferrets inoculated with the sample had died. It turned out the sample contained live HSN1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen!'

Accidental release of a mixture of live HSN1 and H3N2 viruses could have resulted in dire consequences. While HSN1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.

Virus mix-up by lab could have resulted in pandemic swine flu

MapCruzin, 27 April 2009
Source: Times of India, 6 March 2009
https://web.archive.org/web/20221002232137/https://mapcruzin.com/news/swine-flu042709e.htm

SWINE FLU

Swine Flu Epidemic/ H1N1 Vaccine Deaths and Injuries

Swine Flu, 6 March 2009
http://vaccineriskawareness.com/swine-flu/

Now in April we are hearing of dozens of cases of people in Mexico, dying of 'swine flu'. I think the Baxter accident and the swine flu are related.

It's emerged that virulent H5N1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the H5N1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, unexpectedly, ferrets inoculated with the sample had died. It turned out the sample contained live H5N1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen."

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences. While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.

The Right Perspective

Bird Flu Accidentally Sent As Vaccine

The Right Perspective, March 6, 2009
https://web.archive.org/web/20090430210159/http://www.therightperspective.org/bird-flu-accidentally-sent-as-vaccine/

Officials at the World Health Organization and and the European Centre for Disease Control have launched an investigation into how live Avian Bird Flu virus (both H5N1 and H3N2) was accidentally shipped to 18 countries as Bird Flu vaccine.
https://web.archive.org/web/20090309034450/http://www.prisonplanet.com/vaccines-as-biological-weapons-live-avian-flu-virus-placed-in-baxter-vaccine-materials-sent-to-18-countries.html

Deerfield, Illinois-based pharmaceutical company Baxter International Inc. accidentally sent an "experimental virus material," which mixed H3N2 seasonal flu viruses and unlabelled H5N1 viruses, to an Austrian research firm, Avir Green Hills Biotechnology in late December. That company then shipped portions of the mixture to sub-contractors in the Czech Republic, Slovenia and Germany.

Subcontractors in the Czech Republic caught the error in early February when testing the shipment on ferrets. The animals died from the inoculation, indicating a live Bird Flu virus.

Officials say the 37 people who were exposed to the virus have so far not shown any signs of infection. However, an Austrian news article from February 11 reports a Vienna hospital treated 19 outpatients on February 9 because of exposure to "bird flu virus." The article said no one was sick, there was no evidence of infection, and the females were prophylaxed with antivirals (presumably Tamiflu).

People infected with a mixture of H5N1 and H3N2 viruses could become incubators for a hybrid virus able to transmit easily to and among people.

Baxter International Inc. follows a BSL3 (Biosafety Level 3) protocol which prevents the cross-contamination of materials. "It was a combination of just the process itself, (and) technical and human error in this procedure," said Christopher Bona, Baxter's director of global bioscience communications. Bona would not give any more information due to "trade secrets".

The mishap comes at an unfortunate time for Baxter International Inc., which was just about to secure a European-wide license for the Avian Bird Flu vaccine.

Америка заметает следы!

Infocorn, 9 марта 2009;
https://web.archive.org/web/20090312080439/http://infocorn.org.ua/2009/03/09/ameryka_zametaet_sledy

Новости из-под электронного микроскопа.

На международной конференции вирусов гриппа было принято решение об окончательной элиминации человечества на Европейском континенте. «Мы признательны американской компании «Бакстер Интернешнл» за неоценимый вклад в развитие межвидового сотрудничества. Только объединившись, мы сможем решить все проблемы с людьми», – заявил Авиан Флю, представитель штамма H5N1, австрийский специалист по хорькам и хомячкам.

Суетливые телодвижения вокруг скандала с американской компанией «Бакстер Интернешнл» (Baxter International, Inc, NYSE:BAX), о котором я писал в своей предыдущей статье, равно как и очевидные попытки замять ситуацию, приводят к противоположным результатам. Все больше специалистов пытаются выяснить, что же на самом деле происходило в австрийской лаборатории этой компании, все больше журналистов обращаются к этой теме.

Скандал вокруг рассылки по почте потенциальных компонентов биологического оружия, широко освещается в немецких и чешских СМИ, лаборатории которых получали смертоносные бандероли с возбудителями птичьего гриппа. Очень серьезное внимание уделяет этой теме канадская пресса. В то же время в СМИ самых демократических стран мира, в частности, Соединенных Штатов и Российской Федерации, по-прежнему царит гробовая тишина: здесь можно найти разве что единичные публикации на эту тему. Также мертвое молчание по поводу данного инцидента продолжает хранить и Всемирная организация здравоохранения (ВОЗ). Отдельные выступления её представителей лишь дублируют официальные заявления представителей «Бакстер» и напускают всё больше тумана в эту, и без того двусмысленную, ситуацию.

Восемь лет назад рассылка по почте конвертов с «белым порошком» (который на поверку оказывался тальком или гипсом) привела к военному вторжению в Афганистан. Одно только подозрение о том, что Садам Хуссейн разрабатывает биологическое оружие, стало поводом для войны в Ираке. Зато недавно выявленная рассылка по почте немаркированных бандеролей со смертельно опасным вирусом американской компанией в другие страны, то есть – бесспорное подтверждение как минимум факта проведения экспериментов с нарушением правил и норм безопасности, не рассматривается как повод для каких-либо санкций и вообще не считается событием, достойным внимания. Особую пикантность ситуации придает очевидная «зачистка» информационного пространства: в англоязычном сегменте Интернета наиболее острые публикации исчезают буквально на глазах, и от них остаются лишь «пустые» ссылки в других сообщениях и в поисковых системах.

Заявления официальных представителей Baxter International напоминают фразу из рекламы о том, что «иногда лучше жевать, чем говорить». Так, они настаивают, что заражение рассылаемого вещества опасным вирусом произошло вследствие ошибки, а в целом австрийская

лаборатория этой компании соответствует высочайшим критериям безопасности BSL-3. Если внимательно изучить эти критерии, можно придти к неутешительным выводам: в данной лаборатории, по всей видимости, осуществлялись незаконные эксперименты со смертоносными штаммами, которые проводились в «нейтральной», то есть безопасной, зоне, видимо, чтобы не привлекать излишнего внимания австрийских властей. Какие это были эксперименты, нам сейчас остается только догадываться. А тот факт, что во главе совета директоров фармацевтической кампании Baxter International стоит бывший первый заместитель командующего Корпуса морской пехоты США, четырехзвездный генерал Уолтер Бумер (Walter E. Boomer), дает широкий простор для фантазии.

Еще одна «линия защиты» компании Baxter International заключается в упорном и многократном отрицании того, что разосланные образцы являются вакциной. Компания называет их «экспериментальным вирусным материалом» на основе «человеческого» штамма H3N2. Однако, как сообщило недавно авторитетное издание Bloomberg News со ссылкой на представителей австрийских властей, в чешской лаборатории присланный материала в начале месяца была использован для приготовления вакцины, которую и вводили подопытным животным. Маловероятно, чтобы это производилось самовольно, без прямого на то указания заказчика – фирмы «Бакстер». Что характерно, американское ведомство CDC, которое не только следит за соблюдением требований безопасности в американских компаниях, но и регулярно рассылает фармацевтическим кампаниям образцы вирусов гриппа для производства вакцин, не видит повода для беспокойства, не проводит расследований и консультаций по данному инциденту.

По информации ВОЗ, на данный момент разработку вакцин против птичьего гриппа ведут более двадцати фармацевтических компаний. Это значит, что более двадцати компаний в сотнях лабораторий по всему миру проводят эксперименты с опаснейшими живыми возбудителями. Как показали события в Австрии, ни высочайший авторитет разработчиков, ни соблюдение самых строгих требований безопасности, ни жесткий контроль со стороны государственных органов не гарантируют, что смертоносный вирус не выйдет за пределы лаборатории.

Во многих публикациях события, произошедшие месяц назад в Европе, сравнивают со сценарием американского блокбастера. И в лучших традициях Голливуда, как только была обнаружена утечка, прошла спецоперация «зачистка». Как рассказал в телефонном интервью Bloomberg News официальный представитель «Бакстера» Кристофер Бона (Christopher Bona), сотрудники этой компании очень быстро уничтожили все разосланные образцы во всех странах, провели двукратную дезинфекцию лабораторий. Все сотрудники, контактировавшие с подозрительным веществом, были немедленно изолированы, помещены в карантин и пролечены мощнейшим антивирусным препаратом. Это, конечно, замечательно, но по правилам ВОЗ в таких случаях обязательно должны отбираться образцы материалов для обеспечения возможности дальнейшего расследования. В нынешней ситуации, когда правду установить уже невозможно, нам остается только верить скудным официальным заявлениям. Или – строить собственные предположения.

На сегодняшний день я знаю две фармацевтические компании, которые занимались разработкой вакцины против птичьего гриппа по договоренности с ВОЗ. Одна из них – американская, Baxter International Inc. Вторая – Serum Institute of India, Ltd. Как сейчас стало известно, работы в этом направлении были начаты в Индии еще в 2006 году. Два месяца назад было объявлено об успешном завершении исследований и начале клинических испытаний индийской вакцины.

Serum Institute – это та самая индийская фирма, которая изготовила печально известную вакцину против кори и краснухи, более известную как «КаКа». После того, как весной прош-

лого года была предпринята попытка провести незаконную и необоснованную кампанию, в ходе которой предполагалось ввести незарегистрированный препарат восьми миллионам молодых украинцев, осталось множество неясностей и вопросов, ответов на которые нет и по сей день. Например, до сих пор неизвестно, что находится в прилагаемом к вакцине растворителе. Это странное вещество, заявленное как «вода для инъекций», при ввозе в Украину не проверялось. При этом оно вызывает странное изменение цвета раствора, а температурный режим хранения его в точности соответствует режиму хранения вакцины против гриппа. Что характерно, инструкция к вакцине гласит, что прилагаемая к вакцине «вода для инъекций» якобы «специально разработана» для этой вакцины. Изготовитель категорически запрещает применение любого другого растворителя, а также обычной воды для инъекций, равно как и использование прилагаемого к препарату растворителя в любых других целях.

Напомню, что та внеплановая вакцинация планировалась и проводилась с полным игнорированием украинского законодательства и медицинских соображений, под жестким прессингом ВОЗ, который можно было наблюдать до самого недавнего времени. Также стоит вспомнить, что после приостановки этой весьма сомнительной акции все усилия украинского Минздрава и представителей международных организаций были направлены на обеспечение неприкосновенности «застрявшей» в Украине вакцины с растворителем и недопущения независимого исследования их содержимого.

Надеюсь, ответы хотя бы на некоторые вопросы, касающиеся «КаКи», мы сможем получить в ходе судебного разбирательства по иску Александра Славского, которое начнется 12 марта 2009 года в 11 часов 40 минут в Окружном административном суде г. Киева.

Многие задаются вопросом: не была ли Украина в списке тех 18 стран, куда были направлены «загрязненные образцы»? Не поступали ли в последние месяцы в украинские лаборатории биоматериалы от американской компании Baxter International?

Печальная судьба польских бездомных, которых за гроши привлекали к незаконным испытаниям вакцины против птичьего гриппа, заставляет задуматься и о судьбе наших сограждан.

LifeGen.de

H5N1 out of control: Labs under bioterrorist and pandemic threat

LifeGen.de, 10 March 2009

https://web.archive.org/web/20090325091653/http://www.lifegen.de/newsip/shownews.php4?getnews=2009-03-07-3117&pc=s01

The book is scheduled for April 2009, but the Baxter-Contamination-Case in Europe may justify how necessary the reading really will be. “Detection of Highly Dangerous Pathogens: Microarray Methods for BSL 3 and BSL 4 Agents” (WILEY, ISBN: 978-3-527-32275-6) is written by leading experts in the field as part of an interdisciplinary pan-European research program funded by the EU. According to Wiley, “this book provides a unique and comprehensive overview of how microarray technology can be used in safely tracking the most highly dangerous pathogens”, and: “A must-have for public health agencies focused on bioterrorism as well as all laboratories working with BSL3 and/or BSL 4 agents”.

The publishing house is right, as a U.S. Government Accountability Office (GAO) preliminary Report revealed already in 2007: “No single federal agency, according to 12 agencies' responses to our survey, has the mission to track the overall number of BSL-3 and BSL-4 labs in the United States”. Another Report to the Chairman, Committee on Homeland Security, House of Representatives, issued on February 26th this year resumes the worst case: “Although certain performance measures have been established in the National Pandemic Implementation Plan to prepare for an influenza pandemic, these measures are not always linked to results”. The Baxter H5N1 Contamination in Europe was not the first global viral accident in BSL labs, as governmental documents from 2007 reveal. *by Vlad Georgescu*

Highly pathogenic virus-samples are sen t around the globe by many pharmaceutical and biotech companies. They work with lethal viruses, and many of these labs have subcontractors which can't secure the deadly stuff in an appropriate way. And, worst of all, security lacks could initiate a new bioterrorist threat coming from inside western countries – not because of Baxter, but because it became evident that samples can be out of routine control even if belonging to pharmaceutical giants working very professional - usually.

But as our coverage of the Baxter-Contamination Story in Europe on February 26th 2009 revealed, there are massive security lacks among the routines, even if Baxter is denying that fact. Jutta Brenn-Vogt, Manager Communications at Baxter Deutschland GmbH explained LifeGen.de what happened with H5N1: "Causes were a unique combination of process, technical and human errors". US and European officials should be worried about another statement made by Baxter in Germany: “As this material was not produced for human use, testing for potential contamination is not routinely carried out”.

This may lead to the question why one of the biggest pharmaceutical companies doesn’t consider routine testing for all samples as a crucial security measure – and how samples declared as for non-human use are controlled at all.Financial investors did understand the risk of such details. Shares of the big pharmaceutical company in Deerfield, IL, lost more than 8 percent in only two days after LifeGen.de started to report about the H5N1 Contamination in Europe. Before, PROMED and Bloomberg mentioned the story, but obviously with far less response on a global scale, as a look at the charts from February 26th at Google Finance reveals.

No wonder Baxter's Chief of Communications in the US, Christopher Bona, supported our idea for an exclusive interview, and so we got the information explaining what happened in Europe.

But after the Baxter H5N1 disaster in Europe (read our exclusive Interview [see: Baxter H5N1 Contamination – 3 march 2009]) there was another alarming news arising on the horizon. New research from the CDC, reported in JAMA, found that one strain of the influenza is becoming increasingly resistant to the frequently prescribed medicine oseltamivir. During the 2007-2008 flu season, the CDC found that 12.6% of the influenza A H1N1 viruses tested were resistant to oseltamivir. During the current season, approximately 98.5%, of influenza A (H1N1) viruses tested (to date) were resistant to oseltamivir. Such statistics are considered important as pandemic avian influenza could be on its way to conquer the world - and a mixture between avian and human strains would result in the long expected virological disaster. Under such circumstances, every uncontrolled sample reaching unknown laboratory places could be the igniting factor. Cross contaminations between different influenza strain seem to be possible, even if carried out by error. Or by bioterrorist attack.

USA: Deadly viruses out of control

U.S. Government Accountability Office (GAO) chief technologist Keith Rhodes from the Center for Technology and Engineering, Applied Research and Methods, GAO noted in late 2007 in his written testimony before the U.S. House of Representatives Subcommittee on Oversight and Investigations, Committee on Energy and Commerce that high-containment biosafety laboratories, specifically biosafety levels 3 and 4 (BSL-3 and BSL-4), have been "proliferating" since the September 11, 2001 terrorist attacks. The report is alarming, as the following excerpt demonstrates:

"A major proliferation of high-containment BSL-3 and BSL-4 labs is taking place in the United States, according to the literature, federal agency officials, and experts. The expansion is taking place across many sectors--federal, academic, state, and private--and all over the United States. Concerning BSL-4 labs, which handle the most dangerous agents, the number of these labs has increased from 5--before the terrorist attacks of 2001--to 15, including at least 1 in planning stage. Information on expansion is available about high-containment labs that are registered with the Centers for Disease Control and Prevention (CDC) and the U.S. Department of Agriculture's (USDA) Select Agent Program, and that are federally funded. However, much less is known about the expansion of labs outside the Select Agent Program, as well as the nonfederally funded labs, including location, activities, and ownership. No single federal agency, according to 12 agencies' responses to our survey, has the mission to track the overall number of BSL-3 and BSL-4 labs in the United States".

BSL-3 and BSL-4 mostly contain very hazardous biological agents, potentially to be used as bioweapons, as bacteria, viruses, fungi, and other microorganisms. The labs also can contain infectious substance which have been bioengineered or synthesized from special component of microorganism. For example, BSL-4 laboratories are working with small pox viruses (Variola major) or the plague virus (Yersinia pestis).

Labs as unknown puzzle

What Rhodes is describing exceeds the worst imagination: "Though several agencies have a need to know, no one agency knows the number and location of these labs in the United States. Consequently, no agency is responsible for determining the risks associated with the proliferation of these labs"

Rhodes and his team identified "six lessons from three recent incidents: failure to report to CDC exposures to select agents by Texas A&M; University (TAMU); power outage at the CDC's new BSL-4 lab in Atlanta, Georgia; and release of foot-and-mouth disease virus at Pirbright in the United Kingdom". The Baxter case in Europe this year seems to be only one part of the big, unknown virological puzzle.

According to Rhodes such "lessons highlight the importance of identifying and overcoming barriers to reporting in order to enhance biosafety through shared learning from mistakes and to

assure the public that accidents are examined and contained; training lab staff in general biosafety, as well as in specific agents being used in the labs to ensure maximum protection".

Rhodes suggested in 2007 to develop "mechanisms for informing medical providers about all the agents that lab staff work with to ensure quick diagnosis and effective treatment". However, before 1990, all BSL-4 labs were federal labs, as the report explains, either at USAMRIID or at the CDC. These were the good times. Today many of the BSL-4 labs are at universities and in the private sector. 143 BSL3 labs belong to the private sector, 487 are academic and 458 are said to be federal owned. The huge number is alarming, because even military labs could be under terrorist threat, as the anthrax mailings from 2001 show.

The 2001 anthrax attacks known as Amerithrax from its Federal Bureau of Investigation (FBI) case name, started on September 18, 2001. Media offices and two Democratic U.S. Senators,received letters containing anthrax spores, five people died, 17 were infected. Last year the FBI narrowed its focus to Bruce Edwards Ivins, a scientist who worked at the government's biodefense labs at Fort Detrick in Frederick, Maryland. But Ivins, who had had been told about the impending prosecution, died from an overdose of "Tylenol with Codeine," which was reported as a suicide on August 1, 2008. On August 6, 2008, federal prosecutors declared Ivins to be the sole culprit of the crime. The British magazine New Scientist published last week an article explaining from a microbiological point of view why Ivins may not be the sole culprit – security lacks and information gaps in one of Americas best protected biodefense labs seem to be part of this puzzle.

Not fully prepared for the worst case

Finally, the Baxter H5N1 Contamination Case in Europe sheds light on all these aspects. Unknown labs, unknown research, unknown attacks and accidents happen since years, and compared with the past baxter was only one more statistic among the unknown data. But why should we worried? A new GAO report titled "Influenza Pandemic: Sustaining Focus on the Nation's Planning and Preparedness Efforts" and released on February 26th this year explains what the real problem – not only for the US – may be: "Although certain performance measures have been established in the National Pandemic Implementation Plan to prepare for an influenza pandemic, these measures are not always linked to results", and: "Nevertheless, an influenza pandemic remains a real threat to our nation and the world". Even if the expected influenza pandemic did not start yet, there is no doubt about the comeback of the lethal virus: The first Pandemic Influenza occurred in three waves in the United States - exactly 90 years ago, between 1918 and 1919.

Seasonal Flu Samples Shipped to Vaccine Manufacturer were Contaminated with Live Avian Flu Virus (Bird Flu Virus). Baxter: Product contained live bird flu virus.

Barbados Free Press, 11 March 2009
https://barbadosfreepress.wordpress.com/tag/avian-flu/

By Helen Branswell, The Canadian Press

The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses.

And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by the four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died. Ferrets shouldn't die from exposure to human H3N2 flu viruses…

Baxter: Vax products contained bird flu virus

Fierce Pharma, 11 Mar 2009;
https://www.fiercepharma.com/vaccines/baxter-vax-products-contained-bird-flu-virus

Deerfield, IL-based Baxter International has confirmed that vaccine shipments sent to subcontractors in Czech Republic, Slovenia and Germany were contaminated with live H5N1 avian flu viruses. The contaminated product, which Baxter calls "experimental virus material," was a mix of H3N2 seasonal flu viruses and H5N1 viruses produced at the company's research facility in Orth-Donau. The problem was discovered when ferrets inoculated with the experimental mix died. Baxter was notified on February 6, but has kept quiet about the details surrounding the mix-up, the Canadian Press reports.

JUSTGETTHERE.US THE JOURNEY TO FREEDOM STARTS IN THE MIND

Alex Jones on Coast to Coast AM
Baxter's Flu Vaccine Contaminated with Avian Flu Virus Could Have Started Pandemic

JustGetThere.us, 11 March 2009

https://web.archive.org/web/20110414081149/http://www.justgetthere.us/blog/archives/Alex-Jones-on-Coast-to-Coast-AM-Baxters-Flu-Vaccine-Contaminated-With-Avian-Flu-Virus-Could-Have-Started-Pandemic.html

Czech newspapers are questioning if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

The claim holds weight because, according to the very laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses, reports the Canadian Press.

Baxter flu vaccines contaminated with H5N1 - otherwise known as the human form of avian flu, one of the most deadly biological weapons on earth with a 60% kill rate - were received by labs in the Czech Republic, Germany, and Slovenia.

PreventDISEASE.com
Aiming Towards Better Health

Baxter Caught Shipping Vaccines with Live Avian Flu Virus to 18 Countries Worldwide

Prevent Disease, 11 March 2009
https://web.archive.org/web/20090329061003/http://preventdisease.com/news/09/031109_baxter.shtml

Czech newspapers are questioning if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

The claim holds weight because, according to the very laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

"The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses," reports the Canadian Press.

Baxter flu vaccines contaminated with H5N1 - otherwise known as the human form of avian flu, one of the most deadly biological weapons on earth with a 60% kill rate - were received by labs in the Czech Republic, Germany, and Slovenia.

Initially, Baxter attempted to stonewall questions by invoking "trade secrets" and refused to reveal how the vaccines were contaminated with H5N1. After increased pressure they then claimed that pure H5N1 batches were sent by accident. This was seemingly an attempt to quickly change the story and hide the fact that the accidental contamination of a vaccine with a deadly biological agent like avian flu is virtually impossible and the only way it could have happened was by wilful gross criminal negligence.

"Was this just a criminal negligence or it was an attempt to provoke pandemia using vaccination against flu to spread the disease - as happened with the anti-B hepatitis vaccination with vaccines containing the HIV virus in US? - and then cash for the vaccines against H5N1 which Baxter develops? How could on Earth a virus as H5N1 come to the ordinary flu vaccines? Don't they follow even basic precautions in the american pharma companies?" states the translation.

The fact that Baxter mixed the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is the smoking gun. The H5N1 virus on its own has killed hundreds of people, but it is less airborne and more restricted in the ease with which it can spread. However, when combined with seasonal flu viruses, which as everyone knows are super-airborne and easily spread, the effect is a potent, super-airbone, super deadly biological weapon.

As the Canadian Press article explains, "While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains,

he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people."

There can be little doubt therefore that this was a deliberate attempt to weaponize the H5N1 virus to its most potent extreme and distribute it via conventional flu vaccines to the population who would then infect others to a devastating degree as the disease went airborne.

The Canadian Press article states, "That mixing process, called reassortment, is one of two ways pandemic viruses are created," but then claims that there is no evidence that this is what Baxter were doing, despite there being no clear explanation as to why Baxter has samples of the live avian flu virus on its premises in the first place.

However, to reiterate, the key aspect of this story is that it is virtually impossible for live avian flu virus to find its way into a vaccine by "accident".

As health expert Mike Adams points out, "The shocking answer is that this couldn't have been an accident. Why? Because Baxter International adheres to something called BSL3 (Biosafety Level 3) - a set of laboratory safety protocols that prevent the cross-contamination of materials."

"Laboratory personnel have specific training in handling pathogenic and potentially lethal agents, and are supervised by competent scientists who are experienced in working with these agents. This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features."

Under the BSL3 code of conduct, it is impossible for live avian flu viruses to contaminate production vaccine materials that are shipped out to vendors around the world.

This leaves only two possibilities that explain these events:

Possibility #1: Baxter isn't following BSL3 safety guidelines or is so sloppy in following them that it can make monumental mistakes that threaten the safety of the entire human race. And if that's the case, then why are we injecting our children with vaccines made from Baxter's materials?

Possibility #2: A rogue employee (or an evil plot from the top management) is present at Baxter, whereby live avian flu viruses were intentionally placed into the vaccine materials in the hope that such materials might be injected into humans and set off a global bird flu pandemic.

Experimentation of human beings is becoming the norm throughout the world by Pharmaceuticals companies who hold profits over safety. A recent report in the Telegraph covered the trials in Poland which killed 21 people. The medical staff, from the northern town of Grudziadz, are being investigated over medical trials on as many as 350 homeless and poor people last year, which prosecutors say involved an untried vaccine to the highly-contagious virus.

Authorities claim that the alleged victims received £1-2 to be tested with what they thought was a conventional flu vaccine but, according to investigators, was actually an anti bird-flu drug.

The director of a Grudziadz homeless centre, Mieczyslaw Waclawski, told a Polish newspaper that last year, 21 people from his centre died, a figure well above the average of about eight.

Spreading bird flu would create an instantaneous surge of demand for bird flu vaccines. The profits that vaccine companies such as Baxter International could reap out of such a panic are astronomical.

In addition, as we have previously reported, those that have a stake in the Tamiflu vaccine include top globalists and BIlderberg members like George Shultz, Lodewijk J.R. de Vink and former Secretary of Defense Donald Rumsfeld.

Authorities in both Europe and the U.S. have openly detailed plans for martial law, quarantine and internment should a bird flu pandemic occur.

The other motivation, as we have exhaustively documented on this website for years, is the fact that elites throughout history have openly stated that they want to see a world population reduction of around 80 per cent. Shocking stories like this take the plausibility of that narrative out of the realms of conspiracy theory and into the dangerous reality of conspiracy fact.

"Baxter is acting a whole lot like a biological terrorism organization these days, sending deadly viral samples around the world. If you mail an envelope full of anthrax to your Senator, you get arrested as a terrorist. So why is Baxter – which mailed samples of a far more deadly viral strain to labs around the world – getting away with saying, essentially, "Oops?", Adams concludes.

This is not the first time that vaccine companies have been caught distributing vaccines contaminated with deadly viruses.

In 2006 it was revealed that Bayer Corporation had discovered that their injection drug, which was used by hemophiliacs, was contaminated with the HIV virus. Internal documents prove that after they positively knew that the drug was contaminated, they took it off the U.S. market only to dump it on the European, Asian and Latin American markets, knowingly exposing thousands, most of them children, to the live HIV virus. Government officials in France went to prison for allowing the drug to be distributed. The documents show that the FDA colluded with Bayer to cover-up the scandal and allowed the deadly drug to be distributed globally. No Bayer executives ever faced arrest or prosecution in the United States.

P. J. Watson, 'Accidental' Contamination of Vaccine with Live Avian Flu Virus Virtually Impossible. – Info Wars, 5 March 2009.

Лаборатория разослала вместо вакцины птичий грипп. По ошибке?

Diesel Forum, 11 марта 2009
https://diesel.elcat.kg/index.php?showtopic=1770950

Одна из австрийских лабораторий, поддерживающая тесное сотрудничество с фармакологическим концерном "Бакстер", оказалась в центре крупного международного скандала, расследованием обстоятельств которого сейчас занимаются правоохранительные органы четырех европейских государств, а также Всемирная организация здравоохранения и Европейского центра по контролю за массовыми заболеваниями. Об этом сообщили австрийские газеты.

Как выяснилось, по поручению концерна "Бакстер" лаборатория разослала в исследовательские центры Германии, Словении и Чехии препараты, содержащие чрезвычайно опасный вирус птичьего гриппа H5N1. В этих центрах предполагалось, в частности, испытать новую вакцину против птичьего гриппа, однако препарат оказался отнюдь не лекарственным, а совсем наоборот - крайне болезнетворным. Подвох вскрылся в одной из чешских лабораторий, которая расположена в городе Конаровице. Там от прививки погибли все подопытные животные, а персонал пришлось срочно госпитализировать и сажать на строжайший карантин.

По данным австрийского Министерства здравоохранения, непосредственной угрозе заразиться птичьим гриппом оказались подвергнуты в общей сложности порядка 40 медицинских работников в Австрии, Германии, Словении и Чехии. Более того, крайне опасный груз был разослан по почте в виде обычных бандеролей, а это значит, что персонал почтовых отделений тоже рисковал своим здоровьем при обработке и доставке посылок.

WDDTY
WHAT DOCTORS DON'T TELL YOU

Vaccines infected with deadly avian flu virus

WDDTY, 12 March 2009

https://web.archive.org/web/20090316004403/http://www.wddty.com/03363800370588615118/vaccines-infected-with-deadly-avian-flu-virus.html

A large consignment of seasonal flu vaccine, which was due to be circulated to 18 European countries, has been infected with deadly live avian flu virus. Had the contamination not been detected, the vaccines may have started an avian flu pandemic, killing hundreds of thousands of people.

The World Health Organization is carrying out investigations at the Austrian research facility of Baxter International, the pharmaceutical company, where the contamination happened. Baxter has confirmed that the consignment contained live H5N1 virus, which causes avian flu.

A researcher in the Czech Republic discovered the lethal contamination when laboratory ferrets that he had injected with the H3N2 flu vaccine suddenly died. The H5N1 virus becomes lethal as an injection only when it is mixed with H3N2, a process known as reassortment.

The WHO investigation team says it doesn't have evidence to suggest that Baxter had deliberately reassorted the two viruses, but "what remains unanswered are the circumstances surrounding the incident in the Baxter facility," a WHO official said.

Despite dire warnings from health officials, no avian flu pandemic has occurred as human-to-human infection hasn't happened. So far, several hundred people have died after catching the virus from poultry, although governments have warned that millions would die if people could infect each other.

Baxter is currently working on a new type of avian flu vaccine, called Celvapan, which is based on cell culture technology.

The technology, which is being developed at Baxter's research facility in the Czech Republic, by-passes the conventional process where a virus is incubated in chicken eggs. Instead, Baxter is working with the 'native' virus that does not need to be modified.

Last year the vaccine passed the first two phases of safety trials, and Baxter announced that "Celvapan combines innovative science and breakthrough production technology with the aim of protecting people against an H5N1 pandemic flu infection."

Helen Branswell

Se investigan las causas de la contaminación de vacunas de la gripe humana con el virus de la gripe aviar en Europa

Rebelion, 3 March 2009; Fuentes: The Star
Traducido por Manuel Talens
https://rebelion.org/se-investigan-las-causas-de-la-contaminacion-de-vacunas-de-la-gripe-humana-con-el-virus-de-la-gripe-aviar-en-europa/

Está en marcha una investigación para tratar de descubrir por qué el fabricante de vacunas Baxter International Inc. puso a punto «material vírico experimental» a partir de una cepa del virus de la gripe humana contaminada con el virus de la gripe aviar H5N1 y luego lo distribuyó a una compañía austríaca.

Dicha compañía, Avir Green Hills Biotechnology, diseminó luego el supuesto producto vírico H3N2 a subcontratistas en la República Checa, Eslovenia y Alemania. Funcionarios de esos cuatro países europeos están ahora investigando el incidente, mientras que la Organización Mundial de la Salud (OMS) y el Centro Europeo para la Prevención y el Control de las Enfermedades (CEPCE) supervisan de cerca dicha investigación.

Incluso si no parece que ninguna de las 36 o 37 personas expuestas al producto contaminado fuese infectada, el incidente ha sido descrito como un «grave error» por parte de Baxter, que está a punto de obtener la licencia para desarrollar una vacuna contra el H5N1. Dicha vacuna se fabrica en dependencias diferentes en la República Checa.

«En este caso particular… el caballo no se escapó del establo», dijo en Estocolmo el doctor Angus Nicoll, del CEPCE.

«Pero eso no significa que la OMS, la Comisión Europea y otros organismos no se lo tomen en serio como cualquiera lo haría en el caso de accidentes de laboratorio con patógenos peligrosos».

La distribución accidental de una combinación de los virus H5N1 y H3N2 vivos -si de verdad tuvo lugar- podría haber tenido consecuencias funestas. Nicoll dijo que los investigadores todavía no están seguros al 100 % de que la combinación contuviese virus H5N1 vivos. Pero dado que los hurones expuestos experimentalmente a la combinación murieron, probablemente fuese así.

El virus H5N1 no infecta a los seres humanos con facilidad, pero los virus H3N2 sí lo hacen. Son uno de los dos tipos de virus de la gripe A que cada año suelen infectar a los seres humanos.

Si una persona expuesta a la combinación hubiese sido infectada simultáneamente con el H5N1 y el H3N2, podría haber servido como incubadora de un virus híbrido capaz de transmitirse fácilmente entre los seres humanos. Este proceso combinatorio, denominado reagrupamiento [1], es una de las dos maneras con las que se crean los virus pandémicos.

Las investigaciones publicadas el verano pasado por científicos en centros usamericanos para el control de enfermedades encontraron que, en el laboratorio, los virus H5N1 y H3N2 se apareaban con facilidad. Aunque menos virulentos que el H5N1, varios de los virus resultantes parecían retener al menos una parte del poder letal de su peligroso progenitor.

La compañía Baxter International, cuya sede se encuentra en Deerfield (Illinois), ha admitido que la contaminación se debió a un error acaecido en sus dependencias de investigación en Orth-Donau (Austria).

Dichas dependencias habían sido contratadas por Avir Green Hills para fabricar lo que Baxter denomina «material vírico experimental», basado en virus H3N2 humanos.

Christopher Bona, director de comunicaciones biocientíficas globales en la compañía Baxter, declaró que el producto líquido vírico no era una vacuna y fue desarrollado únicamente para hacer pruebas. Desvió hacia Avir Green Hills cualquier pregunta sobre el objetivo de las pruebas, pero afirmó que el lote vírico se utilizó en animales de laboratorio y no estaba previsto para su uso en seres humanos.

Avir Green Hills comunicó por correo electrónico que recibió el material a finales de diciembre. Luego lo envió a los subcontratistas. El mensaje electrónico afirmaba que en todo momento el material fue almacenado y manipulado bajo excelentes condiciones de bioseguridad.

Las alarmas empezaron a sonar a principios de febrero cuando investigadores del subcontratista checo inocularon hurones con el material y los animales no tardaron en morir. Baxter supo del problema el 6 de febrero, dijo Bona desde Deerfield.

Los hurones son susceptibles a las cepas de la gripe humana, pero no mueren de tales infecciones. Una investigación preliminar encontró que el material estaba contaminado con el virus de la gripe H5N1, que es mortal para los hurones.

Nicoll dijo que la muerte de los hurones respalda la hipótesis de que el material producido por Baxter contenía virus H5N1 vivos.

Bona dijo que Baxter ha dilucidado la manera en que la contaminación tuvo lugar y ha tomado las medidas necesarias para asegurarse de que no vuelve a suceder. Añadió que las autoridades austriacas auditaron la labor investigativa de Baxter en Orth-Donau cuando surgió el problema y están satisfechas de las medidas que se han tomado.

Baxter es el único fabricante de vacunas de la gripe que trabaja con cepas naturales de dicho virus [2], considerado como más peligroso que los virus alterados y atenuados que utilizan otros fabricantes.

La compañía utiliza las denominadas «precauciones de grado BSL3» en todas sus dependencias de investigación sobre vacunas, afirmó Bona. Investigadores del Centro Usamericano para el Control de las Enfermedades (U.S. CDC) utilizan el grado BSL3 con biocontención cuando trabajan con virus H5N1, afirmó un portavoz de la agencia.

Expertos en reglamentos de bioseguridad están consternados ante los indicios de que en las dependencias de investigación de Baxter hayan podido mezclarse virus H3N2 humanos y H5N1 aviares, algo que bajo ningún concepto debería suceder, han afirmado algunos.

Por su parte, la compañía no está colaborando en el esclarecimiento de este caso.

«Lo sucedido en este procedimiento fue una combinación del proceso en sí mismo (y) de un error técnico y humano», afirmó Bona. Cuando le pidieron que diese más detalles respondió que, si lo hiciera, revelaría información confidencial sobre el proceso de producción de Baxter.

Añadió que cuando Baxter se dio cuenta de su error, colaboró con varias compañías en la destrucción del material contaminado y en la limpieza de sus dependencias. Y el personal expuesto al producto contaminado fue evaluado y supervisado por especialistas en enfermedades infecciosas. Asimismo, se les prescribió el fármaco antivírico oseltamivir (Tamiflu).

El error de Baxter recuerda un incidente de 2005 en el que un fabricante usamericano de equipos utilizados por los laboratorios para verificar sus capacidades de detección incluyó viales del virus H2N2 en varios miles de tales estuches de experto. El virus H2N2, que causó la pandemia de 1957, no ha circulado desde 1968 y se lo considera como un candidato de primer orden para la próxima pandemia.

Este error, descubierto en el Laboratorio Nacional de Microbiología de Canadá, puso en estado de alerta a las autoridades de todo el mundo para recuperar y destruir los viales del virus, que habían sido enviados a laboratorios de 18 países.

Jeff Sutherland

Vaccine contamined with Avian Flu virus

Frequency Foundation, 17 March 2009.
https://www.frequencyfoundation.com/2009/03/17/vaccine-contamined-with-avian-flu-virus/

Deerfield, IL-based Baxter International has confirmed that vaccine shipments sent to subcontractors in Czech Republic, Slovenia and Germany were contaminated with live H5N1 avian flu viruses. The contaminated product, which Baxter calls "experimental virus material," was a mix of H3N2 seasonal flu viruses and H5N1 viruses produced at the company's research facility in Orth-Donau. The problem was discovered when ferrets inoculated with the experimental mix died. Baxter was notified on February 6, but has kept quiet about the details surrounding the mix-up, the Canadian Press reports.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said. "But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

According to the Sun, Christopher Bona, said in an email that the release of the product was a result of a combination of "just the process itself, (and) technical and human error in this procedure" and the company has taken steps to make sure it doesn't happen again. The Canadian Press reports that Bona has said that the contaminated product was not a vaccine and was developed for testing in animals only. Austrian authorities have audited operations at the facility and are satisfied with the corrective actions taken. Baxter has also worked with the subcontractors to help them destroy the contaminated products and clean up their facilities. Staff exposed to the products were offered Tamiflu and assessed by infectious disease doctors, the company tells the Canadian Press.

While H5N1 doesn't easily infect humans, the H3N2 vaccine can. As the Sun points out, someone infected with both strains could serve as an incubator for reassortment, producing a hybrid virus able to transmit easily among people. But according to Andraghetti, there is no evidence reassortment occurred. "And we have no evidence of any increased transmissibility of the viruses that were involved in the experiment with the ferrets in the Czech Republic," she added.

European lab accidents raise biosecurity concerns

Reuters, 20 March 2009
https://www.reuters.com/article/idUSLJ556939

Geneva/Chicago, March 19 (Reuters) - Lab accidents involving bird flu and Ebola viruses have increased biosecurity fears in Europe, where public health experts say research on dangerous pathogens needs to be more strictly monitored.

A scientist in Germany last week pricked herself with a needle that was believed to be contaminated with a strain of the Ebola haemorrhagic virus with a mortality rate of around 90 percent. She is still under observation in hospital.

That accident added to public health concerns following the recent disclosure that deadly H5N1 bird flu virus samples were mixed with seasonal flu samples at a Baxter International

BAX.N
Contracted laboratory in Austria.

Health authorities and industry groups reviewing European lab safety standards concluded in a new report that scientists and managers needed to be better trained in ways to prevent, handle and report such incidents.

While stressing that research on viruses and pathogens is important for vaccine, drug and diagnostic development, the group Biosafety Europe said "it also represents a risk to the population in case those organisms may spread in the environment due to a laboratory accident, poor laboratory practices or intentional removal and subsequent release (terrorist attack)."

"Adequate technical and physical containment measures and best biosafety and biosecurity practices must be implemented in those facilities to prevent accidental or intentional release of dangerous pathogens," it said in the recommendations, published on www.biosafety-europe.eu/FinalConsiderations_PDFs.html

Security experts say viruses and other biological agents could be used as weapons, as occurred in 2001 in the United States when envelopes containing anthrax were sent to media outlets and U.S. lawmakers, kiling five people.

HUMAN ERROR

Baxter spokesman Chris Bona said the Illinois-based company learned in February about the H5N1 contamination, which was due to "a combination of process, technical and human error."

The flu virus samples were meant only for testing and not vaccine or product development, according to the spokesman, who said Baxter has "put corrective measures in place" after the accident but declined to give details "for proprietary reasons."

All 37 people exposed to the mixture at subcontractor sites in Germany, the Czech Republic and Slovenia, and at AVIR Greenhills Biotechnology, an Austrian company that bought the samples, tested negative for H5N1 bird flu, Bona said.

The World Health Organisation (WHO) fears that virus, which has killed 256 people since 2003, could trigger a deadly flu pandemic if it mutates and starts to spread more easily.

Biosafety Europe's project coordinator Kathrin Summermatter said that better training and more collaboration on safety standards could help reduce pathogen risks in European labs.

"We found that even though there are European guidelines concerning biosafety, the awareness, the implementation and the control was not the same in the different European countries," she told Reuters by email.

The group's report, compiled before the recent bird flu and Ebola accidents, said that Northern European countries disclosed more laboratory-acquired infections than other parts of Europe, "which in part may reflect reporting differences."

Summermatter said greater transparency about incidents that do occur was essential to help identify and reduce risks: "It is important to learn from the experience of other laboratories."

ANFRAGE

der Abgeordneten Dr. Belakowitsch-Jenewein
und weiterer Abgeordneter
an den Bundesminister für Gesundheit
betreffend Verschweigen eines schweren Laborzwischenfalls durch mit H5N1 verseuchten Grippeimpfstoff

Laut einem Bericht des Wissenschaftsforum Aviäre Influenza kam es *Meldungen tschechischer Medien zufolge in einem Labor der 70 km östlich der Hauptstadt Prag gelegenen Biotest Ltd. in Konarovice zu einem schwerwiegendem Zwischenfall durch mit hoch pathogenen H5N1 Viren kontaminiertem Impfstoff.*

Nach dem Wissenschaftsforum Aviäre Influenza (WAI) vorliegenden Informationen ereignete sich der Vorfall bereits am 6. Februar diesen Jahres. Der experimentelle Impfstoff war am 30.01.2009 von der Avir Green Hills Biotechnology GmbH im Auftrag des Wiener Pharma Herstellers Baxter an das Labor der Biotest Ltd. in Tschechien geliefert worden, wo dieser im Tierversuch an Frettchen getestet werden sollte.

Als im Rahmen der Tierversuche die Frettchen begannen Krankheitssymptome zu zeigen und einige der Tiere starben, wurde der aus Österreich gelieferte Impfstoff untersucht und eine Kontamination mit dem auch für Menschen gefährlichen Vogelgrippe-Erreger H5N1 festgestellt. 13 Labormitarbeitern der Biotest Ltd., welche über einen Zeitraum von annähernd einer Woche im Rahmen ihrer Arbeit Kontakt zu dem hoch pathogenen Erreger hatten, wurden präventiv antivirale Medikamente verabreicht. Zu einer Infektion des Laborpersonals kam es offenbar glücklicherweise nicht.

Bislang ungeklärt sind auch die Zusammenhänge des Laborzwischenfalls in Tschechien zu einer Meldung des Presse- und Informationsdienstes der Stadt Wien vom 11.2.2009 in welchem es heißt, dass im Wiener Otto-Wagner-Spital, Zitat: „18 MitarbeiterInnen eines externen Unternehmens ambulant behandelt [wurden], da vorerst nicht ausgeschlossen werden konnte, dass sie im Rahmen ihrer Arbeit mit einem Vogelgrippe-Erreger in Kontakt gekommen seien.

Nach Auffassung des WAI ergibt sich indes möglicherweise ein Kausalzusammenhang mit einer zeitgleich in Wien stattfindenden Phase I Studie eines H5N1-Lebendimpfstoffs des österreichischem

Pharmaherstellers Baxter, im Rahmen derer ein als „Nasenspray" konzipierter Vogelgrippeimpfstoff an Menschen getestet wird. Ob sich die Kontamination der Impfstoffe tatsächlich auf die an Menschen durchgeführte Phase I Studie in Wien ausgewirkte ist ungeklärt, würde aber plausibel zu erklären vermögen, warum am 11.02. – fünf Tage nach einem Laborzwischenfall durch kontaminierten Impfstoff in Tschechien – im österreichischem Wien 18 Menschen im Otto-Wagner-Spital präventiv gegen H5N1 behandelt werden müssen.

Obwohl der Laborzwischenfall mittlerweile als „Biological Hazard" vom EDIS („Emergency and Desaster Service") unter der Kennung BH-20090217-20552-CZE gelistet ist, sah sich Baxter bislang zu keiner öffentlichen Stellungnahme genötigt.

Das Wissenschaftsforum Aviäre Influenza fordert daher mit Nachdruck eine vollständige und detaillierte Offenlegung der Umstände, welche zur Kontamination eines Impfstoffs mit hoch pathogenen Erregern geführt haben.

Bereits im Jahre 2004 kam es zu einer Kontamination von Impfstoffen. Der Pharmahersteller Chiron (heute Teil der Schweizer Novartis AG) hatte damals 46 Millionen Dosen des Grippeimpfstoffs „Fluvirin" auf Grund bakterieller Verseuchung vernichten müssen.

Die unterfertigen Abgeordneten stellen daher an den Bundesminister für Gesundheit folgende

ANFRAGE

1. Seit wann sind Ihnen die oben angeführten Fakten bekannt?
2. Von wem wurden Ihnen die Informationen zu diesem Vorfall übermittelt?
3. Wurde dieser Vorfall im Ministerrat besprochen und wenn ja, wann, in welchem Umfang und mit welchem Ergebnis?
4. Welche Stelle in Österreich war die erste, die von diesem Vorfall erfahren hat und wie lange hat es gedauert, bis das Bundesministerium für Gesundheit davon erfahren hat?
5. Welche Maßnahmen wurden von Ihnen bislang eingeleitet?
6. Wer hat welche Maßnahmen beschlossen und welche Maßnahmen davon bislang bereits durchgeführt (Auflistung von Art und Zeitpunkt der ergriffenen Maßnahme)?
7. Aus welchen Gründen ist es bislang zu keiner Information der Öffentlichkeit gekommen?
8. Können Sie eine Bedrohung für die österreichische Bevölkerung ausschließen?
9. Wer sind die 18 Menschen, die im Otto-Wagner-Spital präventiv gegen H5N1 behandelt werden mussten und weshalb besteht bei diese 18 Personen der Verdacht, dass sie mit dem Vogelgrippe Erreger in Kontakt gekommen sind?
10. Von welchem „externen Unternehmen" sind diese 18 Patienten Mitarbeiter?
11. Wann wurde die Behandlung der 18 Personen begonnen und kann man mittlerweile mit einer 100%igen Sicherheit ausschließen, dass sich diese 18 Personen infiziert haben?
12. Wie viele in Tschechien tätige Personen sind mit dem Verdacht auf eine Infektion behandelt worden, wo sind diese Personen behandelt worden und in wie vielen Fällen hat sich der Verdacht bestätigt?
13. Was ist mit dem mit dem auch für Menschen gefährlichen Vogelgrippe-Erreger H5N1 kontaminierten Impfstoff passiert?
14. Welche Menge am Impfstoff war kontaminiert?
15. Kann ausgeschlossen werden, dass kontaminierter Impfstoff noch im Umlauf ist?
16. Hat es bislang bereits eine Stellungnahme von Baxter zu diesem Vorfall gegeben und wenn ja, mit welchem konkreten Inhalt?
17. Wenn nein, wann haben Sie Baxter um eine Stellungnahme ersucht und weshalb wurde diese bislang noch nicht abgegeben?
18. Wie sollen derartige Vorfälle künftig verhindert werden?

1437/J (XXIV. GP)
Verschweigen eines schweren Laborzwischenfalls durch mit H5N1 verseuchten Grippeimpfstoff

Dr. Dagmar Belakowitsch-Jenewein

**Written Questions to the Federal Government,
that is to say, to the members composing the XXIV.**

ANFRAGE - 1437/J (XXIV. GP) – 20 March 2009
https://web.archive.org/web/20090621120844/https://birdflu666.wordpress.com/2009/04/13/case-about-bird-flu/
https://web.archive.org/web/20090622124129/http://www.parlament.gv.at/PG/DE/XXIV/J/J_01437/pmh.shtml

QUESTIONS (submitted on 20.03.2009)

Silence over a serious laboratory incident involving flu vaccination material contaminated with H5N1 [Administrative details and a summary of the incident involving Baxter and Avir and the contaminated bird flu material follows in the German version]

The undersigned Members of Parliament therefore put to the Federal Minister for Health the following

1. At what time did you get to know about the above-stated facts?
2. Who informed you about this incident?
3. Has this incident been discussed by the Cabinet and if so, when, to what degree and with what result?
4. Which authority in Austria was the first to find out about this incident and how long did it take until the Federal Minister for Health found out about it?
5. What steps have been taken by you?
6. Who decided on which steps and which steps have been carried out so far (List of the measures taken and the date and time they were taken)?
7. What is the reason why no information has reached the general public so far?
8. Can you exclude a threat to the Austrian population?
9. Who are the 18 people, who were treated preventatively in the Otto-Wagner-Spital hospital against H5N1 and why was there reason that these 18 people had come into contact with the bird flu virus?
10. From which „external company“ are these 18 patient staff? [Note: Avir confirmed that the 18 staff treated in the Otto Wagner hospital for bird flu belonged to them in a press release issued after these questions were tabled]
11. When was the treatment of the 18 people started and can it in the meantime be excluded with a 100 per cent certainty that these 18 people have not been infected?
12. How many people in the Czech Republic have been treated for a possible infection, where were these people treated and in how many cases where they diagnosed to have the infection?
13. What has happened to the vaccine material contaminated bird flu H5N1 virus which is dangerous to people?
14. What quantity of the vaccine material was contaminated?
15. Can it be excluded that this contaminated vaccine material is still in circulation?
16. Has Baxter issued a statement to this incident, and if so, what is the content in detail?
17. If not, when did you request a statement from Baxter and why was has this statement not been issued until now?
18. How are incidents like this to be avoided in the future?

Eingelangt am 20.05.2009
Dieser Text wurde elektronisch übermittelt. Abweichungen vom Original sind möglich.

Frau, Präsidentin des Nationalrates
Maga. Barbara Prammer
Parlament, 1017 Wien

Sehr geehrte Frau Präsidentin!

Ich beantworte die an mich gerichtete schriftliche parlamentarische Anfrage Nr. 1437/J der Abgeordneten Dr. Belakowitsch-Jenewein und weiterer Abgeordneter nach den mir vorliegenden Informationen wie folgt:

Vorweg halte ich fest, dass aus datenschutzrechtlichen Gründen Firmennamen nicht zu nennen sind.

Frage 1:

Die von Ihnen vorgelegte Beschreibung eines Vorfalls bei dem angeblich ein „Grippeimpfstoff" mit Vogelgrippe-Virus (Influenza A/H5N1) kontaminiert wurde, trifft nur teilweise zu.

Nachvollziehbar ist Folgendes:

Bei einem Unternehmen mit Standort in Niederösterreich wurde ausschließlich für Forschungszwecke (und nicht zur Anwendung am Menschen!) bestimmtes Forschungsmaterial hergestellt. Auf Grund von Fehlern bei der Produktion wurde das Forschungsmaterial mit Vogelgrippe-Virus (Influenza A/H5N1) kontaminiert. Das Forschungsmaterial wurde im Rahmen eines Entwicklungsprojektes eines neuen Impfstoffes gewonnen. Dieses Material wurde dann im Rahmen des Forschungsprojektes zu einer Firma in der Tschechischen Republik transferiert. Dort wurde auf Grund eines Ergebnisses bei einem Tierversuch die Kontamination des übermittelten Forschungsmaterials mit Vogelgrippe-Virus (Influenza A/H5N1) bemerkt.

Dieser Vorfall wurde, von der in der Tschechischen Republik tätigen Firma, kommuniziert und in Folge österreichischen Gesundheitsbehörden gemeldet. Am 9. Februar 2009, 17.00 Uhr wurde das Bundesministerium für Gesundheit (BMG) von einer Kontamination eines für Forschungszwecke hergestellten Materials mit Vogelgrippe-Virus (Influenza A/H5N1) informiert.

Seitens der jeweils national zuständigen Gesundheitsbehörde wurden die notwendigen Erhebungen und Untersuchungen durchgeführt und Veranlassungen getroffen, um proaktiv eine allfällige Gefährdung von Mensch und Tier zu verhüten.

Zu den proaktiv getroffenen präventiven Maßnahmen gehörte die prophylaktische Einnahme eines Neuraminidasehemmers durch möglicherweise kontaminierte Personen, sowie deren medizinische Untersuchung in einem Wiener Spital. Es konnte sehr rasch festgestellt werden, dass es zu keiner Erkrankung gekommen ist.

Frage 2:
- Von der Landessanitätsdirektion Wien,
- Von den, aus datenschutzrechtlichen Gründen nicht zu nennenden, Firmen

Frage 3:
Der Vorfall wurde nicht im Ministerrat besprochen, da für die Öffentlichkeit keine Gefährdung gegeben war.

Frage 4:
Die Landessanitätsdirektion/Magistratsabteilung 15 - Gesundheitsdienst der Stadt Wien (nachfolgend immer LSD/MA 15 genannt) und das Bundesministerium für Gesundheit (nachfolgend immer mit BMG genannt) wurden jeweils am 9. Februar 2009 verständigt.

Frage 5:
Die LSD/MA 15 war, gemäß der bestehenden Gesetze, für die Betreuung der möglicherweise kontaminierten Personen zuständig und hat die notwendigen Schritte veranlasst. Die Maßnahmen wurden prophylaktisch durchgeführt. Die LSD/MA 15 hat ein Audit bei der involvierten Firma vorgenommen.
Das Bundesamt für Sicherheit im Gesundheitswesen, welches zum Wirkungsbereich des BMG gehört, hat die Inspektion der involvierten beiden österreichischen Firmen durchgeführt. Auf Grund der Inspektionsergebnisse wurden die erforderlichen Maßnahmen gesetzt, um einen neuerlichen Vorfall dieser Art zu vermeiden.
Nach Bekanntwerden des Vorfalls wurden unverzüglich alle Ein- und Ausfuhren von Influenzaerregern durch Weisung an die Grenzen und durch Information der beteiligten Firma unterbunden, da zu diesem Zeitpunkt eine aufrechte Bewilligung für innergemeinschaftliches Verbringen von erregerhältigem Material (für Influenzaviren H5N1) vorlag.
Die Labors der Firma wurden durch die Veterinärbehörde besichtigt. An dieser Besichtigung nahm auch ein Vertreter aus dem Humanmedizinbereich meines Ressorts teil.
Auf Grund der Ergebnisse der Laborinspektionen wurde die o. a. Weisung wieder aufgehoben.

Frage 6:
Wie in der Beantwortung der Frage 5 bereits ausgeführt - die Landessanitätsdirektion/ Magistratsabteilung 15 - Gesundheitsdienst der Stadt Wien und das Bundesministerium für Gesundheit.

Datum	**Aktion**
9. Februar 2009	Information des BMG und der LSD/MA 15 -
Laufend ab Meldung	Erhebungen zum Sachverhalt, Risikobeurteilung und Krisenmanagement durch die LSD/MA 15 und durch das BMG
9. Februar 2009	Untersuchung von potentiell betroffenen Firmenmitarbeitern in einem Wiener Spital; Überwachung der Personen, die potentiell mit dem kontaminierten Forschungsprodukt Kontakt hatten durch die LSD/MA 15
13. Februar 2009	Information des BMG durch LSD/MA 15 über das Ergebnis eines Audits bei der involvierten Firma
16. Februar 2009	Inspektion des niederösterreichischen Standortes der Firma im Auftrag des BMG
23. Februar 2009	Inspektion der Wiener Firma im Auftrag des BMG; Im Zusammenhang mit einer veterinärbehördlichen Bewilligung wurden die Labors der Firma durch die Veterinärbehörde besichtigt. An dieser Besichtigung nahm auch ein Vertreter aus dem Humanmedizinbereich des teil.
24. Februar 2009	Eine Besprechung des Falles erfolgte auch im Rahmen der Bundeskommission für Zoonosen.

Frage 7:
Es bestand und besteht kein Anlass, die Öffentlichkeit über die Kontamination eines für Forschungszwecke hergestellten Materials mit Vogelgrippe-Virus (Influenza A/H5N1) zu informieren. Für die Öffentlichkeit war keine Gefährdung gegeben.

Frage 8:
Ja

Frage 9:
Es darf als bekannt vorausgesetzt werden, dass personenbezogene Daten im Gesundheitsbereich nicht weiterzugeben sind. Alle 18 Personen sind Mitarbeiter der involvierten Unternehmen. Bei der Handhabung mit dem Forschungsmaterial wurden übliche Vorsichtsmaßnahmen und Schutzmaßnahmen beim Umgang mit biologischen Material ergriffen (z.B. Arbeiten im geschlossenen System oder mikrobiologische Sicherheitswerkbank, spezielle Räume über Schleuse zu betreten, …). Daher war eine Infektion mit dem involvierten Vogelgrippe-Virus (Influenza A/H5N1) nicht sehr wahrscheinlich.

Frage 10:
Auf die Vorschriften des Datenschutzes wird verwiesen.

Frage 11:
Die prophylaktische Behandlung der potentiell durch die Kontamination betroffenen Personen erfolgte bereits ab 7. Februar 2009. Am 9. Februar 2009 erfolgten medizinische Untersuchungen von, potentiell durch die Kontamination betroffene, Personen in einem Wiener Spital. Es konnten keine Hinweise für Erkrankungen mit dem Vogelgrippe-Virus (Influenza A/H5N1) festgestellt werden. Erkrankungen jener, von der potentiellen Kontamination mit dem involvierten Vogelgrippe - Virus (Influenza A/H5N1) betroffenen Personen können definitiv ausgeschlossen werden.

Frage 12:
Es gibt keine Zuständigkeit des BMG in der Tschechischen Republik. Nach Auskunft der tschechischen Behörden sind jedoch keine Erkrankungen durch das involvierte Vogelgrippe-Virus (Influenza A/H5N1) erfolgt.

Frage 13:
Es lag kein „Impfstoff“ vor, sondern ausschließlich für Forschungszwecke (und nicht zur Anwendung am Menschen!) bestimmtes Material. Das Material wurde kontrolliert vernichtet.

Fragen 14 und 15:
Das für Forschungszwecke bestimmtes Material - 72 kg waren als kontaminiert anzusehen - wurde in die Firma zurück geholt und kontrolliert vernichtet.

Fragen 16 und 17:
Die Firma hat eine Stellungnahme zum Vorfall abgegeben, aus der sowohl Fehlerursache als auch Fehlerbehebung hervorgehen. Maßnahmen zur Vermeidung derartiger Vorfälle wurden von der Firma in Absprache mit den zuständigen Gesundheitsbehörden getroffen.

Frage 18:
In Absprache mit den zuständigen Behörden wurden von der beteiligten Firma organisatorische und technische Maßnahmen gesetzt. Auch durch die Forcierung von Informationen und Schulungen speziell im veterinärmedizinischen Bereich werden weitere Bestrebungen erfolgen, derartige Vorfälle zu minimieren bzw. diese so weit wie möglich zu verhindern.

Der § 12a Tierseuchengesetz enthält Bestimmungen hinsichtlich des Umgangs mit Erregern und sieht eine Bewilligung für das Arbeiten mit infektiösen Tierseuchenerregern vor.
Angepasste Leitlinien für die Erteilung von solchen veterinärbehördlichen Bewilligungen für das Arbeiten mit Erregern von Tierseuchen sind weitgehend ausgearbeitet.

Diese Leitlinien beinhalten z.B.:

• die unverzügliche, auch schriftliche Informationspflicht für das Labor bei Zwischenfällen;

• die Verpflichtung zur Erstellung eines Krisenplans, welcher dem Ansuchen auf Bewilligung anzuschließen ist;

• die Verpflichtung, der Behörde jährlich einen Bericht über erfolgte Verbringungen von Erregern vorzulegen;

• die Verpflichtung, dass allfällige Verbringungen nur unter Einhaltung der Transportvorschriften und jedenfalls nur an ebenfalls bewilligte Einrichtungen erfolgen dürfen;

• die generelle Befristung der Bewilligung für das Arbeiten mit Tierseuchenerregern; das Verbot, dass Bewilligungen auf Nachfolgefirmen übertragen werden;

• die Verpflichtung, die Weitergabe von erregerhältigem Material ins Ausland erst nach Vorliegen einer schriftlichen Bestätigung der zuständigen Behörde des Empfangsstaates, dass erregerhältiges Material eingebracht werden darf, durchzuführen;

Weiters wurde mit dem Humanmedizinbereich vereinbart, veterinäre Bewilligungen für Arbeiten mit Zoonoseerregern (Erreger, welche zwischen Tier und Menschen übertragen werden können) erst dann zu erteilen, wenn die Laboranlagen gemeinsam besichtigt wurden und die Sicherheit für ein gefahrenfreies Arbeiten festgestellt wurde. Die gemeinsamen Besichtigungen vor Ort erfolgten bereits in diesem Sinn.

Mit freundlichen Grüßen
Alois Stöger diplômé
Bundesminister

WHO mulls stricter transport of bio products

Financial Times, 16 March 2009, 22:10;
https://web.archive.org/web/20110517124809/http://www.ft.com/cms/s/0/d7a3e3d6-1237-11de-b816-0000779fd2ac.html?nclick_check=1

Public health officials are studying the need for tighter controls on the transport of biological products after Baxter, the US pharmaceutical company, inadvertently supplied samples of the H5N1 bird flu virus to a series of European laboratories.

Specialists from the World Health Organisation and the European Centre for Disease Prevention and Control are monitoring the case at a time of growing concern that existing international rules to minimise the risks of the spread of pathogens are too weak.

Their scrutiny follows an incident that recently came to light when samples of H5N1 from Baxter's Austrian labs contaminated batches of the less harmful H3N2 seasonal flu virus that it was supplying under a commercial contract to a customer, Avir Greenhills Biotechnology.

A combination of H3N2, which is highly transmissable between humans, and H5N1, which has killed hundreds of millions of chickens and other animals in recent years, could potentially lead to a mutated virus that forms the basis of a new human pandemic threatening millions of lives, according to scientists.

Baxter stressed that the H3N2 strain had been made "replication defective", and was handled in tightly controlled laboratories purely for experiments, so there was little chance it could have led to an outbreak threatening humans. It also stressed that all staff potentially exposed were tested and given antiviral treatment to prevent any infection.

Baxter was forced to suspend production last year of Heparin, a blood thinner, after contamination during manufacturing of the primary ingredient in China triggered health alerts in the US, where regulators say it may have contributed to patient deaths. Baxter has refuted the FDA's claim.

Baxter said the H5N1 samples were provided for its own research into a pandemic vaccine it is developing, and were from a variant of the virus identified in Vietnam and provided to the company by the US Centers for Disease Control in Atlanta.

"The material was handled appropriately in all steps of the process in the right conditions," said Chris Bona, a Baxter spokesman. "The experimental material was produced exclusively for laboratory testing, was not used for product production and was not for use in humans."

It somehow mixed with H3N2 before distribution last December to Avir, and the more potent virus was detected by a subcontractor in the Czech republic last month after it rapidly killed ferrets exposed to the viruses. Avir had also sent samples to Slovenia and Germany.

Mr Bona stressed that Baxter had since taken "corrective preventative actions" and its procedures had been approved by the Austrian authorities.

The incident comes just after the conclusion of an EU-funded project on biosafety highlighted the need for improvement to national regulatory frameworks for biosafety and laboratory biosecurity.

The Bovine

Avian-flu-virus contamination found in flu vaccine – just another reason not to get vaccinated, or the tip of an iceberg:

Create the perfect storm of a pandemic to ram through "Food Safety" legislation giving control over all agriculture to bio-tech firms like Monsanto & their proxies.

The Bovine, 26 March 2009
https://thebovine.wordpress.com/2009/03/26/avian-flu-virus-contamination-found-in-flu-vaccine-just-another-reason-not-to-get-vaccinated-or-the-tip-of-an-iceberg-create-the-perfect-storm-of-a-pandemic-to-ram-through-food-safety-legisla/

"Were Tainted Vaccines a Conspiracy to Provoke a Pandemic?

Czech newspapers are questioning whether the shocking discovery of vaccines contaminated with the deadly avian flu virus - distributed to 18 countries by the American company Baxter – were part of a conspiracy to provoke a pandemic.

Because of laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

Baxter flu vaccines contaminated with H5N1 (the human form of avian flu) were received by labs in the Czech Republic, Germany and Slovenia. Initially, Baxter refused to reveal how the vaccines were contaminated with H5N1, invoking "trade secrets." After increased pressure, they then claimed that pure H5N1 batches were sent by accident.

But in the Czech Republic, reporters are investigating whether the contamination was part of a deliberate attempt to start a pandemic.

The fact that Baxter mixed the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses may be the smoking gun. The H5N1 virus on its own has killed hundreds of people, but it is less airborne. However, when combined with seasonal flu viruses, which are more easily spread, the effect could be a potent, airborne, deadly biological weapon."

And here is part of Mercola's commentary:

"Last month vaccine maker Baxter International sent a mix of flu vaccine and unlabelled H5N1 virus (the human form of bird flu) to an Austrian research company. Expecting the shipment to contain only flu vaccine, the Austrian company then sent portions of the contaminated product to the Czech Republic, Slovenia and Germany.

It was only when researchers at a Czech Republic laboratory injected ferrets with the vaccine, and they unexpectedly died, that the contamination mistake was discovered.

But is "mistake" really an accurate term to describe this?

If this batch of live bird flu and seasonal flu viruses had reached the public, it could have resulted in dire consequences. Even though H5N1 doesn't easily infect people, the flu virus does. So if people were exposed to both of these viruses, they would have become hosts for the combined viruses, and would have become highly contagious and able to transmit the deadly bird flu virus to others.

There is actually a name for this mixing of viruses; it's called "reassortment," and even The Canadian Press has pointed out that it is one of two ways pandemic viruses are created.

A spokesman for Baxter said the virus material was supposed to contain a seasonal flu virus and was contaminated after "human error."

Yet, other sources say Baxter International adheres to something called BSL3 (Biosafety Level 3). This strict set of laboratory safety protocols is in place to prevent the cross-contamination of materials, and according to some may have made it virtually impossible for the live bird flu virus to contaminate a flu vaccine by accident.

Czech newspapers are among those questioning whether this was a deliberate act to start a pandemic, and there's even been talk of plans to use the vaccines to carry out a form of population control.

But then there's the issue of motive. Would Baxter have had any reason to carry out such a malicious and deadly scheme?

Well, if a bird flu pandemic suddenly broke out, the demand for bird flu vaccines would certainly skyrocket … and the profits from such a mass vaccination program would be astronomical.

And here's some more commentary on related matters from a variety of sources:

There are a lot of questions that come up from this since it is related to the "food safety" bills and their need to make a case for NAIS, that it is urgent to track "animal diseases" – avian flu being one people are scared of.

But the background noise is that fear of avian flu (which was never as dangerous as it was made out to be) is now being used to wipe out small farmers poultry stocks across Asia and then to force the substitution of genetically engineered poultry (patented, privatized) that is said to be "avian flu-ready." Are they looking to create outbreaks in the EU and perhaps here to do the same and create an emergency to help pass the bills?

Flu News Network ~ Flu news, Information, Prepardness

European labs discover flu vaccines contaminated

Cottontop, 28 March 2009
https://cottontopssandbox.wordpress.com/2009/03/28/european-labs-discover-flu-vaccines-contaminated/

If "accidental" contamination is virtually impossible, then intentional contamination likely.

> "Globally-practiced protocols and regulatory schemes governing the handling of pathogens in the research, development, manufacture and transport of vaccines make it virtually impossible for U.S. flu vaccine producer Baxter to accidentally contaminate and export vaccines containing live H5NI (avian) viruses. The implication, then, is that the inclusion of "bird flu" was intentional and shipped all over the world to trigger a pandemic."

Baxter's facility in Austria makes annual flu vaccines but was also developing a human H5N1 vaccine for which a license was expected in the near future. Researchers claim the "serious error" could not have been accidental since it is virtually impossible for live avian flu virus to find its way into a vaccine by "accident".

As health ranger Mike Adams of NaturalNews.com points out, "The shocking answer is that this couldn't have been an accident. Why? Because Baxter International adheres to something called BSL3 (biosafety level 3)-a set of laboratory safety protocols that prevent the cross-contamination of materials. Laboratory personnel have specific training in handling pathogenic and potentially lethal agents and are supervised by competent scientists who are experienced in working with these agents. …All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate protective clothing and equipment. The laboratory has special engineering and design features."

Under the BSL3 code of conduct, it is impossible for live avian flu viruses to contaminate production vaccine materials that are shipped to vendors throughout the world.

This leaves only two possibilities:

1. Baxter isn't following BSL3 safety guidelines or is so sloppy in following them that it can make monumental mistakes that threaten the safety of the entire human race. And if that's the case, then why are we injecting our children with vaccines made from Baxter's materials?

2. A rogue employee (or an evil plot from the top management) is present at Baxter, whereby live avian flu viruses were intentionally placed into the vaccine materials in the hope that such materials might be injected into humans and set off a global bird flu pandemic.

Spreading bird flu would create an instantaneous surge of demand for bird flu vaccines. The profits that vaccine companies such as Baxter International could reap out of such a panic are astronomical.

"Baxter is acting a whole lot like a biological terrorism organization these days, sending deadly viral samples around the world. If you mail an envelope full of anthrax to your senator, you get arrested as a terrorist. So why is Baxter-which mailed samples of a far more deadly viral strain to labs around the world-getting away with saying, essentially, 'Oops?'" Adams asked.

While public health officials at the time appeared concerned, claiming to investigate the cause for the contamination of flu vaccines distributed to 18 countries, as of March 21, 2009, the World Health Organization (WHO) has not released a statement on the Baxter incident. Instead WHO is moving forward with stockpiling worldwide H5N1 containing vaccines in preparation for a global pandemic, the ingredients of which are "proprietary".

It should also be noted that the federal regulators in the U.S. and the affected countries have not commented on the incident nor is there any evidence that they plan to sanction Baxter for its serious breach in security with regard to the handling of such tightly controlled pathogenic agents.

Cassandra Willyard

Biosafety bungle leads to bird flu contamination

Nature Medicine, 1 April 2009, Vol. 15, N 4: 349
doi: 10.1038/nm0409-349a. PMID: 19349992.

In February, a group of experimental ferrets at a research facility in the Czech Republic fell ill. The ferrets had recently been injected with a culture containing what was believed to be a straight shot of the seasonal influenza virus, but their symptoms were severe and wholly unexpected. Researchers later determined that they were suffering from avian influenza; the seasonal flu culture had been contaminated with the deadly virus H5N1.

The flu sample, which came from an Austrian laboratory owned by Baxter International, ended up in at least three other labs in Austria, Germany and Slovenia. Although no one has fallen ill as a result of the mix-up, experts say the incident raises biosafety concerns and highlights the need for better quality control.

"I think it points to major problems," says David Topham, a microbiologist at the University of Rochester Medical Center and co-director of the New York Influenza Center of Excellence. Although contamination can happen easily, he says, there should be sufficient safety measures in place to prevent it.

Christopher Bona, a spokesperson for the Illinois-based Baxter, says it is "highly unlikely" that anyone was exposed to the avian flu virus. He adds that the contamination was due to "a combination of process, technical and human error," but that the problem has since been corrected. Bona refused to give specific details about how the accident occurred, noting that Baxter's processes are proprietary.

Although the World Health Organization and the European Centre for Disease Prevention and Control are aware of the incident, the Austrian Ministry of Health has jurisdiction over Baxter's lab in Orth-Donau. The ministry audited the lab after the accident. "Nothing alarming was found," says Sigrid Rosenberger, a spokesperson for the ministry.

Baxter's Austrian lab had sent the flu culture to the Vienna-based Avir Green Hills Biotechnology, which is developing a live attenuated influenza vaccine. Avir workers handled the contaminated material in Vienna, but they also sent the culture to three subcontractors, including the facility in the Czech Republic. Topham says employees working at these labs would have had the greatest risk of contracting avian influenza. But, he adds, the risk is minimal unless the virus is introduced directly into the respiratory tract, a situation that would be unlikely if the lab workers followed standard biosafety procedures.

According to Avir, all potentially exposed employees have been examined and treated with antiviral medicines. Furthermore, the contaminated product has been destroyed, and all of the labs have been sanitized. "At no time was there any danger to the population or the environment," says Birgit Kofler-Bettschart, a spokesperson for the company.

Still, the incident has left many concerned. It highlights "a potential hole in the regulation of the early stages of vaccine research," says Gregory Härtl, a spokesperson at the World Health Organization.

"The mere fact that this could happen," says Albert Osterhaus, head of the virology department at Erasmus University Medical Center in Rotterdam, "indicates that there is something wrong." Osterhaus would like to see Baxter help others learn from its mistake: "when you see [...] holes in the system, I think it's important to share that with the people that are working in this particular area." It's like the aftermath of a plane crash, he says. "It's always very important to see what went wrong."

Jane Burgermeister, an Austrian investigative reporter, filed criminal charges in April against Baxter AG and Avir Green Hills Biotechnology of Austria for producing contaminated bird flu vaccine, alleging this was a deliberate act to cause and profit from a pandemic

Criminal charges against
Baxter AG,
Baxter International and
Avir Green Hill Biotechnology AG,

For developing, manufacturing, disseminating, and releasing a biological weapon of mass destruction, on Austrian soil between December 2008 and February 2009; With the intention of causing a global bird flu pandemic virus and of intending to profit from that same pandemic, in an act that Violates Laws on International Organised Crime and Genocide.

Charges filed against Baxter and Avir
Charges filed with the 1st part translated into English

Overview

Submitted on:
Wednesday, 8th April 2009,
Vienna State Prosecutor's Office, Landesgerichtstrasse 11, 1080 Vienna

CONTENTS

A. Summary of the criminal charges brought and of the grounds for these charges
B. Statement of Facts: Timeline and relevant background information
C. Relevant Laws

A. Summary of the criminal charges brought and of the ground for these charges.

I am a citizen of Austria and live in Vienna, and would like to file criminal charges against the corporate entities of

Avir Green Hills Biotechnology, headquartered in Vienna, Währing, and
Baxter AG, headquartered in Vienna, the Austrian subsidiary of the pharmaceutical company Baxter International, headquartered in Deerfield, IL, USA, and
Baxter International,
for endangering my life and health as well as the lives and health of the people in the city of Vienna, in Austria and in the surrounding countries.
Avir and Baxter unlawfully, wilfully and knowingly, in the period between December 2008 and February 2009, employed manipulative and deceptive devices and contrivances in violation of national and international laws on the manufacturing, possession, release and dissemination of biological weapons of mass destruction and on organised crime, to manufacture and distribute a biological agent that is classified as a bioweapon among the population.

First, Baxter manufactured an influenza material which was contaminated with a bird flu virus in its biomedical research laboratories in Orth on the Danube in December 2008.

Baxter uses BSL 3 (Biosafety Level 3) precautions in its laboratories, a system for the safe-handling of toxic substances, which makes an accidental contamination of ordinary flu material with the dangerous bird flu virus virtually impossible.

The contaminated vaccine material contained a mixture of a seasonabl H3N2 human influenza virus and the deadly H5N1 virus. By adding a virus of the type H5N1 to an ordinary flu virus of the type H3N2, Baxter produced a highly dangerous biological weapon with a 63 per cent mortality rate.

The H5N1 virus is restricted in its human-to-human transmissibility, especially because it is less airborne.

However, when it is combined with seasonal flu viruses, which are airborne and easily spread,
A deadly virus of this kind could spread around the world in a short time and infect millions and even billions of people.

Second, Baxter distributed via Avir a number of these contaminated vaccines using false concealment and a false label to 16 laboratories in Austria and in other countries at the end of January/beginning of February, potentially infecting at least 36-37 laboratory staff, who had had to be treated preventively for bird flu and ordinary flu in hospital.

On February 9th - on the very same day as 18 employees of Avir were given preventative treatment for the bird flu in the Otto Wagner Hospital in Vienna - AFP reported that Panasonic Japan intended to bring back to Japan the families of many of its staff working around the world because of the threat of a bird flu pandemic.

"Panasonic to fly home workers' families over bird flu fears

Feb 9, 2009

TOKYO (AFP) - Panasonic Corp. has ordered Japanese employees in some foreign countries to send their families home to Japan in preparation for a possible bird flu pandemic, a spokesman said Tuesday."
The firm decided to take the rare measure "well ahead of possible confusion at the outbreak of a global pandemic," he said.

Eight people have contracted the H5N1 bird flu virus in China alone this year - five of whom died.

"The bird flu cases reported so far are infections from bird to human, but once an infection between human beings is reported, things can get chaotic with many other companies trying to bring back their employees," Kadota said.

"We wanted to take action early before it gets difficult to book flight tickets," he said."

Furthermore, I contend that Avir and Baxter planned to profit from their triggering a bird flu pandemic by sealing a contract in 2006 with the Austrian Health Ministry, led by then Health Minister Maria Rauch-Kallat, to supply 16 million vaccine shots in the event of a bird flu pandemic being declared.

In addition, I maintain that this ‚laboratory incident" shows that national and international authorities are not able to fulfil their obligations to ensure the safety of the Austrian people. On the contrary, I maintain that the authorities are involved in trying to cover up this event.

If a pharmaceutical company can breach laws - and almost trigger a bird flu pandemic, which could harm 99 per cent of the world's population - without being made accountable for it in any way, then there is, de facto, no rule of law on Austrian territory.

As a result of the failure of the authorities to take action, those persons who were responsible for distributing the deadly pandemic virus are still sitting in the same positions in Baxter and Avir, and another such dangerous incident could happen anytime.

Moreover, I maintain that the specific production system which Baxter has developed with help of US government bodies for producing a human vaccination to the bird flu - namely, the use of 1,200 liter bioreactors and vero cell technology - could meet the technical criteria to be classified as a secret dual purpose large-scale bioweapon production facility in as far as the production process would allow a huge amount of contaminated vaccine material to be produced rapidly.

If contaminated material were added to the 1,200 liter bioreactors, it would replicate and infect the entire batch of vaccine material in the 1,200 liter tank.

Contaminated material could be distributed among sections of the population using false labels and secretly marked batches and so infect millions of people. There is evidence that the Spanish Flu pandemic of 1918-1919 was started after US soldiers were given contaminated inoculations.

I maintain that such a de facto covert dual purpose bioweapon production and delivery system could only be established on Austrian soil with the knowledge and support of persons in the highest offices in the Austrian Health Ministry and other Ministries and authorities who issued licences, permits and contracts without adequate controls.

Also, I contend the establishment and now use of a bioweapon production facility in Austria could only happen with the knowledge and support of key people in the media.

The general public has a right to be informed about this episode.
Many Austrians, however, have heard nothing at all about this incident because there has been so little coverage of it in the media.

They don't know that a vaccination, which the government will recommend everyone to take in the event of a bird flu pandemic and which has been pre-ordered in huge quantities using Austrian people's own tax money, is to be manufactured by the very same company that was responsible for almost triggering a bird flu pandemic this winter in the first place, namely Baxter.

The way vaccine material was contaminated with bird flu raises the question of whether Austrians can be sure that any vaccinations they are given have been adequately tested. Even today we don't know precisely what was in the contaminated vaccine material, which Baxter sent out to 16 laboratories in Austria and abroad.

We don't know which type of virus was in the contaminated material, if the virus was bio technically altered, and if so, what modifications were made. Every safeguard and control not only in Baxter and in Avir but also in the authorities have failed.

We can't even be sure what is in Baxter's ordinary flu vaccine shots if these are produced with equally few controls and checks.

Whenever a number of people in various organisations act in concert to carry out a criminal plan and to cover up their tracks afterwards, then this activity falls under the category of organised crime. I maintain that this ‚laboratory incident" and the subsequent cover up by the authorities and media has all the elements of international organised crime.

If millions of Austrians were to die as a result of a pandemic virus and/or contaminated inoculations, then their assets, their savings, their houses, apartments, farms and companies would be easy to acquire by a crime syndicate that has infiltrated and annexed key government offices. I, therefore, claim that the motivation for releasing this pandemic virus is one of classic robbery; if one arm of the international crime syndicate, after installing a covert bioweapon facility, releases a global pandemic virus, then the other financial arm of this same international crime syndicate can rob the assets of the victims around the globe as well as get greater control of the natural assets of any country, including water and agricultural land, natural assets that are increasingly valuable as global warming bites.

Avir Green Hill Biotechnolgy AG is a biopharmaceutical company, headquartered in Vienna, Währing.

As a resident of Vienna, Währing, I note that some of the violations that could have sparked a global bird flu pandemic occurred on the premises of Avir in the Gersthoferstr. 29-31, Vienna, Währing, between December 2008 and February 2009.

A total of 18 laboratory staff belonging to Avir had to undergo preventative treatment for the bird flu and ordinary flu at the Otto Wagner Hospital in Vienna on February, 9th, 2009, because of their exposure as part of their work to the highly pathogenic bird flu virus.

This indicates that, in the opinion of medical experts, there was a risk that the staff of Avir had contracted bird flu.

That means that the 18 staff could have, unknowingly, acted as carriers of a pandemic virus into the population of a densely built up Vienna city district and in winter time.

It needs to be stressed that the bird flu virus was developed in US military laboratories from 1995 onwards by researchers who reconstructed the genetic code of the Spanish Flu pandemic virus of 1918-1919.

According to a report in "Der Spiegel" from 05.10.2005 (US-Forscher beleben altes Killervirus von Markus Becker /US researchers resurrect old killer virus) the bird flu virus was reconstructed by Jeffrey K Taubenberger from the Armed Forces Institute of Pathology in Washington using lung tissue retrieved from victims of Spanish Flu from 1918-1919, which yielded pieces of the virus's genes.

‚Um das vor acht Jahrzehnten verschwundene Virus der Spanischen Grippe wieder zum Leben zu erwecken, entnahm Taubenbergers Team mehreren Leichen Gewebeproben, unter anderem einer Frau, die 1918 im Dauerfrostboden von Alaska beerdigt worden war. Zusätzlich verwendeten sie in Formalin konserviertes Lungengewebe von anderen Opfern der Spanischen Grippe.

In einem komplizierten Verfahren gelang es den Wissenschaftlern, den genetischen Code des extrem aggressiven H1N1-Virus zu identifizieren und es im Labor zu reproduzieren. Die Mediziner stellten mit dem genetischen Code virusartige Genstränge her, sogenannte Plasmide. Diese wiederum wurden menschlichen Nierenzellen eingepflanzt. ,

So, using the argument that they need to find an antidote to the lethal bird flu virus, researchers have resurrected this lethal bird flu virus and created the danger in the first place.

‚Reviving the Spanish Flu virus is a recipe for a catastrophe. It could put any attack using anthrax or the plague in the shade," said Jan van Aken, head of the German section of the Sunshine Project.

In the summer of 2008, US researchers found that this newly reconstructed lethal bird flu virus could be mixed with ordinary human flu virus in laboratory conditions and so, in theory, could acquire easy human-to-human transmissibility.

It was precisely this very virus mix of a lethal H5N1 bird flu virus and an ordinary human flu H3N2 virus that Baxter manufactured in its laboratory in Orth/Donau in December 2008, and then distributed via Avir to 16 laboratories in Austria and abroad employing fraudulent misrepresentation.

The Canadian Press explains the issue:

‚While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people."

According to media reports, Dr Rebecca Carley maintained in March 2009 that this was a deliberate attempt to start a pandemic.

‚Basically, they're trying to cause the pandemic. They have already stockpiled at least 250 million doses of the bird flu vaccine. The shelf life of that vaccine has a certain amount of time by which they'll have to throw it in the garbage. So they have to start the pandemic so that they can give the vaccines, which will then cause the bird flu pandemic...In fact, this is an associated press article that says that our government is reluctant to give bird flu vaccine to some of the rogue nations for fear they will use the vaccine as biological warfare. So when you actually look at what's out there, folks, it becomes crystal clear. This is genocide. This is population reduction. And it's happening right now."

‚Well, let me also state that this is very intentional because the H5N1 bird flu virus is not actually able to be picked up by humans in a regular scenario. So by putting it with a regular human flu, they're intentionally causing it to create a hybrid virus. And this is how they're going to make the bird flu virus be contracted by the people because it's very virulent. And basically, the scenario that it creates is very disturbing. You actually bleed out into your lungs and suffocate on your own blood."

The managers of Baxter and Avir are responsible for ensuring that biosecurity regulations are implemented.

The management team of Avir is listed as Thomas Muster (CEO, CSO), Michael Tscheppe (CFO), Reinhard Zickler (COO), Andrej Egorov (Vice President Research), Rosemarie Dick-Gudenus (Vice President Development), Joachim Seipelt (Vice President Cooperations). On the Supervisory Board of Avir are Herbert Hild, Nikolaus Zacherl, Christian Mitteregger, and Gregor Medinger,

The Board of Directors and CEOs of Baxter International Inc are listed on the company website at http://www.baxter.com/about_baxter/company_profile/company_leadership/index.html.

According to a press release of 2008, MD Dr Hartmut Ehrlich, is the on the board of Baxter AG, Vice President, Global Research & Development Baxter BioScience as well as CEO of Baxter Innovations GmbH. Mag. Markus Reinhard, is on the board of Baxter AG, company spokesperson, Vice President for Operations Support and Human Resources at Baxter BioScience Europe and Global Research & Development as well as CEO of Baxter Innovations GmbH.

Claims against Baxter

Specifically, I assert that a person or persons in Baxter, unlawfully, wilfully and knowingly, manufactured and distributed a deadly pandemic virus

a) by providing logistical help, support and authorisation for the manufacturing of a pandemic virus in Baxter's research laboratory in Orth/Donau in December 2008, specifically, by injecting the live bird flu H5N1 virus into human flu material, and in a large quantity; and

b) by employing devices, schemes and artifices to subvert the Biosafety Level 3 regulations in place at the laboratory in Orth/Donau in order to get that same live bird flu pandemic virus, undetected, without being radiated, out of the high biosecurity facilities in January 2009; and

c) by sending the live bird flu virus material through the post or by a courier to the premises of Avir by fraudulently concealing the true nature of the material from the carrier; and

d) by falsely misrepresenting the dangerous live bird flu pandemic flu material as an ordinary vaccine material by employing the contrivance of affixing a label that failed to disclose the true nature of content to outside laboratory staff, who, on the basis of that information, then handled the live bird flu pandemic in such a way that increased the risk of their exposure to the disease-producing biological virus, and so that they had to be given preventative treatment against the bird flu and ordinary flu in the Otto Wagner Hospital in Vienna on February 9th; and

e) by instructing their accomplice or accomplices at Avir to send on January 31st, by employing fraudulent concealment, the live bird flu pandemic material to 16 other laboratories in Austria and abroad, including to BioTest in the Czech Republic. Staff at BioTest tested the vaccine material on ferrets, which then died. The material delivered by Avir was tested and the presence of the dangerous live H5N1 bird flu virus detected. 13 members of BioTest staff who had contact with the virus for a almost a week as part of their work were treated preventatively for the bird flu; and

f) for allowing those 13 staff belonging to BioTest to be examined in the capital 400 km away when they should have been examined in a medical centre closer to home; and

g) for trying to cover up their role in the incident; Baxter has so far not issued any statement or given a full and detailed account of how the material came to be contaminated; and

h) for seeking to profit from any bird flu pandemic they engineered by positioning themselves to produce at short notice 16 million "vaccination" shots by sealing contracts in advance in 2006 with the Austrian Health Ministry, led at that time by Health Minister Maria Rauch-Kallat; and

i) for engaging in acts and practices to hinder scrutiny of their actions, also by employing the artifice of filing charges against themselves, thereby misusing a provision in the law whose overwhelming intent is to investigate a crime in order to escape just such an investigation.

Claims against Avir

I assert, specifically, a person or persons in the management/and or in other positions in Avir, unlawfully, wilfully and knowingly, distributed a deadly pandemic virus

a) by providing logistics, support and authorisation for the taking into custody of a package from Baxter with a live bird flu pandemic flu virus at their premises in Vienna Währing at the end of December 2008; and

b) by misleading the rest of the staff at Avir as to the true facts of the situation by the continued false misrepresentation of the nature of the pandemic virus material and so increasing the likelihood of that the staff would expose themselves to and be infected by the live bird flu material. Eighteen

staff belonging to Avir had to be treated preventatively for the bird flu in the Otto Wagner Hospital in Vienna on February 9th because of the risk that they had come in contact with the bird flu and human flu virus as part of their work, according to a press release.

c) by subverting biosafety regulations in place designed to screen and control incoming packages to get the contaminated material undetected out of Avir's premises at the end of January.

d) by sending the live bird flu pandemic material to 16 laboratories in Austria and abroad through the post or other courier services using false concealment on January 30th, 2009; and

e) by falsely misrepresenting the live bird flu pandemic flu material as a routine, non-threatening human flu vaccination material to the staff of BioTest and other outside laboratories with the object of misleading them into thinking there was no danger to their life or health, and so tricking them into performing actions that increased the risk of their exposure and infection by the disease-producing microorganisms. Thirteen staff belonging to BioTest were given preventative treatment on February 6th because of the risk that they had been infected by bird flu as part of their work; and

f) for trying to cover up their role in the incident; and

g) for positioning themselves to profit from the triggering of any pandemic through contracts with Baxter and other research laboratories.

In the light of the fact that so little information about the incident has been released to the general public, I have had to reconstruct the timeline to this laboratory incident from media sources.

According to a report, the authorities gave Baxter a green light to continue their operations after carrying out an inspection on February 16th.

Until now none of the four main parties in Austria have issued a statement on the incident.

According to the website of the Austrian Parliament, written questions were tabled to the Minister of Health by several members of parliament on March 20th.

The questions "Silence over a serious laboratory incident involving flu vaccination material contaminated with H5N1" tabled by Member of Parliament were not answered as of April 6th 2009.

One question is: "Can you rule out a threat to the Austrian population?"

Lawsuit Against Manufacturers of the Avian Flu Virus Vaccine

Check the Evidence, 28 June 2009
https://www.checktheevidence.com/wordpress/2009/06/28/old-news-4571/

State of the Nation

Jane Burgermeister

Charges filed against Baxter and Avir

State of the Nation // Birdflu666. – 13 April 2009
https://stateofthenation.co/?p=70631
https://web.archive.org/web/20090429014808/https://birdflu666.wordpress.com/2009/04/13/4/

I have filed criminal charges in Austria against Baxter and Avir Green Hills Biotechnology for producing and distributing contaminated bird flu vaccine material this winter, alleging that this was a deliberate act to cause a pandemic, and also to profit from that pandemic.

Avir and Baxter AG are headquartered inside the Vienna City limits, where I live, and so fall within the jurisdiction of the Vienna City Prosecutor.

In the paperwork I filed with the Vienna City Courthouse on Wednesday, April 8th, 2009, after consulting lawyers, I present evidence of intent to cause harm by Baxter and Avir, citing, among other things, the fact that Baxter uses Biosafety Level 3 regulations to prevent just such a contamination of ordinary flu with the bird flu virus.

Also, I suggest that there are reasonable grounds for believing that Baxter is part of a secret bioweapons programme and that there are plans to release weaponised bird flu on the world's population soon.

Furthermore, I present evidence to support the notion that Baxter is a smaller entity operating within a bigger aggregate of entities that belong to an international organised crime group, which I maintain can be identified with the group known informally as "The Illuminati".

I allege there is evidence the US "Illuminati"-controlled government plans to release the bird flu on the US population in the near future, citing bird flu drills, FEMA camps, mass graves among other facts.

Flowing from their obligations as a signatory to the UN Convention for the Punishment and Prevention of Genocide, I argue that Austrian courts are bound by law to prosecute any individuals or organisations when there is reasonable proof that they are involved in planning any genocide, including US officials.

In an era of global crime organisations, I argue it is more necessary than ever that Austrian courts leverage international laws to protect the Austrian people as well as people all around the world against the bird flu and other threats, posed in particular by the "Illuminati" global racketeering influenced organised crime syndicate.

As evidence for Baxter's participation in a secret, black international bioweapons programme, I cite reports that the "bird flu" virus was resurrected by US bioweapons scientists from the Spanish Flu virus in 1996 and also note that Baxter has patented a highly pathogenic bird flu virus mutation, something difficult to account for if Baxter is not doing research into weaponised bird flu strains.

As evidence that Baxter deliberately manufactured and distributed the contaminated material, I note the way the Biosecurity Level 3 regulations were systematically subverted at Baxter's facilities in Orth an der Donau.

I also note the reports in the media that the contaminated material was sent to 16 laboratories with a false or incorrect llabel as evidence of intent to deceive staff in outside laboratories into thinking they were handling relatively harmless material and into taking fewer precautions, so increasing their risk of being infected by the bird flu and acting as pandemic bird flu carriers into the general population.

I argue the fact that at least 36 to 37 laboratory staff were treated preventatively for bird flu and normal flu in hospital underlines the danger that they could have been infected with the bird flu, and could have sparked a pandemic.

In addition, I present arguments for classifying Baxter's production facilities for the vaccination material for the bird flu — specifically the use of 1,200 liter bioreactors and vero cell technology – as a dual biological weapons programme. This is because it would allow a huge amount of contaminated vaccine material to be produced rapidly if any live bird flu virus material ever got into the bioreactor in the first place.

I argue that the production and distribution of contaminated bird flu material by Baxter to 16 labs this winter showed that every safety control failed – and that another such a systematic "safeguards" failure cannot be ruled out again and nor can it be ruled out that contaminated material ends up in 1,200 liter bioreactors. I cite opinions that the Spanish Flu Pandemic of 1918-1919 was spread by contaminated vaccines.

I contend that a motive for Baxter for sparking the pandemic is profit.

In 2006, Baxter sealed a contract with the Austrian Health Ministry to supply 16 million doses of bird flu vaccines in the event of a "pandemic". This action fits the pattern of deriving an income from illegal activities which is typical of an organised crime racket.

[Note: The Austrian Health Minister who signed the deal with Baxter in 2006 is Maria Rauch-Kallat, the wife of Alfons Mensdorff-Pouilly, who was released from jail in Austria on April 3rd, 2009, after being held in custody for five weeks in connection with bribery and money-laundering involving British weapons maker BAE systems.]

I also allege that the Austrian and international authorities are involved in a cover up.

As evidence for the cover up, I cite the fact that no action has been taken by the authorities. Little to no information has been released to the public.

While none of the political parties has made a statement, a few members of parliament apparently acting on their own tabled questions to the Austrian Health Minister on March 20th to obtain information.

Questions tabled include: "Can a threat to the Austrian people be ruled out?" "What steps have been taken to stop a repeat?"

In my charges, I argue that the people of Austria have a right to be fully informed about the incident and any investigation.

I suggest the notion that Austria has a "state within a state" or a "secret army" , a group of agents who act on the orders of Illuminati and who have annexed key positions in Austrian government and authorities, and who provide cover that allows Baxter and Avir to operate more or less outside the law.

I allege that persons in charge of the Austrian mainstream media are part of the cover up of this crime syndicate. The media in gross dereliction of its duty as the fourth estate to call organisations to account has been pretty much silent about the incident here in Austria.

Because so few Austrians have heard about the way Baxter produced and sent out the pandemic material this winter, they will be more willing to allow themselves and also their children to be injected with a vaccine supplied by that same company Baxter in the event of a pandemic, I argue. The silence of the media is, therefore, I contend a necessary element in carrying out this crime.

Should millions of Austrians and Europeans die as a result of the bird flu pandemic and/or contaminated vaccine material, their homes, property, savings, farms, companies and other assets could fall to the state authorities controlled by organised crime, and so could be transferred into private hands with ease.

I argue there is a robbery motive to the murder of millions of people throughout the world by use of weaponised bird flu. I present evidence that the "Illuminati" have planned the current global financial collapse to enrich themselves, and they are now using the relatively inexpensive and efficient weaponised bird flu as part of a pre meditated plan to eliminate huge numbers of their robbed victims before these can regroup and obtain retribution.

If the international organised crime syndicate I designate as the "Illuminati" manage to kill millions or billions of people by unleashing a pandemic bird flu, they are in a position to take control not only of personal assets of their victims but also of natural resources of entire countries, resources that are increasingly valuable at a time of global warming, I argue.

You can read the document I submitted to the prosecutor in German below. Some of the quotes are in English. I'll post up the English translation as soon as it's ready.

I would appreciate any information, articles or tips relevant to the bird flu case, so that I can submit these to the prosecutor to reinforce the case.

As for the next step, I was told my file would be assigned a case number and allocated to a state prosecutor who will review the information and, if there is enough evidence of violations of laws, authorise criminal charges to be brought against Baxter and Avir.

If you want to contribute or help out, contact me, Jane, at jmburgermeister@gmail.com.

I would like to bring more such cases, also in other European countries, in a bid to reign in the crime spree.

Tools and Resources for Re-imagining Our Relationships with Each Other and the Earth

Michael R. Meuser

Baxter admits sending live avian flu viruses to subcontractor
Baxter admits contaminated seasonal flu product contained live bird flu virus.

Map Cruzin, 26 April 2009.
The Canadian Press 27 February 2009
https://web.archive.org/web/20200922134129/https://mapcruzin.com/news/swine-flu042709b.htm

The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses.

And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by the four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died. Ferrets shouldn't die from exposure to human H3N2 flu viruses.

Public health authorities concerned about what has been described as a "serious error" on Baxter's part have assumed the death of the ferrets meant the H5N1 virus in the product was live. But the company, Baxter International Inc., has been parsimonious about the amount of information it has released about the event.

On Friday, the company's director of global bioscience communications confirmed what scientists have suspected.

"It was live," Christopher Bona said in an email.

The contaminated product, which Baxter calls "experimental virus material," was made at the Orth-Donau research facility. Baxter makes its flu vaccine - including a human H5N1 vaccine for which a licence is expected shortly - at a facility in the Czech Republic.

People familiar with biosecurity rules are dismayed by evidence that human H3N2 and avian H5N1 viruses somehow co-mingled in the Orth-Donau facility. That is a dangerous practice that should not be allowed to happen, a number of experts insisted.

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences.

While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.

That mixing process, called reassortment, is one of two ways pandemic viruses are created.

There is no suggestion that happened because of this accident, however.

"We have no evidence of any reassortment, that any reassortment may have occurred," said Andraghetti.

"And we have no evidence of any increased transmissibility of the viruses that were involved in the experiment with the ferrets in the Czech Republic."

Baxter hasn't shed much light - at least not publicly - on how the accident happened. Earlier this week Bona called the mistake the result of a combination of "just the process itself, (and) technical and human error in this procedure."

He said he couldn't reveal more information because it would give away proprietary information about Baxter's production process.

Andraghetti said Friday the four investigating governments are co-operating closely with the WHO and the European Centre for Disease Control in Stockholm, Sweden.

"We are in very close contact with Austrian authorities to understand what the circumstances of the incident in their laboratory were," she said.

"And the reason for us wishing to know what has happened is to prevent similar events in the future and to share lessons that can be learned from this event with others to prevent similar events. ... This is very important."

Свински грип и в Европа, Обама май също е имал контакт с болен

Dnes.bg, 27 април 2009, 14:05

https://www.dnes.bg/world/2009/04/27/svinski-grip-i-v-evropa-obama-mai-syshto-e-imal-kontakt-s-bolen.70078

Испанският министър на здравеопазването Тринидад Хименес съобщи, че в страната е установен първи случай на свински грип у мъж, който е пребивавал в Мексико, предаде АФП.

"Изследванията на пациента в Алменса (Югоизточна Испания) за свински грип са положителни", заяви министърът на пресконференция.

Това е първият потвърден случай в Европа.

Броят на хората в Испания, които проявяват симптоми на заболяването, се е увеличил на около 20 души.

Годината е 2006. Американската фармацевтична корпорация Бакстер подписва договор с Австрия за разпространение на антигрипна ваксина. <...>

Първоначално публикавано от научната група PROMED съобщение е, че антигрипната ваксина на Бакстер "случайно" е замърсена не само с H5N1 щам на обикновения грип, но и с живи вируси от типа "птичи грип" - смъртоносния H3N2. Казано накратко, не било ваксина, а било зараза. И то не каква да е, а кръстоска между обикновен грип със смъртоносен щам. Тази ваксина била пробутана в Австрия, Словакия и Чехия. Освен там била подготвена за доставка на още 18 страни.

Pandemic Nonsense: Flying Pig Flu

Are globalist fear-mongers driving the media to panic the public into universal healthcare solutions?
Or federally-mandated vaccinations?

The August Forecast, 28 April 2009
https://web.archive.org/web/20090710180814/http://www.augustreview.com/news_commentary/general/pandemic_nonsense:_flying_pig_flu_20090428118/

By definition, a "pandemic" is an epidemic that is geographically widespread. Fear-mongers are always careful to add the innuendo that millions of people could and probably will die, as in the Spanish Flu pandemic of 1918 that killed between 20 and 100 million people worldwide.

Excuse me, but how does the death of even a few hundred equate to 20 million?

Mexico, not the usual Southeast Asia, is the origin of the latest flu outbreak. It has spread in limited numbers to several continents. Almost all of the deaths, limited as they are, are in Mexico. The ratio of deaths to infections is very small.

Again, how does this outbreak even remotely qualify as a pandemic?
Answer: It does not!

Scientists and virus researchers are baffled because the genetic makeup of the virus contains elements of human, swine and bird flu from three geographic regions: North America, Europe and Asia. Until now, this has been unknown in nature, but not theoretically impossible.

see: New flu combines pig, bird, human virus
https://web.archive.org/web/20090731105917/http://www.globalresearch.ca/index.php?context=va&aid=14550
see: Mexico Seeks to Stop Spread of Deadly Flu
https://web.archive.org/web/20090429114232/http://www.npr.org/templates/story/story.php?storyId=103459566

Because of its unique genetic makeup, this writer proposes calling it the "flying pig flu", or FPF, instead.

This writer is hardly qualified to write with authority about the scientific side of viruses. However, after reading several authoritative papers on swine and avian flu, several observations can be made.

In the world of virus experts, there are two types of researchers: *Observers* and *Experimenters*.

Observers

Most researchers are highly trained scientific observers. These "Sherlock Holmes" scientists examine the pathology of virus development. Where did it originate? What animals or human were involved? Did the infected humans handle animals? Are certain strains limited to geography? You get the idea.

Without good observers, we would know little about the source or spread of different viral strains.

There are several good Internet resources where the findings of research observers are published. (For instance, see H5N1 - Ultimate News on mutation)

We should be thankful for astute observers who can untangle mysteries that would otherwise not be understood.

Experimenters

A minority of researchers are experimenters. This group is worrisome.

Experimenters establish their playground in trying to create different types of viruses in order to measure their effect on test animals.

Such was the case at Baxter AG, when such an experiment was "accidentally" released as a live virus in a vaccine distributed to 18 countries. (See Baxter: Product contained live bird flu virus). In this case, the live H5N1 virus (avian flu) was combined with the much more contagious (human) H3N2 virus.

Experts say that it is almost impossible for Baxter to make such a grievous error by accident. Czech newspapers, where the story was originally broken, suggest it was a rogue employee or a mole that purposely mixed the virus' together, but nothing has been proven as yet. Baxter is now under great suspicion that it is attempting to foment a pandemic that would bring hundreds of millions of dollars in revenue to supply its normal H5N1 vaccine.

Another example is the Center for Disease Control in Atlanta, Georgia. In a 2004 report, CDC to mix avian, human flu viruses in pandemic study, it was noted that,

"*The Centers for Disease Control and Prevention (CDC) will soon launch experiments designed to combine the H5N1 virus and human flu viruses and then see how the resulting hybrids affect animals. The goal is to assess the chances that such a "reassortant" virus will emerge and how dangerous it might be."*

Critics worried that such a "franken-virus" could itself cause a pandemic if it escaped from its creators. The CDC's only response is that their facilities were more secure than others who had experienced breaches of some sort in years past.

Why would the CDC risk world exposure to an artificially created virus? According to the above report, it was done in the name of preparedness.

As mentioned above, experimenters are a worrisome lot. Real world experience indicates that they are generally overconfident in their scientific prowess and in their abilities to contain the unpredictable fruit of their experiments.

Conclusion

There are some big problems with the current outbreak of flying pig flu. If there has been foul play, it may never be brought to light. Still, tough questions need to be asked:

- While it is not unknown for pigs to become infected with the H5N1 virus, the result has *always* been a less-lethal and less-contagious virus than avian flu by itself. Why is this epidemic so obviously contagious?
- How would genetic code from three continents find its way into a single strain in Mexico City?
- Is this virus an escaped experiment from a project gone awry?
- If man-made and not accidentally released, then who released it, and why?

As we contemplate these questions, watch the stock prices of major pharma companies skyrocket as they gear up to sell billions in vaccines. Watch governments as they declare mandatory vaccination programs. Watch the Obama administration as it railroads universal healthcare through Congress.

Indeed, *flying pig flu* may be just the right name for whatever is responsible for this particular flu outbreak.

In the meantime, we can reopen this case when pigs fly or when 10 million or so people have died, whichever comes first.

Steve Watson

Lawsuit Charges Baxter Used Dangerous Ingredients In Vaccines To Increase Profits

Prison Planet, April 30, 2009
https://web.archive.org/web/20090502173552/http://www.prisonplanet.com/lawsuit-charges-baxter-used-dangerous-ingredients-in-vaccines-to-increase-profits.html

A scandal dating from January 2008, that is continuing to unfold, raises more disturbing questions over the safety of U.S. pharmaceutical company Baxter International's vaccines.

Last year Baxter recalled almost all of its injections of the blood thinning heparin drug in the US after some patients experienced extreme - and in some cases fatal - allergic reactions, after being administered the products.

There were similar recalls by other manufacturers of Chinese-sourced heparin in Denmark, Italy, France Germany and Japan, but initial investigations found that only Baxter's heparin vaccines were tainted.

The FDA has accused two Chinese manufacturers of being responsible for the production and shipment of the tainted vaccines, suggesting that a cheaper synthetic heparin mimic, subsequently identified as over-sulfated chondroitin sulfate (OSCS), was used to decrease costs.

However, in January 2009 a new lawsuit was filed specifically against Baxter for it's role in the scandal.

The allegation is that the pharmaceutical giant purposefully altered an ingredient in heparin that flowed through heparin syringes to patients, resulting in pain and suffering, and sometimes death, to those affected, reported legal website Lawyers and Settlements

Somewhat ironically, the natural ingredient in heparin that was substituted in order to cut costs was a substance extracted from cooked swine intestines.

The lawsuit notes that OSCS is not found in nature, and is not approved in the United States. It accuses Baxter of using a more dangerous ingredient to "reap greater profits as a result of utilizing cheap component parts."

As we reported earlier this week, Baxter has been chosen by the WHO to head up efforts to produce a vaccine for the Mexican swine flu that is spreading throughout the U.S. and Europe.

The decision was made despite further revelations last month that vaccines contaminated with deadly live H5N1 avian flu virus were recently distributed to 18 countries by a lab at an Austrian branch of Baxter.

Initially, the company attempted to stonewall questions by invoking "trade secrets" and refused to reveal how the vaccines were contaminated with H5N1. After increased pressure they then claimed that pure H5N1 batches were sent by accident.

However, as we have highlighted, the probability of mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

outsidermedia

Obviňuji Vás z přípravy masové vraždy! (I)

Outsider Media, 3 May 2009
https://outsidermedia.cz/Obvinuji-Vas-z-pripravy-masove-vrazdy-II/
https://web.archive.org/web/20220818105236/https://outsidermedia.cz/Obvinuji-Vas-z-pripravy-masove-vrazdy-II/

První část dopisu rakouské novinářky Jane Burgermeister generální ředitelce WHO (Světové zdravotnické organizace). Tato novinářka již podala žalobu na firmu Baxter pro podezření ze snahy o rozpoutání pandemie. O tomto případu jsme vás již informovali v březnu tohoto roku.

***

From: Jane Burgermeister (jmburgermeister@gmail.com)

Date: April 25, 2009

Subject: Obvinění připravované proti dr. M. Chan a WHO pro zločin masové vraždy

Vážená paní doktorko Margaret Chan,

zasílám tento email, abych Vás informovala o svém záměru podat v pondělí 27. 4. soudní žalobu proti Vám i ostatním zaměstnancům WHO a spojených organizací kvůli vašemu podílu na tom, že byla světová populace vystavena riziku pandemického viru, který by mohl zabít miliardy lidí, a to dle zákona o boji proti zločinu organizovanému mezinárodními gangsterskými skupinami a rovněž dle konvence Spojených národů o prevenci a trestání genocidy.

Jako veřejný činitel, který je zaměstnán v mezinárodní organizaci ve funkci generální ředitelky Světové zdravotnické organizace se sídlem v Ženevě, máte jako povinnost a součást své náplně práce jednat vždy tak, abyste byla strážcem zdraví světové populace, zvláště předcházet „zneužití“ vyhlášení pandemie organizacemi, společnostmi, vládními orgány nebo jinými celky, které mají v úmyslu vypustit pandemický virus a poté získat pomocí programu všeobecné plošné vakcinace zamořeným materiálem politické a ekonomické výhody z masové vraždy.

Zprávy médií ukazují, že vaše organizace zneužívá svou organizační strukturu, personál a služby, aby zveličovala nebezpečí viru prasečí chřipky, a tím ospravedlnila právě takové plošné očkování nevyzkoušenou a neotestovanou vakcínou. WHO poprvé v dějinách nařídila všem svým členům, aby nepřetržitě obsluhovali „Místnost pro kontrolu pandemie“ jako reakci na včera v médiích ohlášené případy prasečí chřipky, a je bezprostředně připravena vyhlásit „pandemii“. Tato „Místnost pro kontrolu pandemie“ je zřízena za účelem sledování šíření pandemického viru, a tudíž je vybavena superpočítači napojenými na veškeré bezpečnostní síly vlád členských států Spojených národů. Tato „Mistnost pro kontrolu pandemie“ je místem, odkud vzejdou veškerá prohlášení o „pandemii“, a já bych byla vděčná, kdybyste mohla zveřejnit seznam lidí, kteří pracují v této kontrolní místnosti.

Když WHO totiž vyšle takovéto „prohlášení“ presidentu Obamovi, budou po celé zemi rozmístěny jednotky FEMA a DHS (bezpečnostní síly), tzv. „Protipandemické oddíly“. Guvernérům všech států USA bude sděleno, že budou do praxe zavedena opatření zákona Model State Emergency Health

Powers Act (MSEHPA). To znamená, že všichni Američané musí souhlasit s plošnou vakcinací, jinak budou obviněni z hrdelního zločinu. Nebylo by lepší, doktorko Chanová, abyste prostě požádala lidi, kteří to odmítnou, aby nosili chirurgickou roušku, pokud je zde opravdu reálné nebezpečí pandemie? Proč činit nátlak na vakcinaci pod hrozbou zastřelení? Zákon praví, že každý, kdo odmítne očkování anebo se staví proti nucenému přemístění do připravených „karanténních zařízení“, může být vystaven „legální“ střelbě a může být zabit. (Ospravedlněné „smrtelné donucení“).

Jste si jistě vědoma těchto skutečností. Je to tak krutý scénář, že Vy ve svém postavení veřejného činitele musíte mít pádné důkazy, že se jedná o extrémní nebezpečí pro lidskou populaci a musíte mít ověřené a nepochybné zdůvodnění, že Vaše akce budou skutečně zaměřeny proti této hrozbě, a že je dobrý důvod, proč prostě nedoporučíte nosit chirurgickou masku lidem, kteří se nechtějí nechat očkovat.

Zprávy médií naznačují, že nový kmen prasečí chřipky je uměle vytvořená kombinace, která obsahuje geny ptačí, lidské a prasečí chřipky z několika různých kontinentů. Existují tedy důvody, které nás mohou vést k domněnce, že pochází z nějaké laboratoře, a to spíše z laboratoře na výrobu biologických zbraní. Nebylo by pro WHO lepší, aby poskytla odbornou pomoc při vyšetřování laboratoře, která vyrobila a vypustila tento syntetický virus, a poté ji pohnala před soud? Neměla by raději lidem doporučit nosit roušky, než vyhlašovat plošný očkovací plán? Podle níže uvedené zprávy Fox News je vaše hodnocení nebezpečí této prasečí chřipky mnohem více pesimistické než hodnocení CDC (Americké centrum pro kontrolu nemocí), jež doporučuje pouze obvyklá opatření. Jak to vysvětlíte?

Jak vysvětlíte, že jste již označili tolik smrtelných případů, zatímco mexická vláda potvrdila pouze 16 úmrtí způsobených tímto kmenem chřipky? O jaký vědecký podklad se opírá toto vaše určení počtu úmrtí? Používáte k tomu správnou metodu? Můžete u soudu dokázat, že užíváte správnou metodu, a že prosté doporučení lidem, aby nosili operační roušky, není dostačující?

Upozorňuji vás, že nový kmen prasečí chřipky se objevil zároveň v Mexiku a Americe, a to za „záhadných okolností“, což také ukazuje na úmyslné, plánované a koordinované vypouštění umělých, v laboratoři syntetizovaných virů. Neměli byste raději vyšetřovat tuto „tajemnou příhodu“? Zahájili jste nějaké vyšetřování? Koho vyšetřujete? Uveďte podrobnosti, prosím.

WHO je povinna využít všechny ostatní postupy dříve, než vyhlásí pandemii a zahájí plošné očkování, a proto je Vaší úřední povinností vědět, že v roce 1976 muselo být americkou vládou zrušeno plošné očkování proti prasečí chřipce, protože přibývalo důkazů, že jeho rizika pro veřejnost jsou větší než riziko skutečné prasečí chřipky. Vzhledem k tomuto precedentu z roku 1976 jste obzvláště povinna se ujistit, že pod vaší záštitou nebude předčasně vyhlášena pandemie a nebude provedeno žádné plošné očkování, pokud nebude ohrožena široká veřejnost a potvrzena vysoká kvalita a bezpečnost použitých vakcin. Musíte také prokázat, že doporučení nosit operační roušku není funkční alternativou při obraně před jakoukoliv údajnou pandemií.

Jsem přesvědčena, že neplníte své povinnosti tím, že

a) neposkytujete veřejnosti přesné informace o ohrožení, které pro ně představuje prasečí chřipka

b) jste se neujistila, zda předčasné vyhlášení pandemie nebude záminkou k rychlému šíření zamořených nebo závadných vakcin, které by mohly vést ke smrti či poškození lidí, jak se již událo v roce 1976

Jako veřejný činitel, jehož náplní práce je v současné době vyšetřování firem Baxter a Avir, zapletených do úniku pandemického materiálu s virem ptačí chřipky v Rakousku, jste povinna plně si uvědomovat okolnosti tohoto případu a role, kterou farmaceutická společnost, jmenovitě Baxter, hrála v tom, že byla téměř spuštěna pandemie. Měla byste také vědět o trestních oznámeních, která

jsem 8. dubna 2009 v této věci podala u vídeňské městské prokuratury proti Baxteru a dalším subjektům, včetně WHO, a jež jsou dostupná na blogu. Referenční centrum WHO poskytlo společnosti Baxter mimořádně smrtící divoký typ ptačí chřipky, kterým byla v konečném důsledku zamořena očkovací látka proti běžné lidské chřipce, jež byla poté distribuována do šestnácti laboratoří v Rakousku, České republice, Slovinsku a Německu pod falešným označením, a tak se ptačí chřipka mohla dle hodnocení expertů a médií v minulém zimním období rozšířit na pandemii. Viry namíchané v laboratoři mohly způsobit pandemii (6. března 2009)
http://timesofindia.indiatimes.com/articleshow/4230882.cms.

Je jasné, že v této kauze Baxter lze vidět dobře rozeznatelnou vazbu mezi WHO a únikem pandemické vakciny s virem ptačí chřipky v Evropě. Podle zpráv provádí WHO vyšetřování, jež má zjistit jakou roli měly společnosti Baxter a Avir při výrobě a distribuci této látky, ale doposud nebyly veřejnosti sděleny žádné výsledky tohoto vyšetřování, ani vydána doporučení ke zpřísnění bezpečnostních pravidel pro laboratoře, které pracují s vysoce patogennímy viry ptačí chřipky. Proč?

Tvrdím, že Vaše selhání při vedení úplného a detailního vyšetřování tohoto případu, a také při zveřejnění závěrů a vydání jasných doporučení k tomu, aby se předešlo opakování takových incidentů, je nejenom selháním ve výkonu vašich povinností veřejného činitele, ale také důkaz Vaší účasti při zakrývání skutečného původce pandemického viru, jímž je právě referenční centrum WHO. V mém trestním oznámení, podaném 8. dubna vídeňské prokuratuře, obviňuji firmu Baxter, že se pokoušela úmyslně spustit pandemii s cílem vydělat na tom tím, že měla dopředu uzavřené lukrativní smlouvy na dodávku vakcin proti ptačí chřipce s rakouským ministerstvem zahraničí z roku 2006, především smlouvu uzavřenou s rakouskou ministryní zdravotnictví Marií Rauch-Kallatovou, která obsahovala dodávku 16 milion očkovacích dávek v případě, že WHO vyhlásí pandemii ptačí chřipky.

outsidermedia

Obviňuji Vás z přípravy masové vraždy! (II)

Outsider Media, 4 May 2009
https://web.archive.org/web/20090724160330/http://www.outsidermedia.cz/Obvinuji-Vas-z-masove-vrazdy-1.aspx

V Německu je povinné očkování proti ptačí chřipce, které zajišťuje vyšší zisky farmaceutickým společnostem, navíc k tomu i motivaci pro spuštění pandemie, protože by z toho tyto společnosti měly zisk. Také je to motivací pro přehnaný nátlak na členy WHO, aby vyhlásili pandemii bez patřičného důvodu. S odvoláním na zákony proti vyděračsky působícím zločineckým organizacím jsem se snažila dokázat, že do vedoucích funkcí v organizacích, jako je například WHO, byli infiltrovány zločinecké živly, které v současnosti napomáhají další kriminální činnosti, jež zahrnuje loupežné vraždy, jež jsou maskovány jako tajné programy vývoje biologických zbraní. Výsledkem takové činnosti firmy Baxter bylo, že nejméně 35 lidí v Rakousku a ČR muselo dostat preventivní ochranu proti ptačí i běžné lidské chřipce v nemocnici. To znamená, že podle profesionálního mínění zdravotnického personálu existovalo skutečné, hmatatelné a specifické ohrožení zdraví těchto osob od materiálu kontaminovaného Baxterem a WHO, takže bylo okamžitě přikročeno k podání účinných léků.

Zjistila jsem, že personál v české laboratoři, který se dostal do kontaktu se zamořenou vakcinou společnosti Baxter, a který o tom poprvé informoval 6. února, byl přemístěn do karantény. Jestliže je skutečností, že tento incident se stal jen před několika týdny, a vaše organizace je v něm zapojena tím, že dodala smrtící kmen viru ptačí chřipky a vyšetřuje tento případ, je vaší povinností uvědomit si všechny podrobnosti, obvinění ze zločinných pohnutek, argumenty i protiargumenty pro tato obvinění, protože existuje mnoho analogií k tomuto novému případu "prasečí chřipky," mimo jiné uměle vytvořená struktura a záhadné objevení se nákazy na dvou místech zároveň.

A dále, měli byste být informováni o té skutečnosti, že Baxter používá režim zabezpečení Biosafety třetího stupně, v němž je náhodná kontaminace vysoce patogenního smrtelného kmene viru ptačí chřipky, který jste jim poslali ze svého referenčního centra, s humánním virem chřipky prakticky nemožná.

Musíte také vědět o výzkumu Jeffrey K. Taubenbergera z Department of Molecular Pathology, Armed Forces Institute of Pathology (Oddělení molekulární patologie Armádního patologického ústavu), který se zabýval viry ptačí chřipky, a zvláště o jeho rekonstrukci smrtícího kmene ptačí chřipky z genetického materiálu získaného z obětí pandemie španělské chřipky v letech 1918 – 1919. Přestože mnoho vědců a nevládních organizací vydalo varování, že vzkříšení tohoto smrtícího viru je nebezpečné pro veřejnost, WHO byla jedním z největších zastánců toho, aby se pokračovalo ve výzkumu tohoto bioinženýrsky získaného viru a „protilátek" proti němu, přičemž se utratily miliony dolarů daňových poplatníků na výzkum a preventivní programy.

Musíte vědět, že loni v létě tento vědec zveřejnil ve vědeckém časopise důkaz, jenž prokazuje, že se ptačí chřipka může smísit s virem lidské chřipky v laboratorních podmínkách. Jistě také máte informace o probíhajícím vyšetřování zločinu v Polsku, v němž jde o smrt bezdomovců poté, kdy byli loni v létě naočkování doktory a zdravotními sestrami. Z těchto důvodů tvrdím, že je dostatek důkazů z veřejných zdrojů, jež ukazují, že farmaceutické společnosti, vládní organizace i další

činitelé vědomě a úmyslně vytvářejí pandemické látky virové povahy, a jak jsme viděli v minulém zimním období v Rakousku, uvolňují je do populace, a přitom se pokoušejí skrýt svoji odpovědnost.

Kdybyste Vy a WHO v tuto chvíli vyhlásili pandemii kvůli prasečí chřipce v USA, a kdyby lidé začali umírat v přímém důsledku s plošnou vakcinací, kterou zahájíte, a kdyby přitom existovaly závažné důkazy o škodách a zdravotním poškození lidí v přímé souvislosti s plošným očkováním, které jste zahájili, jak se to stalo v roce 1976, mohlo by se stát, že nebudete obviněna pouze z přípravy masové vraždy, ale z jejího uskutečnění. Kromě toho, pokud jsem byla informována, Světová zdravotnická organizace publikovala studii, posuzující hospodářský dopad pandemického viru.

Pokud Vy, jako součást tohoto úřadu pomáháte zločineckým organizacím, které ovládly vysoké státní úřady proto, aby mohly provádět své zločiny, iniciovat a poté vyhlásit pandemii, jež rozvrátí hospodářství, potom Vy, další vedoucí představitelé pracující pro WHO s úředním pověřením, i WHO sama jako organizace, by se mohli zodpovídat nejen z obvinění za trestné činy, ale také za škody vyplývající z hromadných žalob podaných nejen občany USA, ale i občany či společnostmi z celého světa, kteří zjistili, že jejich příjmy poklesly jako přímý důsledek pandemie, která byla takto rozpoutána, a také jí následujících hospodářských potíží.

Pokud dojde k vyhlášení epidemie ze strany WHO a hromadným úmrtím, která budou způsobena plošným očkováním, předpovídám situaci, že Vy a WHO budete čelit tisícům trestních oznámení a hromadných žalob. Tvrdím, že způsob, jakým jste se chovali v kauze Baxter je důkazem, že jste nejednala ve veřejném zájmu, jak Vám to ukládá funkce, kterou vykonáváte, ale ve skutečnosti jste podporovala skryté zločinné zájmy spočívající v iniciaci pandemie a zneužití jejího vyhlášení k tomu, aby byly získány politické a finanční výhody pro skupinu, kterou označuji jako Zločinný gang iluminátů (Iluminati crime gang).

Vyhlášení pandemie ze strany Světové zdravotnické organizace dává přímé politické, finanční i jiné výhody živlům v americké vládě, zvláště těm, které označuji jako Zločinný gang iluminátů, NWO, CIA a zednářů, proti nimž se připravuje stíhání za protizákonné mučení na Guantanámu, které je v rozporu s americkým i mezinárodním právem, zvláště Donalda Rumsfelda (jenž má finanční vazby na výrobce protichřipkového léku Tamiflu), Richarda Cheneyho a Alberta Gonzalese. Vyhlášení stanného práva pomůže každému obviněnému z protiprávního mučení, aby se vyhnul stíhání v USA, ačkoliv kauza probíhá ve Španělsku.

Tvrdím, že vědomě a úmyslně zneužíváte svoji úřední moc ředitelky WHO, abyste pomohla těmto iluminátům dosáhnout politických a finančních cílů. Tvrdím, že dnes existují důkazy, že úmyslně dezinformujete o nákaze prasečí chřipkou, jež údajně začala včera, abyste zveličila nebezpečí pandemie za účelem ospravedlnit plošné očkování, přičemž ignorujete a potlačujete informace, které označují takovou reakci jako neadekvátní riziku. A na závěr, Vás žádám, abyste mi do pondělí 27. dubna, do 10 hodin SEČ poskytla následující dokumentaci v podobě příloh emailu, odkazů, právních informací atd. tak, abych je mohla posoudit před tím, než podám další trestní oznámení v této věci.

Zvláště Vás žádám o to, abyste mi sama nebo prostřednictvím svých podřízených poslala:

a) Vědecké studie, o vakcinách, jež hodláte použít k plošné vakcinaci populace v USA, jež podají jasné důkazy z respektovaných vědeckých kruhů, o tom, že proběhly klinické testy, jejichž výsledky byly publikovány v prestižních vědeckých časopisech, a jež jednoznačně potvrzují jejich bezpečnost.

b) Informace o genových sekvencích prasečí chřipky, které WHO doposud zjistila u obětí nákazy v Mexiku a Spojených státech

c) Informace o tom, které společnosti nasmlouvaly s WHO dodávky vakcin proti prasečí chřipce, jejich termíny a dohodnuté podmínky, včetně garance kvality a cenových ujednání.

d) Detailní rozpis všech bezpečnostních procedur a nezávislých dobrozdání, jimiž WHO zaručuje, že veškeré očkování splňuje uznávané standardy bezpečnosti a kvality.

e) Dokumenty prokazující, že máte patřičnou pravomoc vyhlásit v případě prasečí chřipky pandemii a přinutit násilím celou populaci, aby se nechala očkovat ve formě právních ustanovení, směrnic apod.

Pošlete mi, prosím, všechny tyto dokumenty jako přílohy mailu. Pokud nestihnete pondělní termín, budu v mém podání k soudu tvrdit, že nemáte takové dokumenty. Žádám Vás, abyste se ujistila, že jste si ponechala kopii mailu, který mi pošlete, takže budete moci doložit soudu, že:

a) Máte všechna náležitá oprávnění a dokumenty

b) Držíte je v rukou dostupné pro veřejný dohled a zběžné nahlédnutí v situaci ohrožení, což je Vaší povinností veřejného činitele

Age of Autism

A Lethal Mixture: Swine and Bird Flu. Can We Trust Baxter, GSK and the WHO?

Age of Autism, 17 May 2009, at 08:15 PM
https://www.ageofautism.com/2009/05/a-lethal-mixture-swine-and-bird-flu-can-we-trust-baxter-gsk-and-the-who.html

The most recent paroxysm in the swine flu saga begs some interesting questions which scarcely ought to be swept aside. Last week veteran Australian scientist, Adrian Gibbs, author of 250 peer review studies raised the issue whether H1N1 virus could have been created in a lab error. Of course, denials were rapid. ABC News reported (HERE.)

"Technically it's plausible but not likely," (said) Christopher Ohl, an associate professor of medicine at Wake Forest University School of Medicine, and a specialist in infectious diseases.

"In this case I'm not concerned that this virus represents anything other than a naturally occurring mixture of viruses happening in nature," concluded Dr. Julie Gerberding, an infectious disease expert and the former director of the CDC...

"Regardless of the validity of Gibb's claims, he and several experts say that just bringing the idea of laboratory security to the public's attention is important.

"There are lives at risk," Gibbs said. "The sooner this idea gets out, the better."

"In 2001, foot-and-mouth disease led to the slaughter of more than 6 million animals, all after a vial went missing from a research laboratory in the United Kingdom.

"Since then, however, experts said lab security and regulations have been getting tighter and better.

"Laboratories have a lot of security from having this happen, and it's very unlikely," Ohl said of the new theory about swine flu's origin."

But have things improved since 2001?

Probably the scariest story this year has so far been overlooked by the media at large. On February 27 an article appeared in the Toronto Sun by Helen Branwell, 'Baxter: Product contained live bird flu virus' (HERE.)

"The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses. "And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

“The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany.

“The contamination incident, which is being investigated by the four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died. Ferrets shouldn’t die from exposure to human H3N2 flu viruses...”

According to science columnist Mark Henderson writing in the London Times on May 4, the real danger from the new swine flu virus H1N1 would be if it combined with the previous big viral scare, avian flu H5N1:

"The biggest worry would be if a person or a pig became infected with both swine flu and H5N1 avian flu at the same time. As the former is highly transmissible but does not appear to be particularly lethal, while the latter is highly virulent but does not spread easily, a reassortment between the two could generate a very dangerous strain."

Of course, it would not be wise on its own to take anything Henderson says too seriously, bearing in mind his boss is a director of pharmaceutical giant GlaxoSmithKline (HERE) and he is associated with the pharmaceutical lobby organisation Sense About Science (HERE.) However, bearing in mind the Toronto Sun story of February it is not exactly encouraging that WHO and the CDC have chosen Baxter as well as GlaxoSmithKline to develop a vaccine against H1N1 (HERE.)

So many aspects of these stories are not re-assuring. There have been no further reports on the Baxter bird flu fiasco since February, which at best sounds like criminal negligence of a high order – meanwhile the WHO and CDC remain silent. Health officials have failed to deny that the swine flu virus could have been created in a laboratory, but merely claim that such a security lapse is unlikely, when we know a much worse one occurred within the last 3 months. And Julie Gerberding, out-going director of CDC, fails to deny that swine flu is man-made but only tells us that she is “not concerned”.

John Stone, based in London, is a Contributing Editor to Age of Autism.

Viral Pandemic H5N1 flu threat
Baxter contaminates European labs by error

Map Cruzin, 30 May 2009 // LifeGen.de, 25 February 2009
https://web.archive.org/web/20090529232302/https://mapcruzin.com/news/swine-flu042709d.htm
https://web.archive.org/web/20090430135214/http://www.lifegen.de/newsip/shownews.php4?getnews=2009-02-25-5123

It could be a Hollywood Worst Case Thriller, but it is real:

According to the scientific network PROMED, Baxter International Inc. in Austria "unintentionally contaminated samples with the bird flu virus that were used in laboratories in 3 neighboring countries, raising concern about the potential spread of the deadly disease". As PROMED reports, the contamination has been discovered when ferrets at a laboratory in the Czech Republic died after being inoculated with vaccine made from the samples early this month. "The material came from Deerfield, Illinois-based Baxter, which reported the incident to the Austrian Ministry of Health, Sigrid Rosenberger, a ministry spokeswoman, said today in a telephone interview", the network-alert-system is quoting. "This was infected with a bird flu virus," Rosenberger said. "There were some people from the company who handled it." There are severe signs that the long expected pandemic avian influenza could be on its way to conquer the world - even without Baxter's error driven help. by Vlad Dan Georgescu and Marita Vollborn

First deaths in Asia concern little children, which from virological point of view is a rather new aspect, and could be the evidence for a new spread. While scientists expect this pandemic to happen in the near future, the new President should also stay alert: A coming influenza pandemic would deteriorate the global economy even without financial crisis, recession – or Baxter.

Evidence for the global threat comes from China, where a 2 year old girl has been confirmed to be infected with bird flu in the northern Shanxi Province, as government officials said last Saturday. The child was found ill on 7th of January in the central Hunan province - the little patient still is in critical condition. According to the test result of the Chinese Center for Disease Control and Prevention, the girl had been tested positive for the H5N1 strain of avian influenza.

On the other site of the globe, the Ministry of Health and Population of Egypt announced a new human case of avian influenza A(H5N1) virus infection last week, the case being a 21 month old girl Kerdasa District.

“Infection with the H5N1 avian influenza virus was diagnosed by PCR at the Egyptian Central Public Health Laboratory and subsequently confirmed by the U. S. Naval Medical Research Unit No. 3 (NAMRU-3) laboratories”, reports the special wire PROMED. According to PROMED, investigations into the source of her infection indicate a recent history of contact with sick and dead poultry - 23 similar cases in Egypt have been fatal up to date.

Old Europe as leading research power?

Given such facts, Mr. Obama should follow European research policy: European research on vaccine development for pandemic influenza has been financed since 2001 by the European Union. Early projects worked to develop an egg-free vaccine, which is faster and safer to produce, along

with innovative application techniques. Research is now underway with the objectives of fighting the disease at the source (infected birds) and protecting human populations through pandemic influenza vaccines. Future EU research will improve vaccine efficiency by adding adjuvants, substances that boost the body's immune response to vaccine antigen. Additionally, research teams are currently focused on developing a universal flu vaccine that could provide a lifetime of protection from influenza.

Latest surveillance data coming through the European Centre for Disease Prevention and Control (ECDC) from virologists and clinicians indicates that the influenza A(H3N2) virus is the predominant strain in Europe so far this season (2008/2009). Based on the data published by ECDC the pharmaceutical company Roche confirms that the oral antiviral Tamiflu (oseltamivir) is fully active against influenza A(H3N2) and influenza B, which currently comprise 94 percent of circulating viruses in Europe this year. Tamiflu resistance reported in the 2008-2009 influenza seasons is confined to H1N1. No resistance has been seen with other circulating seasonal viruses - H3N2 and influenza B.

"Recent media reporting has elevated awareness of the H1N1 seasonal resistance seen this year in the United States and the Far East. However, in Europe the picture is different with H3N2 being the dominant strain so far. The circulating H3N2 viruses, which often cause a more severe illness than H1N1, are sensitive to oseltamivir, which means that oseltamivir will be active against the vast majority of influenza infections in Europe this season, if current trends continue," comments Prof Albert Osterhaus, Head of Virology, Erasmus Medical Centre, Rotterdam. "It is important that doctors understand that oseltamivir remains an effective treatment for patients across Europe."

Flu alert for the new President

However, the situation in the United States is more alerting, according to the Centers for Disease Control and Prevention (CDC). A new University of Colorado at Boulder study showed the resistance of the avian flu virus to a major class of antiviral drugs "is increasing through positive evolutionary selection, with researchers documenting the trend in more than 30 percent of the samples tested", as the scientists report. Even if the expected influenza pandemic did not start yet, there is no doubt about the comeback of the lethal virus: The first Pandemic Influenza occurred in three waves in the United States - exactly 90 years ago, between 1918 and 1919.

Pandemic Timeline

Chronological Sequence of Events

Charges filed against WHO, UN, others

Pandemic Time line 10 June 2009
https://pandemictimeline.com/2009/06/charges-filed-against-who-un-others/

Journalist Jane Bürgermeister files charges with the FBI against the World Health Organization (WHO), the United Nations (UN), and several of the highest-ranking government and corporate officials concerning bioterrorism and attempts to commit mass murder. She has also prepared an injunction against forced vaccination which is being filed in America. These actions follow her charges filed in April against Baxter AG and Avir Green Hills Biotechnology of Austria for producing contaminated bird flu vaccine, alleging this was a deliberate act to cause and profit from a pandemic.

She had previously filed charges on April 8, 2009, with the Vienna City Courthouse where she lives against Baxter AG and Avir Green Hills Biotechnology of Austria. See her post of April 13, 2009, Charges filed with the 1st part translated into English (archived).

Journalist Files Charges against WHO and UN for Bioterrorism and Intent to Commit Mass Murder

Natural Health Editor, Thursday, 25 June 2009
https://web.archive.org/web/20090627093227/https://www.naturalnews.com/026503_pandemic_swine_flu_bioterrorism.html

As the anticipated July release date for Baxter's A/H1N1 flu pandemic vaccine approaches, an Austrian investigative journalist is warning the world that the greatest crime in the history of humanity is underway. Jane Burgermeister has recently filed criminal charges with the FBI against the World Health Organization (WHO), the United Nations (UN), and several of the highest ranking government and corporate officials concerning bioterrorism and attempts to commit mass murder. She has also prepared an injunction against forced vaccination which is being filed in America. These actions follow her charges filed in April against Baxter AG and Avir Green Hills Biotechnology of Austria for producing contaminated bird flu vaccine, alleging this was a deliberate act to cause and profit from a pandemic.

Summary of claims and allegations filed with FBI in Austria on June 10, 2009

In her charges, Burgermeister presents evidence of acts of bioterrorism that is in violation of U.S. law by a group operating within the U.S. under the direction of international bankers who control the Federal Reserve, as well as WHO, UN and NATO. This bioterrorism is for the purpose of carrying out a mass genocide against the U.S. population by use of a genetically engineered flu pandemic virus with the intent of causing death. This group has annexed high government offices in the U.S.

Specifically, evidence is presented that the defendants, Barack Obama, President of the U.S, David Nabarro, UN System Coordinator for Influenza, Margaret Chan, Director-General of WHO, Kathleen Sibelius, Secretary of Department of Health and Human Services, Janet Napolitano, Secretary of Department of Homeland Security, David de Rotschild, banker, David Rockefeller, banker, George Soros, banker, Werner Faymann, Chancellor of Austria, and Alois Stoger, Austrian Health Minister, among others, are part of this international corporate criminal syndicate which has developed, produced, stockpiled and employed biological weapons to eliminate the population of the U.S. and other countries for financial and political gain.

The charges contend that these defendants conspired with each other and others to devise, fund and participate in the final phase of the implementation of a covert international bioweapons program involving the pharmaceutical companies Baxter and Novartis. They did this by bioengineering and then releasing lethal biological agents, specifically the "bird flu" virus and the "swine flu virus" in order to have a pretext to implement a forced mass vaccination program which would be the means of administering a toxic biological agent to cause death and injury to the people of the U.S. This action is in direct violation of the Biological Weapons Anti-terrorism Act.

Burgermeister's charges include evidence that Baxter AG, Austrian subsidiary of Baxter International, deliberately sent out 72 kilos of live bird flu virus, supplied by the WHO in the winter of 2009 to 16 laboratories in four counties. She claims this evidence offers clear proof that the pharmaceutical companies and international government agencies themselves are actively engaged in producing, developing, manufacturing and distributing biological agents classified as the most deadly bioweapons on earth in order to trigger a pandemic and cause mass death.

In her April charges, she noted that Baxter's lab in Austria, one of the supposedly most secure biosecurity labs in the world, did not adhere to the most basic and essential steps to keep 72 kilos of a pathogen classified as a bioweapon secure and separate from all other substances under stringent biosecurity level regulations, but it allowed it to be mixed with the ordinary human flu virus and sent from its facilities in Orth in the Donau.

In February, when a staff member at BioTest in the Czech Republic tested the material meant for candidate vaccines on ferrets, the ferrets died. This incident was not followed up by any investigation from the WHO, EU, or Austrian health authorities. There was no investigation of the content of the virus material, and there is no data on the genetic sequence of the virus released.

In answer to parliamentary questions on May 20th, the Austrian Health Minister, Alois Stoger, revealed that the incident had been handled not as a biosecurity lapse, as it should have been, but as an offence against the veterinary code. A veterinary doctor was sent to the lab for a brief inspection.

Burgermeister's dossier reveals that the release of the virus was to be an essential step for triggering a pandemic that would allow the WHO to declare a Level 6 Pandemic. She lists the laws and decrees that would allow the UN and WHO to take over the United States in the event of pandemic. In addition, legislation requiring compliance with mandatory vaccinations would be put into force in the U.S. under conditions of pandemic declaration.

She charges that the entire "swine flu" pandemic business is premised on a massive lie that there is no natural virus out there that poses a threat to the population. She presents evidence leading to the belief that the bird flu and swine flu viruses have, in fact, been bioengineered in laboratories using funding supplied by the WHO and other government agencies, among others. This "swine flu" is a hybrid of part swine flu, part human flu and part bird flu, something that can only come from laboratories according to many experts.

WHO's claim that this "swine flu" is spreading and a pandemic must be declared ignores the fundamental causes. The viruses that were released were created and released with the help of WHO, and WHO is overwhelmingly responsible for the pandemic in the first place. In addition, the symptoms of the supposed "swine flu" are indistinguishable from regular flu or from the common cold. The "swine flu" does not cause death anymore often than the regular flu causes death.

Burgermeister notes that the figures for deaths reported for the "swine flu" are inconsistent and there is no clarity as to how the number of "deaths" has been documented.

There is no pandemic potential unless mass vaccinations are carried out to weaponize the flu under the guise of protecting the population. There are reasonable grounds for believing that the mandatory vaccines will be purposely contaminated with diseases that are specifically designed to cause death.

Reference is made to a licensed Novartis bird flu vaccine that killed 21 homeless people in Poland in the summer of 2008 and had as its "primary outcome measure" an "adverse events rate", thereby meeting the U.S. government's own definition of a bioweapon (a biological agent designed to cause an adverse events rate, i.e death or injury) with a delivery system (injection).

She alleges that the same complex of international pharmaceutical companies and international government agencies that have developed and released pandemic material have positioned themselves to profit from triggering the pandemic with contracts to supply vaccines. Media controlled by the group that is engineering the "swine flu" agenda is spreading misinformation to lull the people of the U.S. into taking the dangerous vaccine.

The people of the U.S. will suffer substantial and irreparable harm and injury if they are forced to take this unproven vaccine without their consent in accordance with the Model State Emergency Health Powers Act, National Emergency Act, National Security Presidential Directive/NSPD 51, Homeland Security Presidential Directive/HSPD-20, and the International Partnership on Avian and Pandemic Influenza.

In the U.S. since 2008, Burgermeister charges that those named in her allegations have implemented new and/or accelerated the implementation of laws and regulations designed to strip the citizens of the U.S. of their lawful constitutional rights to refuse an injection. These people have created or allowed provisions to remain in place that make it a criminal act to refuse to take an injection against pandemic viruses. They have imposed other excessive and cruel penalties such as imprisonment and/or quarantine in FEMA camps while barring the citizens of the U.S. from claiming compensation from injury or death from the forced injections. This is in violation of the laws governing federal corruption and the abuse of office as well as of the Constitution and Bill of Rights. Through these actions, the named defendants have laid the groundwork for mass genocide.

Using the "swine flu" as a pretext, the defendants have preplanned the mass murder of the U.S. population by means of forced vaccination. They have installed an extensive network of FEMA concentration camps and identified mass grave sites, and they have been involved in devising and implementing a scheme to hand power over the U.S. to an international crime syndicate that uses the UN and WHO as a front for illegal racketeering influenced organized crime activities, in violation of the laws that govern treason.

She further charges that the complex of pharmaceutical companies consisting of Baxter, Novartis and Sanofi Aventis are part of a foreign-based dual purpose bioweapons program, financed by this international criminal syndicate and designed to implement mass murder to reduce the world's population by more than 5 billion people in the next ten years. Their plan is to spread terror to justify forcing people to give up their rights, and to force mass quarantine in FEMA camps. The houses, companies and farms and lands of those who are killed will be up for grabs by this syndicate.

By eliminating the population of North America, the international elite gain access to the region's natural resources such as water and undeveloped oil lands. And by eliminating the U.S. and its democratic constitution by subsuming it under a North American Union, the international crime group will have total control over North America.

Highlights from the complete dossier

The complete dossier of the June 10th action is a 69-page document presenting evidence to substantiate all charges. This includes:

Factual background that delineates time lines and facts that establish probable cause, UN and WHO definitions and roles, and history and incidents from the April, 2009 "swine flu" outbreak.

Evidence the "swine flu" vaccines are defined as bioweapons as delineates in government agencies and regulations classifying and restricting vaccines, and the fear of foreign countries that "swine flu" vaccines will be used for biological warfare.

Scientific evidence the "swine flu" virus is an artificial (genetic) virus.

Scientific evidence the "swine flu" was bioengineered to resemble the Spanish flu virus of 1918 including quotes from *Swine Flu 2009 is Weaponized 1918 Spanish Flu* by A. True Ott, Ph.D., N.D., and a *Science Magazine* report from Dr. Jeffrey Taubenberger et.al.

The genome sequence of the "swine flu"

Evidence of the deliberate release of the "swine flu" in Mexico.

Evidence as to the involvement of President Obama that delineates his trip to Mexico which coincided with the recent "swine flu" outbreak and the death of several officials involved in his trip. Contention is made that the President was never tested for "swine flu" because he had been previously vaccinated.

Evidence as to the role of Baxter and WHO in producing and releasing pandemic virus material in Austria includes a statement from a Baxter official stating the accidentally distributed H5N1 in the Czech Republic was received from a WHO reference center. This includes delineation of evidence and allegations from Burgermeister's charges filed in April in Austria that are currently under investigation.

Evidence Baxter is an element in a covert bioweapons network

Evidence Baxter has deliberately contaminated vaccine material

Evidence Novartis is using vaccines as bioweapons

Evidence as to WHO's role in the bioweapons program

Evidence as to WHO's manipulation of disease data in order to justify declaring a Pandemic Level 6 in order to seize control of the USA.

Evidence as to the FDA's role in covering up the bioweapons program

Evidence as to Canada's National Microbiology Lab's role in the bioweapons program.

Evidence of the involvement of scientists working for the UK's NIBSC, and the CDC in engineering the "swine flu".

Evidence vaccinations caused the Spanish killer flu of 1918 including belief of Dr. Jerry Tennant that the widespread use of aspirin during the winter that followed the end of World War I could have been a key factor contributing to the earlier pandemic by suppressing the immune system and lowering body temperatures, allowing the flu virus to multiply. Tamiflu and Relenza also lower body temperatures, and therefore can also be expected to contribute to the spread of a pandemic.

Evidence as to manipulation of the legal framework to allow mass murder with impunity.

Constitutional issues: the legality vs. illegality of jeopardizing the life, health and public good by mass vaccinations.

The issue of immunity and compensation as evidence of intent to commit a crime.

Evidence as to the existence of an international corporate crime syndicate.

Evidence of the existence of the "Illuminati".

Evidence as to the depopulation agenda of the Illuminati/Bilderbergs and their involvement in the engineering and release of the artificial "swine flu" virus.

Evidence that weaponized flu was discussed at the annual Bilderberg meeting in Athens from May 14-17, 2009, as part of their agenda of genocide, including a list of attendees who, according to a statement once made by Pierre Trudeau, view themselves as genetically superior to the rest of humanity.

Media is keeping Americans clueless about the threat they are under

Jane Burgermeister is a dual Irish/Austrian who has written for *Nature*, the British Medical Journal, and *American Prospect*. She is the European Correspondent of the *Renewable Energy World* website. She has written extensively about climate change, biotechnology, and the ecology.

In addition to the charges currently under investigation that she filed against Baxter AG and Avir Green Hills Biotechnology in April, she has filed charges against WHO and Baxter among others concerning a case of exploding "swine flu" vials meant for a research lab on a busy IC train in Switzerland.

In her view, control of the media by the ruling elite has allowed the world crime syndicate to further its agenda unabated while the rest of the people remain in the dark about what is really going on. Her charges are an attempt to get around this media control and bring the truth to light.

Her greatest concern is that "in spite of the fact Baxter has been caught red handed nearly triggering pandemic, they are also moving ahead, together with allied pharma companies, with supplying the vaccine for pandemics." Baxter is hurrying to get this vaccine to market some time in July.

Jane Burgermeister

About my being fired yesterday

Bird Flu 666, 1 July 2009

https://web.archive.org/web/20090704055256/http://birdflu666.wordpress.com/2009/07/01/about-my-being-fired-yesterday/

On Monday, I was unexpectedly fired from my job as European Correspondent of the Renewable Energy World website.

Because there is reason to believe this decision was related to my filing charges alleging bioterrorism against the people of the USA and the rest of the world, and because I am entitled as a citizen to report a crime if there is credible evidence, I intend to file a lawsuit against Pennwell, a magazine company that covers the oil and defense industries and which took over REW in 2007 after I began working there, for unfair dismissal.

I have heard of other journalists fired or harrassed for covering this subject.

Help strike a blow for freedom of the press and for legal action to stop this kind of pressure being applied to journalists, and donate to:

Бизнес на пандемии. Паника, вызванная вирусом свиного гриппа A/H1N1, обернулась колоссальными доходами для транснациональных фармацевтических гигантов

Огонек, 6-12 июля 2009, № 8, с. 44-46 // Коммерсантъ, 6 июля 2009
https://magzdb.org/file/187766/dl
https://www.kommersant.ru/doc/1194576

...

Baxter Pharmaceuticals Inc., связанная с Минобороны США, которая пару лет назад уже разрабатывала вакцину против птичьего гриппа, в связи с чем получила эксклюзивное право на распространение вакцины в 18 странах мира, включая Европу.

Результатом же опытов стал грандиозный скандал, когда в Австрию и Чехию для клинических испытаний пришли образцы вакцин от обычного гриппа, зараженные птичьим штаммом H5N1. Комбинация этих двух вирусов могла бы привести к появлению нового "птичьего вируса, который мог бы передаваться от человека к человеку.

И снова расследование этого инцидента было замято при помощи ВОЗ, а ответственность за загрязнение вакцины возложили на лабораторных техников, мол, они там что-то случайно напутали.

...

ALLES SCHALL UND RAUCH

Wurde Jane Bürgermeister wegen ihrer Bioterroranzeige entlassen?

Alles Schall und Rauch, 15 Juli 2009, 12:03
http://alles-schallundrauch.blogspot.com/2009/07/wurde-jane-burgermeister-wegen-ihrer.html

Die kritische Journalistin Jane Bürgermeister, welche eine Anzeige gegen die WHO, Firma Baxter und dem Nationalen Zentrum für Influenza in Genf bei der österreichischen Staatsanwaltschaft eingereicht hat, wurde von ihrer Stelle als europäische Korrespondentin der Renewable Energy World Webseite (REW)entlassen. Auf ihrem Blog schreibt sie, nach ihrer Meinung hängt das mit ihrer Anzeige wegen Bioterrorismus mit Schweingrippeviren gegen die Weltgemeinschaft zusammen. Sie will sich mit einer Klage gegen die Firma Pennwell, ein Zeitschriftzenverlag der über die Öl- und Waffenindustrie berichtet und REW im Jahre 2007 übernommen hat, wegen ungerechfertigter Entlassung wehren.

Am 28. April 2009 berichtete ich hier über die Explosion eines Behälters mit Schweinegrippe-Viren im Intercity in der Nähe von Freiburg (Schweiz).
https://web.archive.org/web/20090501104506/http://alles-schallundrauch.blogspot.com/2009/04/doktor-ron-paul-uber-die-schweinegrippe.html
Basierend auf diesem Ereignis hat Jane Bürgermeister folgende Anzeige erstattet:

"Ich bin Österreichische Staatsbürgerin und in der Schweiz, in Zürich, geboren, und möchte eine Anzeige gegen The World Health Organisation, mit Sitz in Geneva,

und, Baxter AG, mit Sitz in Volketswil bei Zürich, die österreichische Tochtergesellschaft des Pharmaunternehmens Baxter International, mit Sitz in Deerfield, IL, USA,

und, Baxter International aufgrund Gefährdung des Lebens und der Gesundheit der Passengieren des Intercity Zuges 730 St Gallen – Zürich erstatten.

Ich behaupte, WHO und Baxter und ihre Partner Labors und Organisationen haben am Montag 27. April rechtswidrig, willentlich und wissentlich, unter Verwendung manipulativer und betrügerischer Kunstgriffe, gegen nationale und internationale Gesetze zur Herstellung, Besitz, Verbreitung und Einsatz biologischer Massenvernichtungswaffen und Gesetze zur organisierter Kriminalität, eine biologische
Agent hergestellt und unter die Passagiere verteilt mit der Absicht eine tödliche Pandemie in der Schweiz auszulösen."

Hier kann man die ganze Anzeige lesen. Anzeige, gegen
World Health Organisation, und Baxter, und Nationalen Zentrums für Influenza, Genf
https://web.archive.org/web/20090704173334/http://wakenews.net/Microsoft_Word__Anzeige_Schweiz.pdf

Am 5. März 2009 berichtete ich hier über die Firma Baxter in Österreich, die in ihren Labors einen Grippeimpfstoff mit Killerviren verseucht und in Umlauf gebracht hat. Wegen diesem Vorfall erstatte Jane Bürgermeister am 1. April folgende Anzeige:
"Anzeige gegen Baxter AG, Baxter International, und Avir Green Hills Biotechnology AG wegen der Entwicklung, Herstellung, Verbreitung und dem Einsatz von biologischen Massenvernichtungswaffen auf österreichischen Boden in den Jahren 2008 und 2009 mit der Absicht eine globale Vogelgrippe Pandemie auszulösen und sich dadurch zu bereichern aufgrund einer Handlung die auch gegen Gesetze der internationalen organisierten Kriminalität und Völkermord verstösst."

Die ganze Anzeige gibts hier. Anzeige Gegen
Baxter AG, Baxter International, und Avir Green Hills Biotechnology AG Wegen Der Entwicklung, Herstellung, Verbreitung und Dem Einsatz Von Biologischen Massenvernichtungswaffen auf Österreichischen Boden in Den Jahren 2008 UND 2009
https://web.archive.org/web/20090711092637/http://wakenews.net/Microsoft_Word__Anzeige_Vogelgrippe.pdf

Dann hat sie richtig losgelegt und vor einem amerikanischen Gericht noch Anzeige wegen Bioterror gegen Präsident Barack Obama, David Nabarro (UNO-Koordinator für Avian und Grippe), Dr. Margret Chan (Chefin WHO), Kathleen Sibelius (Chefin Gesundheitsbehörde), Janet Napolitano (Chefin Heimatschutzbehörde), Dr. Margret Hamburg (Chefin Drogenbehörde), Robert Parkinson (Chef Baxter), Daniel Vasella (Chef Novartis), Chris Viehbacher (Chef Sanofi Aventis), Andrew Witty (Chef GSK Plc), Rahul Singhvi (Chef Novavax), David de Rothschild (Partner Rothschild Bank), David Rockefeller (Trilateral Commsission), Georg W. Bush, George Soros (Chef Soros Fund) und Bill Gates (ex Microsoft Chef, Bill und Melinda Gates Foundation) erstattet.

Sie behauptet: "Weil es Verdachtsmomente gibt, die Beschuldigten sind Teil eines internationalen kriminellen Syndikats, welches Biowaffen (Grippe) entwickelt, produziert, gelagert und eingesetzt hat, um die Weltbevölkerung zu reduzieren."

Die ganze Anzeige kann man hier lesen.
Criminal charges regarding flu pandemic as a biological weapon with intent to produce genocide
https://web.archive.org/web/20091015171300/http://wakenews.net/Microsoft_Word__Criminal_Charges__Swine_flu_edits_v2_1_.pdf

Zu ihrer Entlassung sagt Jane, sie hätte von andern Journalisten gehört, die ebenfalls unter Druck gesetz und gefeuert wurden, weil sie über dieses Thema berichtet haben.

Anfrage im österreichischen Parlament

Hier der Link zur parlamentarischen Anfrage wegen des Vorfalls bei Baxter Österreich.
https://web.archive.org/web/20150115010153/http://www.parlament.gv.at/PAKT/VHG/XXIV/J/J_01437/fnameorig_153739.html
Hier der Link zur Antwort des Bundesministeriums für Gesundheit.
https://web.archive.org/web/20090704023715/http://www.parlament.gv.at/PG/DE/XXIV/AB/AB_01457/fnameorig_158854.html

Darin wird bestätigt, der Fall ist tatsächlich so abgelaufen wie ich am 5. März berichtet habe. Es fand ein Kontamination von 72 Kilo Impfstoff mit Vogelgrippe-Virus (Influenza A/H5N1) statt. Es wird aber die ganze Sache verharmlost und nur von "zu Forschungszwecke bestimmtes Material" gesprochen, welches in der Zwischenzeit vernichtet wurde.

Die Einstellung und Massnahmen des österreichischen Gesundheitsministeriums sind gelinde gesagt sehr unbefriedigend, wenn nicht sehr bedenklich. Es wird nicht die Frage gestellt, warum vermischt die Firma Baxter einen Grippeimpstoff mit Vogelgrippeviren zu angeblichen Forschungszwecke? Was forschen sie denn da in ihrem Labor? Eine Biowaffe? Und dann noch ca. 72 Liter davon? Wie viele Dosen kann man damit produzieren? Bei Tamiflu besteht eine Dosis aus 72 mg. Das wären ja dann 72'000 ml durch 72 ml ist gleich genau 1'000 Dosen!!!

SCOOP Politics

Official Information Act Request To Minister

SCOOP Politics, 2 August 2009, 12:44 pm;
Press Release: The Water Pressure Group
https://www.scoop.co.nz/stories/PO0908/S00001.htm

1 August 2009
Open Letter/Official Information Act Request To NZ Minister Of Health
Tony Ryall:

Dear Minister,
Thank you for your reply dated 21 July 2009.

"Office of Hon Tony Ryall
Minister of Health
...
Dear Ms Bright
Thank you for your email of 11 July 2009 about influenza A (H1N1) 'Swine Flu'.
It is our current view that the Baxter vaccine will need to be proven and licensed before it can be used in New Zealand.

Yours sincerely,

Hon Tony Ryall
Minister of Health"

---------- Forwarded message ----------
From: Richard Taylor (MIN)
Date: Tue, Jul 21, 2009 at 9:27 AM
Subject: Your correspondence with Hon Tony Ryall
To: "waterpressure@gmail.com"

Dear Ms Bright
Please find attached a response to your correspondence with Hon Tony Ryall.
Yours sincerely

Richard Taylor | Office of Hon Tony Ryall
Private Secretary - Health

. . . .

QUESTION #2:

In light of the fact that Baxter International, the company making the Swine Flu vaccine has ADMITTED contaminating the vaccine with live Bird Flu viruses, and is currently under police investigation for possible bioterrorism, how can the Minister have any confidence in the quality of any vaccine coming from this company?

Baxter admits flu product contained live bird flu virus
http://www.ctv.ca/servlet/ArticleNews?hub=Health

Feb. 27 2009
The Canadian Press

TORONTO – The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses.

And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

"At this juncture we are confident in saying that public health and occupational risk is minimal at present," medical officer Roberta Andraghetti said from Copenhagen, Denmark.

"But what remains unanswered are the circumstances surrounding the incident in the Baxter facility in Orth-Donau."

The contaminated product, a mix of H3N2 seasonal flu viruses and unlabelled H5N1 viruses, was supplied to an Austrian research company. The Austrian firm, Avir Green Hills Biotechnology, then sent portions of it to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by the four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died. Ferrets shouldn't die from exposure to human H3N2 flu viruses.

Public health authorities concerned about what has been described as a "serious error" on Baxter's part have assumed the death of the ferrets meant the H5N1 virus in the product was live. But the company, Baxter International Inc., has been parsimonious about the amount of information it has released about the event.

CTVNews/20090227/Bird_Flu_090227/20090227?hub=Health

On Friday, the company's director of global bioscience communications confirmed what scientists have suspected.

"It was live," Christopher Bona said in an email.

The contaminated product, which Baxter calls "experimental virus material," was made at the Orth-Donau research facility. Baxter makes its flu vaccine – including a human H5N1 vaccine for which a licence is expected shortly – at a facility in the Czech Republic.

People familiar with biosecurity rules are dismayed by evidence that human H3N2 and avian H5N1 viruses somehow co-mingled in the Orth-Donau facility. That is a dangerous practice that should not be allowed to happen, a number of experts insisted.

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences.

While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people

That mixing process, called reassortment, is one of two ways pandemic viruses are created.
There is no suggestion that happened because of this accident, however.

"We have no evidence of any reassortment, that any reassortment may have occurred," said Andraghetti.
"And we have no evidence of any increased transmissibility of the viruses that were involved in the experiment with the ferrets in the Czech Republic."

Baxter hasn't shed much light – at least not publicly – on how the accident happened. Earlier this week Bona called the mistake the result of a combination of "just the process itself, (and) technical and human error in this procedure."
He said he couldn't reveal more information because it would give away proprietary information about Baxter's production process.

Andraghetti said Friday the four investigating governments are co-operating closely with the WHO and the European Centre for Disease Control in Stockholm, Sweden.

"We are in very close contact with Austrian authorities to understand what the circumstances of the incident in their laboratory were," she said.

"And the reason for us wishing to know what has happened is to prevent similar events in the future and to share lessons that can be learned from this event with others to prevent similar events. ... This is very important."

Yours sincerely,

La grippe h1n1 est – elle une menace pour La Martinique?

Rédigé le Vendredi 14 Août 2009 à 08:19
https://www.makacla.com/LA-GRIPPE-H1N1-EST-ELLE-UNE-MENACE-POUR-LA-MARTINIQUE_a407.html

Les responsables de la santé dans nos régions semblent prendre la chose à la légère, mais au niveau mondial des scientifiques parlent de génocide de masse organisé par des sociétés pharmaceutiques.

Une journaliste scientifique autrichienne Jane Burgermeister prévie nt le monde entier que le plus grand crime de l'histoire de l'humanité est en marche.

Elle a récemment déposé une plainte contre l'OMS (Organisation Mondiale de la Santé), l'ONU, Barak Ozama (Président des Etats-Unis), David de Rothschild (banquier), David Rockefeller (banquier), George Sorgos (banquier), Werner Farman (Chancelier d'Autriche). Jane Burgermeister accuse également, parmi d'autres, le Dr Margaret Chan, Directrice de l'OMS, Bill Gates et George W. Bush., entre autres, les accusant de vouloir commettre un génocide de masse.

Cette plainte fait suite à une autre procédure judiciaire que la journaliste avait intentée en Avril 2009 contre les sociétés pharmaceutiques Baxter et Avoir Green Hill Technologie, qu'elle juge responsable d'avoir produit un vaccin contre la grippe aviaire, pour délibérément provoquer une pandémie et s'enrichir par la même occasion.

Jane Burgermeister présente les preuves d'actes de bioterrorisme dans lesquels ces personnes. Et organismes précités sont impliqués.

Elle les accuse de faire partie d'un syndicat international d'entreprises criminelles qui a mis au point, fabriqué, stocké et utilisé des armes biologiques en vue d'éliminer la population des Etats-Unis, la France et l'Europe sont bien sûr concernées, et celle d'autres pays à des fins de gains politiques et financiers.

Utilisant la «grippe porcine» comme prétexte, elle les accuse d'avoir planifié le meurtre de. Masse de la population américaine par le biais de la vaccination forcée.

Elle a les preuves que ces vaccins seront volontairement contaminés pour provoquer à dessein des maladies mortelles.

Ces exactions s'inscrivent en violation directe de la Loi antiterroriste concernant l'emploi d'armes biotechnologiques. Elles constituent des actes de terrorisme et de haute trahison. « Il faut prendre des mesures draconiennes.

LA VANGUARDIA

Una monja médica hace campaña por internet en contra de que la vacuna contra la gripe A sea obligatoria

La Vanguardia, 7 de octubre de 2009
https://www.lavanguardia.com/vida/20091007/53800182804/una-monja-medica-hace-campana-por-internet-en-contra-de-que-la-vacuna-contra-la-gripe-a-sea-obligato.html

Teresa Forcades, una benedictina doctora en medecina, llama al boicot a la vacunación por considerarlo una imposición innecesaria y que favorece a la industria farmacéutica.

Barcelona.f (EFE).- Teresa Forcades, una monja benedictina doctora en medicina, ha iniciado un movimiento ciudadano en Internet para impedir que la vacuna contra la gripe AH1N1 sea obligatoria debido a la declaración de pandemia por parte de la OMS, y en contra la gestión de la enfermedad.

En un vídeo que ha colgado en la red, la monja hace un llamamiento para activar con carácter urgente los mecanismos legales de participación ciudadana para que no se pueda forzar a nadie en España a ser vacunado, y para que los que lo hagan no se queden sin el derecho a exigir responsabilidades si causa efectos secundarios.

El vídeo explica que desde el año 2005 la Organización Mundial de la Salud (OMS) puede dar órdenes a los gobiernos sobre vacunas en casos de pandemia, y que si esto ocurre el estado tiene la obligación de hacer cumplir la ley imponiendo multa o prisión (en Massachussetts -EEUU- la multa propuesta para este caso podría llegar a los 1.000 dólares por día que pasa sin que te vacunes).

Forcades recuerda que "la gripe nueva" no es nueva porque sea del tipo A, ni tampoco por ser del subtipo H1N1, porque la epidemia de gripe de 1918 fue del tipo A/H1N1 y porque desde 1977 los virus A/H1N1 forman parte de la temporada de gripe de cada año, y puntualiza que lo único que es nuevo es la cepa S-OIV.

Añade que desde que empezó en abril de 2009 y hasta el 15 de septiembre de 2009 han muerto de esta gripe 137 personas en Europa y 3.559 en todo el mundo, cuando debido a la gripe estacional lo hacen entre 40.000 y 220.000 personas, lo que supone que la tasa de mortalidad y de complicaciones es inferior a la de cada año.

La religiosa denuncia además irregularidades en la elaboración de la vacuna y explica cómo en enero del 2009 la filial austríaca de la farmacéutica Baxter distribuyó a 16 laboratorios de Austria, Alemania, la República Checa y Eslovenia 72 kilos de material para hacer miles de vacunas contra la gripe estacional, que resultó contener virus vivos de la gripe aviar (virus A/H5N1) con virus vivos de la gripe de cada año (virus A/H3N2).

El descubrimiento se hizo cuando un técnico de laboratorio de la empresa BioTest de la República Checa probó por su cuenta las vacunas en hurones, animales que se usan para estudiar las vacunas de la gripe, y comprobar que todos ellos murieron.

Explica que si esta contaminación no se hubiese descubierto a tiempo, la pandemia que sin base real están anunciando las autoridades de la OMS y los países "sería una espantosa realidad", porque sería letal combinar un virus con un 60% de mortalidad pero poco contagioso como el aviar, con otro con baja mortalidad pero gran capacidad de contagio, como el de la gripe estacional.

También cuenta cómo sólo 12 días después de aparecer los primeros casos, la OMS declaró que el nivel de alerta por peligro de pandemia estaba en fase 5 y ordenó a los gobiernos que activasen planes de emergencia, y un mes después declaró que ya había una pandemia, cuando la nueva gripe es más benigna que la estacional.

La médico relata que esta declaración de pandemia (fase 6) fue posible porque en mayo la OMS cambió la definición de pandemia. Antes para poder hacerlo era necesario que muriese a causa de un agente infeccioso una proporción significativa de la población, un requerimiento que fue eliminado de la definición.

Sobre la vacuna, la religiosa alerta de que la mayoría de los laboratorios diseñan vacunas en dos dosis, que deben sumarse a la vacuna de gripe estacional, algo que nunca se ha hecho y que multiplica por tres los posibles efectos secundarios.

También revela que los laboratorios que hacen vacunas usan coadyuvantes muy potentes para estimular el sistema inmunitario, y que la que está fabricando Glaxo-Smith-Kline contiene uno llamado AS03, que multiplica por diez la respuesta inmunitaria, que podría provocar enfermedades auto inmunitarias graves al cabo de un tiempo.

Además hace público que las farmacéuticas que fabrican la vacuna están exigiendo a los estados que firmen acuerdos de inmunidad para que en caso de que las vacunas tengan más efectos secundarios de los previstos, los políticos y la industria quede exenta de toda responsabilidad. Teresa Forcada es autora de "Los crímenes de las grandes compañías farmacéuticas", en donde explica cómo el poder político y económico que han adquirido les sirve para garantiza unos enormes beneficios económicos, aún a costa de la salud de la población.

Utilisant la «grippe porcine» comme prétexte, elle les accuse d'avoir planifié le meurtre de masse de la population américaine par le biais de la vaccination forcée. Elle a les preuves que ces vaccins seront volontairement contaminés pour provoquer à dessein des maladies mortelles.

Ces exactions s'inscrivent en violation directe de la Loi antiterroriste concernant l'emploi d'armes biotechnologiques. Elles constituent des actes de terrorisme et de haute trahison.

Jane Burgermeister. Vaccination genocide

Austrian investigative journalist Jane Burgermeister has filed criminal charges against the World Health Organization (WHO), the United Nations (UN), and several of the highest ranking government and corporate officials, charging them with bioterrorism and attempts to commit genocide.

In April, she filed charges against Baxter AG and Avir Green Hills Biotechnology of Austria for producing and releasing live bird flu virus', alleging it was a deliberate act to cause and profit from a pandemic.

When a Czech scientist tested their seasonal flu vaccine, he found that they contained live H5N1 and live H3N2 viruses. Burgermeister's charges include evidence that Baxter deliberately sent out 72 kilos of live bird flu virus, supplied by the WHO in the winter of 2009.

She claims to have decisive proof that drug companies and government agencies are actively engaged in distributing deadly biological agents in order to trigger a pandemic.

She has also prepared an injunction against forced vaccination, alleging mandatory vaccines will be purposely contaminated with diseases.

Live Avian flu with 60% death-rate "accidentally" put in US company's test vaccine material

eXaminer, 10 October 2009, 9:42 PM

US pharmaceutical company Baxter admitted to distributing active Avian flu H5N1 in test vaccine material that were sent to 18 laboratories in four countries. H5N1 flu is the world's deadliest, with a mortality rate of over 60% according to the World Health Organization (WHO). H5N1 "has caused the largest number of detected cases of severe disease and death in humans" of all known flu types, according to the Centers for Disease Control (CDC). While H5N1 is not highly transmittable, it was mixed with H3N2, a highly contagious form of human flu. This potential pandemic was averted in March when alert researchers discovered the equivalent of a biological weapon that could quickly kill over two billion people, according to published data in *American Scientist*, a leading journal. An August 2009 analysis in the *Journal of Virology,* "Reassortment between Avian H5N1 and Human H3N2 Influenza Viruses in Ferrets: a Public Health Risk Assessment," confirms that the mix of H5N1 and H3N2 did indeed combine the two into a form that could be as deadly as H5N1 and as transmittable as H3N2.

Baxter Manager of Communications, Jutta Brenn-Vogt, at Baxter Deutschland stated the vaccine component was "experimental virus material."

Most Americans are unaware of this story, as mainstream media largely failed to report it (see here, here and here).

Experts stated that contamination of vaccines with live virus is impossible through an accident because of strict BSL3 protocol (Biosafety level 3). Pathogenic and potentially lethal agents are always contained and fully supervised. This means that either BSL3 protection was ignored by Baxter, or that "vaccines" were created as lethal biological weapons.

Our US government's response was to quickly grant immunity to vaccine manufacturers and related government officials from any lawsuits for damages. Health and Human Services Secretary Kathleen Sebelius is repeatedly calling on Americans to take the current version of the vaccine, promising it to be "safe and secure." The World Health Organization declared a "Level 6 pandemic" in June which allows governments to use martial law with deadly force in requiring total public vaccinations (and here). The US is in treaty obligation to obey WHO if they order universal vaccination.

Legal and medical professionals have taken the above information and composed a criminal complaint available to everyone to request protection from local courts if forced vaccinations are ordered. In surveys, less than half of American, Canadian, and UK health care workers will accept the vaccine, and only about one-third of US parents plan to vaccinate their children.

Below is 2-minute video and then an extensive interview with Jane Burgermeister, a medical editor with academic training in biosafety who explains why an accident in handling H5N1 is impossible, and that this was a biological attack. She also explains that this new flu scare is a continuation of that plan. The most popular hypothesis to explain this event as an intentional attack is agreement among the highest level of government and economic leaders to massively reduce earth's population. The source of the interview is Project Camelot.

Ваксините са много повече цифрови от свински грип
Масова ваксинация: съставки при катастрофи
BgKoshachek, 19 октомври 2009
https://bg.koshachek.com/articles/ne-na-vaksinite-vaksinite-mnogo-poveche-smertno-ot.html

(от д-р Mae-Wan Ho и проф. Joe Cummins от Института за наука в обществото)

През април 2009 г. имаше огнище на свински грип в Мексико и Съединените щати, който бързо се разпространи по целия свят и се разпространи сред хората. Съдейки по първите данни, публикувани през май, новият тип грип A/H1N1 се различава от всеки друг тип, регистриран досега.

Това е странна комбинация от последователности на вирусни щамове от птичи, човешки и свински грип от Северна Америка и Евразия. Изтъкнат вирусолог от Канбера каза пред медиите, че вирусът може да е бил създаден в лабораторията и случайно да бъде освободен. Някои анализатори основателно предполагат, без доказателства, които да ги подкрепят, че то е умишлено създадено като биологично оръжие, докато други обвиняват интензивната развъдна индустрия и огромния трафик на животни на дълги разстояния, който предлага много възможности за генериране екзотична рекомбинация.

Това, което най-много притеснява гражданите, обаче са програмите за масова ваксинация, които правителствата подготвят за борба с пандемията, които могат да бъдат по-лоши от самата пандемия. Организация се противопоставя на мълниеносна ваксинация на ученици.

...

През декември клон на Бакстър в Австрия изпрати ваксина срещу човешки грип, заразена с вируса на живата птица H5N1 убиец, до 18 страни, включително Чешката република, където клиничните проучвания показват, че тя е причинила смъртта на инжектирани морски свинчета]. Чешките вестници се усъмниха дали Бакстър умишлено иска да започне пандемия.

...

Франция е поискала ваксини от Sanofi, GSK и Novartis, но не вижда нужда да иска от производителите да намалят или да преминат клинични изпитвания. Sanovi-Aventis, френският производител на фармацевтични продукти, който произвежда собствена ваксина срещу свински грип, трябва да е започнал да тества продукта в началото на август и смята, че се нуждае от два месеца и половина експерименти, преди да може да бъде ваксиниран. ефективно "; според Алберт Гарсия, който говори от името на компанията за ваксини, „ваксината ще бъде готова през ноември или декември“.

Изглежда обаче, че Бакстър е произвел ваксина в началото на август за клинични изпитвания.

Teresa Forcades i Vila

Una reflexión y una propuesta en relación a la nueva gripe (resumen)

Sensibilidad Qquimica Multiple, 23 de octubre de 2009
https://www.sensibilidadquimicamultiple.org/2009/10/
https://web.archive.org/web/20091007183255/http://www.catalunyareligio.cat/documents/REFLEXIONYPROPUESTATERESAFORCADESGRIPENUEVA.doc

...

A finales de enero del 2009, la filial austríaca de la farmacéutica norteamericana Baxter distribuyó a 16 laboratorios de Austria, Alemania, la República Checa y Eslovenia, 72 Kg. de material para preparar miles de vacunas contra el virus de la gripe estacional; las vacunas tenían que ser administradas a la población de estos países durante los meses de febrero-marzo; antes de que ninguna de estas vacunas fuese administrada, un técnico de laboratorio de la empresa BioTest de la República Checa decidió por su cuenta probar las vacunas en hurones, que son los animales que desde 1918 se utilizan para estudiar las vacunas de la gripe; todos los hurones vacunados murieron; se investigó entonces en qué consistía exactamente el material enviado por la casa Baxter y se descubrió que contenía virus vivos de la gripe aviar (virus A/H5N1) combinados con virus vivos de la gripe de cada año (virus A/H3N2); si esta contaminación no se hubiese descubierto a tiempo, la pandemia que sin base real están anunciando las autoridades sanitarias globales (OMS) y nacionales, ahora seria una espantosa realidad; esta combinación de virus vivos puede ser especialmente letal porque combina un virus que tiene un 60% de mortalidad pero es poco contagioso (el virus de la gripe aviar) con otro que tiene una mortalidad muy baja pero con una gran capacidad de contagio (un virus de los de la gripe de cada año)

El 29 de abril del 2009, cuando hacía sólo 12 días que se habían detectado los dos primeros casos de la nueva gripe, la Dra. Margaret Chan, directora general de la OMS, declaró que el nivel de alerta por peligro de pandemia se encontraba en fase 5 y ordenó que todos los gobiernos de los estados miembros de la OMS activasen planes de emergencia y de alerta sanitaria máxima; un mes más tarde, el 11 de junio del 2009, la Dra. Chan declaró que en el mundo ya teníamos una pandemia (fase 6) causada por el virus A/H1N1 S-OIV ; ¿cómo pudo declarar algo así cuando, de acuerdo con los datos científicos expuestos más arriba, la nueva gripe es en realidad más benigna que la gripe de cada año y, además, no es un virus nuevo y ya existe parte de la población que tiene inmunidad?; lo pudo declarar porque en el mes de mayo la OMS había cambiado la definición de pandemia; antes de mayo del 2009 para poder declarar una pandemia era necesario que muriese a causa de un agente infeccioso una proporción significativa de la población; este requerimiento – que es el único que da sentido a la noción clínica de pandemia y a las medidas políticas que se le asocian – fue eliminado de la definición el mes de mayo del 2009 , después que el 26 de abril los EEUU se hubiesen declarado en “estado de emergencia sanitaria nacional”, cuando en todo el país sólo había habido 20 personas infectadas de la nueva gripe y ninguna de ellas había muerto

Windows Bulgaria

Едно от последните интервюта в Проект камелот е с журналистка от Австрия

Windows Bulgaria, 3 ноември 2009
https://windowsbulgaria.com/topic/1100-ah1n1/

Едно от последните интервюта в Проект камелот е с журналистка от Австрия, пишеща статии за медицински списания.

В момента тя е уволнена от работа, защото е поискала да се разследва случая с Baxter от февруари 2009, когато във ваксините за свинския грип е открит активно действащ H5N1. Пробите са разпратени в 18 лаборатории и чехите откриват наличието на птичия грип във ваксината против свински. Журналистката твърди, че Baxter са внесли в Австрия 72 кг H5N1 (птичия грип) и до днес никой не може да потвърди какво смятат да правят с него.

Тя се е запознала с документите как във Франция ще протече ваксинацията.

Skażone szczepionki i lobbing koncernów

TVN24, 10 listopada 2009
https://tvn24.pl/polska/skazone-szczepionki-i-lobbing-koncernow-ra114926-3699892

Jak bezpieczne są szczepionki na grypę? Jeden z koncernów farmaceutycznych wysłał niedawno do Czech materiał badawczy skażony wirusem ptasiej grypy. – Podjęliśmy wszystkie środki zaradcze – tłumaczy firma. Jednak to rządy państw mają brać na siebie odpowiedzialność za ewentualne skutki uboczne szczepionek.

Sprawę szczepionek zbadali dziennikarze programu "Teraz My" w TVN. Na początku roku z fabryki Baxtera pod Wiedniem do kilku laboratoriów w Europie zostały rozesłane próbki zawierające szczep grypy. W sumie 72 kilogramy. Laboratoria miały z nich wyprodukować szczepionki na grypę sezonową.

Jednak w czeskim ośrodku, w trakcie badań okazało się, że zwierzęta testowe zaczęły chorować na ptasią grypę. - Spodziewaliśmy się innego szczepu, musieliśmy je uśpić – mówi.

"Firma Baxter natychmiast podjęła wszystkie niezbędne środki"

W odpowiedzi na pytania "Teraz My" Baxter wystosował krótkie oświadczenie. Pisemnie, bo żaden z pracowników firmy nie chciał wypowiadać się przed kamerą.

Czytamy w nim, że "w jednym z ośrodków badawczych testy laboratoryjne wykazały, że próbki wirusa dostarczone przez firmę Baxter były zanieczyszczone szczepem ptasiej grypy (…) Firma Baxter natychmiast podjęła wszystkie niezbędne środki stosownie do zaistniałej sytuacji oraz rozpoznała i wdrożyła działania korygujące i prewencyjne".

"Przypadek? Na 72 kilogramach?"

Dochodzenie w tej sprawie prowadziła Austriacka Agencja Leków. Uznała, że doszło do błędu, ale nic nikomu nie mogło się stać, bo była to dopiero wczesna faza badań. Innego zdania jest austriacka dziennikarka Jane Burgermeister. Według niej, ze skażonego materiału mogły powstać gotowe szczepionki. - Nie ma mowy, żeby zmieszać wirusa z 72 kilogramami materiału badawczego przez przypadek. Złożyłam zawiadomienie do prokuratury – mówi reporterce programu. Jednak postępowanie zostało umorzone.

Jak mogło dojść do takiej pomyłki i na ile procedury badawcze są bezpieczne? Koncerny na te pytania nie odpowiadają. Musi wystarczyć zapewnienie, że szczepionki – przynajmniej te na świńską grypę – są bezpieczne. I wielu państwom UE to wystarcza: w umowach na dostarczenie leku akceptują klauzulę, że odpowiedzialność za efekty uboczne będzie ponosiło państwo.

Tu wyjątkiem jest Polska. Minister zdrowia Ewa Kopacz domaga się od producentów szczepionek mocniejszych gwarancji.

Skuteczny lobbing koncernów?

Dlaczego firmy zabezpieczają się w ten sposób, skoro szczepionki mają być bezpieczne? Coraz głośniej mówi się o lobbingu, jaki wywierają one na rządy i międzynarodowe organizacje. – Firmy farmaceutyczne są obecne jako obserwatorzy w radzie doradczej przy WHO. Wielu członków tej rady jest też powiązanych z koncernami. Europejska Agencja Medyczna, która zaakceptowała niesprawdzone szczepionki, jest w dwóch trzecich finansowana przez firmy farmaceutyczne – wyjaśnia Burgermeister.

A Claudia Wild z wiedeńskiego Instytutu Ludwiga Boltzmanna dodaje, że WHO niedawno ustawiła nowe, dużo łatwiejsze do spełnienia kryteria do ustanowienia stanu pandemii. - Znalazłam stronę internetową Europejskiej Grupy Badawczej nad Grypą (ESWI), która jest instytucją lobbingową z siedzibą w Brukseli. Mieli sympozjum o przygotowaniu do pandemii grypy już w styczniu tego roku. Co takiego wiedzieli wtedy o świńskiej grypie? – pyta. ESWI na swojej stronie internetowej podaje, że jest doradcą WHO, a wśród jej sponsorów można znaleźć trzech producentów szczepionki na świńską grypę.

Grupa o przygotowaniach do pandemii dyskutowała w styczniu. W kwietniu w Meksyku odkryto A/H1N1. A w czerwcu WHO ogłosiło pandemię. A na pandemii koncerny mogą zarobić miliardy.

Baxter
We turned to Baxter company for some answers.
Baxter limited itself to writen statement that was
sent to us, in which we read among others:

This is a 5 minute material from a TV show called "Teraz my" ("Now us") broadcasted on 9/11/2009 on biggest Polish private station TVN. The program is very respected and has very large audience so this is real mass media in Poland, I mean total mainstream media.

The hosts invited current Polish Health Minister Ewa Kopacz (against the flu), and former Polish Health Minister Marek Balicki.

He kept on saying actually one thing: "but WHO and EMA recommended it, are you trying to be smarter and jeopardize health of millions of Poles?"

Current Minister kept bringing up the issues stated in her appearance in Polish Parliament, you can watch it here: RE: Polish Health ...

Former Minister is either naive or full of shit and made a fool of himself the way he behaved, and she came out really good with the message.

The hosts ended the show with a conclusion that the doubts are very reasonable and that it is disturbing how big pharma and big politics are making big shady businesses above our heads.

It starts becoming a public subject now and it looks really good folks!

THE FLU CASE

Austrian Prosecutors drop case against Baxter

The Flu Case, 11 November 2009, 09:02

https://web.archive.org/web/20100102042942/http://theflucase.com/index.php?option=com_content&view=article&id=1728%3Aaustrian-prosecutors-drop-case-against-baxter&catid=41%3Ahighlighted-news&Itemid=105&lang=en

An *Austrian judicial official* has said today that the Korneuburg State Prosecutor Christian Pawle *has dropped the case against the pharmaceutical company Baxter* and others accused for their roles in contaminating and distributing 72 kilos of seasonal flu vaccine material with the live bird flu virus at its facilities in Orth an der Donau, so nearly triggering a global bird flu pandemic in February, according to the Times of India. The official said that the prosecutor had dropped the charges because there was no evidence a crime had been committed.

I have emailed the Korneuburg State Prosecutor Christian Pawle in charge of the case and asked to see the file of the investigation to understand the basis of his decision. The requirement for Baxter to adhere to biosafety level 3 regulations makes an accidental contamination of 72 kilos virtually impossible. In addition, the labs Avir and BioTest, which received the contaminated material from Baxter, have gone on record saying the end purpose of the contaminated material was for use as normal seasonal flu vaccine casting doubt on claims made by Baxter that it was research material. Also, 36 people had to be treated preventatively for the bird flu in hospitals in Vienna and the Czech Republic because they came into contact with this material underlining its danger.

It will be interesting to see how Pawle justified his decision to drop all charges against Baxter. If he fails to show that he has conducted the requisite inquiriess, gathered adequate information and drawn the right conclusions, he could expose himself to charges of complicity in a crime.

At the beginning of September, the police chief in charge of the anti terrorism unit in Vienna that appeared to be investigating the Baxter case (I was summoned there for an interview) stepped back from his position apparently under pressure. Ernst Geiger, police man with a dubious record and suspended on suspicion of misusing their office returned to a key function in the criminal police after first being floated for this post. “How vigorous an investigation can Geiger be expected to conduct into Baxter, when his former employer, is a close associate of those very globalist pharma companies and banks?” I asked in a report on September 3rd.

In fact, just three weeks later, the Baxter case was dropped in spite of the overwhelming evidence of a deliberate attempt to start a bird flu pandemic that could have killed millions. This news that the prosecutor has dropped the charges comes amid a growing row over the “politicization of the justice system,” as more and more cases where there is strong evidence of a crime fail to be investigated.

A week ago, a British UN nuclear inspector fell to his death from 17 floors in the UN building in Vienna and the Austrian police did not open an investigation even though an autopsy performed on the inspector on the insistence of his partner revealed strangulation marks on his neck and the doctor concluded there were strong indications he had been murdered. It seems that the Austrian police and judicial officials are becoming increasingly complicit in crimes and so are endangering the well being of the people of Austria and of the rest of Europe.

The decision by the State Prosecutor to drop the criminal investigation paved the way for Baxter to get approval for its Celvapan “swine flu” vaccine that is now being pushed on the Austrian people for a mild disease.

Under the Austrian pandemic plan, forced vaccination and quarantine are possible as is the suspension of basic rights.

The Austrian government is hyping the pandemic and pushing people to take the swine flu jab. Can we be so sure there will be no martial law when everything has been prepared by the government for just that? And soon.

We, the people, have to stand up and say: enough is enough of this Mafia-style clique who have taken control of government office and who are misusing that office to enrich themselves with their various schemes, including foisting on us a toxic swine flu jab for an artificially created pandemic.

If the *government and judicial officials do not perform their duties* in office as they are required to do by the Constitution and the law, and if they are even actively engaged in carrying out crimes on a gigantic scale, they must be removed from office by us the people. We, the people, must stand together and bring about a return to Constitution, the rule of law, accountable government and genuine democracy

УКРАЇНСЬКА ПРАВДА

Артем Петренко

Пандемия – природный процесс или заговор?

Українська Правда, 12 ноября 2009, 12:50
https://blogs.pravda.com.ua/authors/petrenko/4afbe87ab2169/

...

В СМИ появилась информация, о том, что якобы в феврале 2009 года австрийская компания – дистрибьютор лекарств "Орта" отправила в Чехию, Словению и Германию партию противогриппозной вакцины, произведенной американской компанией "Бакстер". Лаборант чешской фармацевтической компании "Биотест" проверил американскую вакцину на лабораторных хорьках. Все животные погибли. При анализе вакцины выяснилось, что она содержит в себе живой (активный) "птичий" вирус H5N1 и человеческий – H3N2. Более детальные исследования канадской химлабораторией показали, что компонент H5N1 является чрезвычайно опасным. Именно от такого вируса "птичьего гриппа" гибли люди в разных уголках мира.

На запрос канадских журналистов компания "*Baxter Pharmaseutical International, Inc*.", главный офис которой находится в Дирфильде, штат Иллинойс, отрицала факт своего причастия инциденту. Но под давлением европейских стран вынуждена была признать, что вакцина была разработана в ее лабораториях, однако заражение вакцины вирусом H5N1 могло быть только случайной ошибкой. "Экспериментальный материал был подготовлен специально для лабораторных исследований, не был использован для производства вакцин и не был предназначен для использования на людях", – заявил представитель "Baxter".

Конспирологи успели вписать этот факт в общую теорию заговора против человечества.

Например, в расследовании этого случая участвовала и австрийская журналистка Жане Бургермейстер. В апреле она подала на компанию "Бакстер" иск в австрийский суд. По ее словам, после этого она была уволена с работы. Журналистка открыла специальный сайт www.theflucase.com, где собирает всю информацию о пандемическом заговоре "мировой закулисы". Она утверждает, что это спланированная акция с целью заразить вирусом с помощью вакцинации множество людей по всему миру. Будто конечная цель – после введения чрезвычайного положения, способствовать установлению нового мирового порядка. Якобы ВОЗ подконтрольна организаторам заговора.

Но этот и предыдущие скандалы вокруг этой фирмы не сказались на работе над вакциной против "калифорнийского" гриппа.

AHRCANUM

Baxter Flu Vaccine Contaminated, TV Investigative Report

Ahrcanum, 13 November 2009
https://ahrcanum.com/2009/11/13/baxter-flu-vaccines-contaminated-tv-report/
https://www.youtube.com/watch?v=VX6p-sbbnKs

Baxter Pharmaceutical, makers of H1N1 Swine Flu Vaccines has admitted that they were involved with contaminating vaccines, a **Polish television station has reported**. In May 2009, we reported:

Swine flu vaccines contaminated with avian (bird) flu. Producer admits on Polish TV (TVN).

https://www.youtube.com/watch?v=VX6p-sbbnKs

Baxter sent vaccines contaminated with deadly live H5N1 avian flu virus to 18 countries before someone caught the mistake and the vaccine got injected thousands of people. Baxter just missed creating its own pandemic then by mixing deadly H5N1 virus with a mix of H3N2 seasonal flu viruses, or did they? By possibly creating the pandemic, maybe Baxter already has the cure and that is why WHO has deemed them the appropriate pharmaceutical company to lead the way for a swine flu vaccine. Keep in mind- Just 50 miles from the H1N1 ground zero outbreak in Mexico City, lies Baxter's manufacturing plant in Cuernavaca, Mexico.

Is the H1N1 Swine Flu the excuse that pharmaceutical companies needed to sell vaccines that were patented well before the outbreak occurred? Like Sarah Palin, we might say, "You Betcha." The rush for approval based on previous manufacturing process is nothing short of a ploy for the probability that it is a weapon for population reduction. Targeting pregnant women and young children first, they are being injected with toxic laden chemicals including spermicides to inhibit future fertility.

...

Likely no press in the U.S. will ever investigate or make the connections that we have tried to make, and authenticate here at Ahrcanum. Sad to see Lou Dobbs go, he would have been the one person left who could have presented this to the American people. Jane Burgermeister's claim to Austrian authorities regarding a vaccine 'conspiracy' has been apparently dismissed. What is not so easily dismissed, is that citizens from Poland to the four corners of the world are beginning to take notice and refuse to vaccinate. Funny how all the vaccine manufactures are immune from lawsuits in the U.S.

Jane Burgermeister

Investigating the Swine Flu Pandemic

Wake Up Call Conference 5, BBC5 TV,12 December 2009
http://www.stolenelectionnovella.com/jane-burgermeister-warned-us.html

Bioterrorism Evidence

Evidence that an international corporate criminal syndicate, which has annexed high government office inside the United States, is intent on carrying out a mass genocide against the people of the United States by using an artificial (genetic) flu pandemic virus and a forced vaccination program to cause mass death and injury and depopulate America in order to transfer control of the United States to WHO, the UN and affiliated security forces (UN troops from countries such as China, Canada, the UK and Mexico etc). See this document here

https://web.archive.org/web/20090704180537/http://wakenews.net/Evidence_of_the_use_of_pandemic_flu_to_depopulate_USA.pdf
https://web.archive.org/web/20090601000000*/http://wakenews.net/Evidence_of_the_use_of_pandemic_flu_to_depopulate_USA.pdf
https://sites.google.com/site/mrmetanoja/genetsko-oruzje?tmpl=%2Fsystem%2Fapp%2Ftemplates%2Fprint%2F&showPrintDialog=1

(pp. 31-36):

VII. Evidence as to the role of Baxter and WHO in producing and releasing pandemic virus material in Austria.

Baxter Pharmaceutical http://www.baxter.com/ has been chosen by the WHO to lead the efforts in finding a vaccine cure for the swine flu H1N1 virus.

Baxter AG, headquartered in Vienna, and the Austrian subsidiary of the pharmaceutical company Baxter International, headquartered in Deerfield, IL, USA, sent vaccine material contaminated with deadly live H5N1 bird flu virus to 16 laboratories in four countries in winter 2009 before a technician caught the mistake.

The deadly mixture of live bird flu virus and human flu virus were mixed in a biosecurity level 3 facility, where basic protocol and procedures would make it impossible to ever mix a live virus bioweapon with vaccine material by accident. In the first place, the strain of bird flu that is lethal to humans has no place in the the Baxter facility in Austria. So what was it doing in the facility designed for research into normal flu viruses and vaccines and their production to begin with?

The material released was a combination H3N2 seasonal flu viruses and live, unlabeled H5N1 viruses. If both strains were to incubate and recombine in a human host, a virulent airborne weapon that would cause a pandemic would be released, potentially killing billions.

The Baxter facility did not radiate the material before they sent it out, leaving the deadly virus alive.

To sum up,Baxter International, a global pharmaceutical corporation that has secured lucrative contracts to supply bird flu vaccines in pandemic, mixed live bird flu with human flu vaccine material in a Biosecurity level -3 facility, fail to radiate it and sent it under a false label to 16 labs as vaccine material.

About eight weeks later, a artitificial, genetic worldwide interspecies flu pandemic breaks out in Mexico City, close to another Baxter facility, and the same company is given government and WHO contracs to produce vaccines for the outbreak.

According to Austrian Health Minister Alois Stöger, 72 kilograms of vaccine material was contaminated with the live bird flu virus which WHO supplied.
http://www.parlament.gv.at/PG/DE/XXIV/AB/AB_01457/fnameorig_158854.html
Parliamentary answers 1457/AB (XXIV. GP) May 20th, 2009,

Fragen 14 und 15:
Das für Forschungszwecke bestimmtes Material -72 kg waren als kontaminiert anzusehen – wurde in die Firma zurück geholt und kontrolliert vernichtet.“

It is still not clear how 72 kilograms of the world’s deadliest bioweapon can be sent by accident from a high biosecurity facilities, not irradiated and under a false label.

However, we know from Baxter itself that it produced the 72 kilograms contaminated material using a wild type live bird flu virus obtained from the WHO reference center.
http://www.promedmail.org/pls/otn/f?p=2400:1001:53103::NO::F2400_P1001_BACK_PAGE,F2400_P1001_PUB_MAIL_ID:10001,76322

A statement on behalf of Baxter

I would like to provide the following update to a posting on ProMED dated 25 Feb 2009 (Avian influenza, accidental distribution – Czech Rep. ex Austria: RFI).
The H5N1 strain was the A/Vietnam/1203/2004 strain, received from a WHO reference centre. All information concerning this incident has been provided to the involved national authorities and appropriate international bodies such as ECDC and WHO.
--
Christopher Bona
Director, Global BioScience Communications

Deerfield, IL 60015
<christopher_bona@baxter.com>

Also, Baxter is the only flu vaccine manufacturer to work with wild type flu viruses, felt to be more dangerous than the altered and attenuated (weakened) viruses other manufacturers use.
http://chealth.canoe.ca/channel_health_news_details.asp?news_id=27436&news_channel_id=1020&channel_id=1020

The Austrian police have launched an investigation into the incident that almost triggered a global pandemic. The mixture of the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is classified as one of the most deadly bioweapons in the world with a mortality rate of 63 per cent.

So, with the Baxter incident in Austria, there is proof that Baxter not only created flu material with help from WHO, but also distributed them in large quantities to trigger a pandemic, while also positioning themselves to produce the vaccine allegedly to "protect" against the virus they created and released.

In criminal charges filed against Baxter on April 8th, 2009 at the Vienna City Prosecutor's office, Landesgerichtstr 11, 1080 Vienna, Austria, it was alleged that Baxter unlawfully, wilfully and knowingly, in the period between December 2008 and February 2009, employed manipulative and deceptive devices and contrivances in violation of national and international laws on the manufacturing, possession, release and dissemination of biological weapons of mass destruction and on organised crime, to manufacture and distribute a biological agent that is classified as a bioweapon among the population in order to profit from the pandemic.

First, Baxter manufactured influenza material contaminated with a bird flu virus in its biomedical research laboratories in Orth on the Danube in December 2008.

Baxter uses BSL 3 (Biosafety Level 3) precautions in its laboratories, a system for the safehandling of toxic substances, which makes an accidental contamination of ordinary flu material with the dangerous bird flu virus virtually impossible.

The 72 kilograms of contaminated vaccine material contained a mixture of a seasonal H3N2 human influenza virus and the deadly bird flu H5N1 virus. By adding a virus of the type H5N1 to an ordinary flu virus of the type H3N2, The H5N1 virus is restricted in its human-to-human transmissibility, especially because it is less airborne. However, when it is combined with seasonal flu viruses, which are airborne and easily spread, a new bioweapon is created.

Second, Baxter distributed via Avir this contaminated vaccines using false concealment and a false label to 16 laboratories in Austria and in other countries at the end of January/beginning of February, potentially infecting at least 36-37 laboratory staff, who had had to be treated preventively for bird flu and ordinary flu in hospital.

A total of 18 laboratory staff belonging to Avir had to undergo preventative treatment for the bird flu and ordinary flu at the Otto Wagner Hospital in Vienna on February, 9th, 2009, because of their exposure as part of their work to the highly pathogenic bird flu virus.

This indicates that, in the opinion of medical experts, there was a risk that the staff of Avir had contracted bird flu, and, unknowingly, acted as carriers of a pandemic virus into the population of a densely built up Vienna city district and in wintertime.

The material was only discovered when staff working for BioTest (in Konarovice in the Czech Republic), tested the vaccination on ferrets, who then died.

BiotTst was supposed to test anti-flu vaccination that should serve Europeans during the next flu season, and the labels on the material sent to them from Baxter via Avir gave no indication of the lethal contents.

The 13 BioTest staff were treated with Tamiflu and were placed in quarantine for fear they had been contaminated with the bird flu virus, which is on the list of the possible biological weapons and one of the most dangerous biological agents on the Earth with more than 60% death rate.

Subsequently the same problem of Baxter contaminated vaccine material was found in the laboratories in Slovenia, Austria and Germany, who had received the material from Baxter.

First, the company Baxter evoked the 'trade secret" and refused to explain how exactly how a Level 3 biological warfare pathogen found its way into H3N2 material, regardless whether or not this experimental vaccine material was 'intended' for eventual use in humans or not.

Baxter representatives have said that the material sent to the Czech republic, Austria, Slovenia and Germany was in fact a pure H5N1 sent by accident - maybe to mask the previous assumption, that it was in fact an ordinary flu vaccine, which was contaminated. It is still not clear whether it was in fact the pure H5N1 or contaminated vaccine.

The Austrian Health Minister Alois Stöger confirmed on May 20th 2009 that the 72 kilograms of contaminated vaccine material has been destroyed, but no information has been released as to the genetic sequences of the contaminated material or what Clade was Baxter's H5N1 vaccine from, whether from Clade 1? Clade 2? Clade 3? Other?

Therefore, it is not possible to know whether H5N1 resembles the strains circulating in waterfowl.

Was the contaminated H5N1 strain genetically engineered? If so, by whom? Does the NS protein in Baxter's H5N1 material contain polymorphisms which suppress human interferon production? Was Baxter's H5N1 a full set of influenza genes? Or was it just the hemaglutanin and neuraminidase? Did Baxter's H5N1 contain a poly-basic cleavage site on the Hemaglutanin surface protein? Why were the samples of experimental vaccine material not irradiated?

Coinfection of H5N1 and H3N2 would not produce simple reassortment but a complex in vivo recombination of many competing strains in the infected host.

Furthermore the complex coinfection of H5N1 and H3N2 in a human would produce natural selection pressure for maximum virulence.

The book "Evolutionary Dynamics" suggest that viral coinfection selects for both maximum virulence and infectivity.

How close the world came to a pandemic is underlined by the reaction of Panasonic Japan.

On February 9th – on the very same day as 18 employees of Avir were given preventative treatment for the bird flu in the Otto Wagner Hospital in Vienna – AFP reported that Panasonic

Japan intended to bring back to Japan the families of many of its staff working around the world because of the threat of a bird flu pandemic.

“Panasonic to fly home workers’ families over bird flu fears Feb 9, 2009

TOKYO (AFP) — Panasonic Corp. has ordered Japanese employees in some foreign countries to send their families home to Japan in preparation for a possible bird flu pandemic, a spokesman said Tuesday.”

The firm decided to take the rare measure “well ahead of possible confusion at the outbreak of a global pandemic,” he said.

The Times of India reported on March 6th, 2009, that a pandemic was nearly triggered as a result of Baxter’s actions.

http://timesofindia.indiatimes.com/Health--Science/Science/Virus-mix-up-bylab-could-have-resulted-in-pandemic/articleshow/4230882.cms

“It's emerged that virulent H5N1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the H5N1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, ferrets inoculated with the sample had died. It turned out the sample contained live H5N1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen."

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences.“

It needs to be stressed that the bird flu virus was developed in US military laboratories from 1995 onwards by researchers who reconstructed the genetic code of the Spanish Flu pandemic virus of 1918-1919.

So, using the argument that they need to find an antidote to the lethal bird flu virus, researchers have actually resurrected this lethal bird flu virus and created the danger in the first place, and with funds provided by organisations such as WHO.

“Reviving the Spanish Flu virus is a recipe for a catastrophe. It could put any attack using anthrax or the plague in the shade, “said Jan van Aken, head of the German section of the Sunshine Project.

In the summer of 2008, US researchers found that this newly reconstructed lethal bird flu virus could be mixed with ordinary human flu virus in laboratory conditions and so, in theory, could acquire easy human-to-human transmissibility.

It was precisely this very virus, a mix of a lethal H5N1 bird flu virus and an ordinary human flu H3N2 virus that Baxter manufactured in its laboratory in Orth/Donau in December 2008, and then distributed via Avir to 16 laboratories in Austria and abroad employing fraudulent misrepresentation.

The Canadian Press explains the issue:

“While H5N1 doesn’t easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.“

According to media reports, Dr Rebecca Carley maintained in March 2009 that this was a deliberate attempt to start a pandemic.

“Basically, they’re trying to cause the pandemic. They have already stockpiled at least 250 million doses of the bird flu vaccine. The shelf life of that vaccine has a certain amount of time by which they’ll have to throw it in the garbage. So they have to start the pandemic so that they can give the vaccines, which will then cause the bird flu pandemic…In fact, this is an associated press article that says that our government is reluctant to give bird flu vaccine to some of the rogue nations for fear they will use the vaccine as biological warfare. So when you actually look at what’s out there, folks, it becomes crystal clear. This is genocide. This is population reduction. And it’s happening right now. “

“Well, let me also state that this is very intentional because the H5N1 bird flu virus is not actually able to be picked up by humans in a regular scenario. So by putting it with a regular human flu, they’re intentionally causing it to create a hybrid virus. And this is how they’re going to make the bird flu virus be contracted by the people because it’s very virulent. And basically, the scenario that it creates is very disturbing. You actually bleed out into your lungs and suffocate on your own blood."

Jane Burgermeister

Chello internet provider censors emails with name “Jane Bürgermeister” in slot line

BirdFlu666, 7 August 2010
https://waterpressure.wordpress.com/2010/08/12/breaking-news-latest-developments-with-jane-burgermeister-w-h-o-scandalous-conflicts-of-interest-with-big-pharma-exposed/

Last Sunday evening, a big email campaign kicked off in Switzerland about my impending detention, igniting a huge response in the German speaking world but by Tuesday, the internet internet provider Chello was censoring any emails with Jane Bürgermeister in the slot line and marking them as spam.

An IT expert looked into the matter and found a block had been placed on my name by Chello.

I was told that even emails with my name in the body of the text were returned to the sender. My name had to be eliminated altogether before emails were allowed through the filter.

In spite of the censorship, the word spread fast on the internet and many blogs in the German speaking world posted about my impending detention by Austrian authorities, determined to silence swine flu vaccine critics before the next vaccine campaign.

Austrian state prosecutors appear to have faked second set of criminal charges to frame Jane Burgermeister

BirdFlu666, 7 August 2010
https://waterpressure.wordpress.com/2010/08/12/breaking-news-latest-developments-with-jane-burgermeister-w-h-o-scandalous-conflicts-of-interest-with-big-pharma-exposed/

The Austrian government appears to have faked two sets of criminal charges in an attempt to bury my own criminal charges documenting how judges in Austria plan to strip me of all my civic rights on August 12th on the basis of falsehoods.

According to a letter from the corruption state prosecutor Katja Wallenschewski dated July 27th, criminal charges were filed by Heiner Lohmann and Christine Cote.

Heiner Lohmann who lives in Germany on August 3 sent a signed letter confirming he never filed any criminal charges in Austria. He said he just sent in a general protest letter about the persecution of myself and other Austrian dissidents by the authorities.

And today Christine Cote has emailed to say she never filed any criminal charges either as Wallenschewski claimed.

I have made a written request to see the charges allegedly filed by Cote and Lohmann. Who knows what on earth is in these fictious documents?

The Austrian government has now been caught red-handed faking two sets of criminal charges to frame me as a dangerous conspiracy theorist.

Austrian government officials do not appear to be on the cutting edge of the internet age or to realise just how transparent this kind of fraud is nowadays."

Role of Austrian Chancellor in attempt to frame swine flu jab critic Jane Burgermeister comes into focus: new email reveals Bilderberg Chancellor was informed

BirdFlu666, 9 August 2010

The Austrian government has been caught red-handed faking two sets of criminal charges by Heiner Lohmann and Christine Cote in a bid to frame me . These fake charges in conjunction with a staged threat to a judge can be used to have me detained and even imprisoned.

Other bloggers in Austria and Germany critical of the government are facing the same treatment.

Natascha Koch, for example, was recently detained in Graz, Austria, on the basis of a staged threat to a clinic. The strength of public protests resulted in her being freed again in three days.

Christine Cote was among the people protesting the detention of Natascha Koch on spurious grounds.

She wrote an email to Judge Michaela Lauer – the judge who applied for my court guardianship on the basis of false claims and file manipulation — asking the authorities to stop persecuting me and other critics on July 4th.

Chrstine Cote cc'd in the Interior Minister Maria Fekter, the Justice Minister Claudia Bandion-Ortner, the Ombudsmen, including Gertrude Brinek as well as the State Prosecutor's office and the head of the national bank Ewald Nowotny. She also sent a letter to the Austrian Chancellor Werner Faymann as well as the President Heinz Fischer, she says.

That means that all these people must have been informed about my situation on July 5th at the latest.

Did the Chancellor Werner Faymann know that Christine Cote and Heiner Lohmann's letter asking the government to stop persecuting me had been turned into fake criminal charges? Did he know that these fake charges were dropped almost immediately after I filed charges on July 23 documenting file manipulation, false accusations and fraud to justify my being stripped of all my rights under a court guardianship?

That they were fake charges is clear: the charges were dropped just two working days after my criminal charges with new evidence were filed on July23 . Why wasn't my additional material documenting persecution by Judge Michaela Lauer investigated by the state prosecutor if Cote's and Lohmann's letters were really being treated as criminal charges?

Did Corruption State Prosecutor Katja Wallenschewski only dare create fake criminal charges to bury my own and frame me because she was certain she had cover from the very top of the government, and even the chancellor and justice minister?

Or did Wallenschewski simply not realise that even Austria is now in the internet age and information spreads quickly?

Within a couple of days of the letter from Wallenschewski appearing on the internet stating that criminal charges by Heiner Lohmann and Christine Cote had been filed, both people contacted me to say they had never filed any criminal charges.

Heiner Lohmann and Christine Cote were trying to protest my persecution by the government – but found their protests misused by the same government to persecute me still more.

Christine Cote underlines my role in warning people that the swine flu pandemic was hyped and the swine vaccination risky.

I filed charges against Baxter in April 2009 after Baxter contaminated 72 kilos of seasonal flu material with the bird flu virus, supplied by WHO. The material was sent to 16 labs in 4 coutries and could have sparked a global bird flu pandemic, according to the Times of India.

Just two weeks or so after I filed criminal charges against Baxter the „swine flu“ pandemic appeared in Mexico and was clearly a hyped and staged pandemic.

Although the Vienna state prosecutor opened an investigation into Baxter's contamination of seasonal flu material at ist biosecurity labs in Orth an der Donau, the investigation was dropped in September 2009 in spite of the fact that experts rule out an accidental contamination given the existence of biosecurity level 3 precautions.

In June 2009, Chancellor Werner Faymann attended the annual Bilderberg meeting near Athens along with David Rockefeller, a big funder of WHO and vaccine sterilisation programmes, and Daniel Vasella, CEO of Novartis, a company that made billions through the swine flu scam.

It has now been established beyond doubt that the top officials in the Austrian government, including the Chancellor Faymann, the Interior Minister and the Justice Minister all knew about Christine Cote's letter requesting that the government cease its persecution of me and other critics such as Natascha Koch on July 5th.

It cannot be ruled out that they actively encouraged this persecution because they want to eliminate a critic of their swine flu policies.

After all, what state prosecutor would dare carry out such a sleight of hand and turn a letter asking for the authorities to stop hounding me into fake criminal charges only to drop those charges immediately after I supplied mor

Pandemia No Hay Ninguna: ¡Detengan La Vacuna!

La pandemia es un alarde y la vacuna es un fraude

Jane Burgermeister

Interrogación kafkiana en corte de Viena: ¿Están los cargos a Baxter detrás de todo esto?

Detengan La Vacuna! – 12 agosto 2010
https://detenganlavacuna.wordpress.com/2010/08/12/jane-burgermeister-comparece/

Se supone que los jueces toman sus decisiones basados en la evidencia, documentos y hechos, pero en la corte de Döbling en Viena, esto claramente no es requisito.

Un e-mail de una persona desconocida parece ser usado de base para la decisión de colocarme un guardián legal y quitarme todos mis derechos civiles a toda velocidad, cuando fui a las 10 AM a la corte de Döbling, Viena, para mi interrogación por parte del juez Dr. Hannes Winge.

Se me dijo que la entrevista probablemente sólo duraría unos 5 minutos y que no me molestara en traer ningún documento, ya que los tenían todos.

Para mi sorpresa la primera pregunta que me hizo el Dr. Winge en su espaciosa oficina fue sobre un e-mail de una persona de la que nunca he oído hablar, llamada Christina Braun quien aparentemente escribió sobre mi rol en la pandemia de gripe porcina.

Claramente él quería enfocarse en este e-mail de esta tal Christina Braun, y se veía determinado a colocarme un guardián legal sin demoras, incluso pidiéndome nombrar a un representante. Me negué, ya que nada de este procedimiento se justifica por la ley.

Parecía no tener conocimiento alguno, ni interés siquiera, en las copias de las apelaciones que entregué hace un mes, junto con los documentos que demuestran que los motivos de la Jueza Michaela Lauer para atribuirme una custodia legal en conexión con la herencia de mi padre son todos falsos, incluso cuando ESTE debería haber sido el enfoque de la entrevista.

Había una copia en su escritorio. Pero el prístino estado de las páginas reveló que habían salido directo de la fotocopiadora y nadie las había tocado desde entonces, y eso -aunque el Dr. Winge debe tomar una decisión tan pesada sobre mi futuro- que implica que debería haber estudiado la evidencia.

Tuve que insistir para que el Dr. Winge mirara las pruebas, los documentos, las cuentas, e-mails y otra evidencia de que la Jueza Lauer empuja para colocarme un guardián legal sobre la base de acusaciones falsas y con el fin de enterrar la evidencia de su propia corrupción.

Al final, tuve que pasar 2 horas en la oficina mostrando toda la evidencia al Dr. Winge, evidencia tan fuerte que no la pudo ignorar. En un punto, hasta el más caprichoso sistema de justicia tiene que tomar en cuenta la realidad.

El Dr. Winge amablemente aceptó al final mirar en los archivos y estudiar la evidencia. ¡Tonta yo! Había tenido la impresión de que el examen de la evidencia también sucedía antes de la entrevista no sólo después.

Dijo que necesitaría alrededor de un mes y luego tomaría su decisión sobre si desestimar el caso o no.

Le hice notar que debía dar razones para su decisión, y que las razones debían tener una base en los hechos, y que poner guardianes legales etc, sólo para silenciarme es de hecho una ofensa criminal.

En lugar de una entrevista justa, el Dr. Winge parecía desear hablar sólo de un irrelevante e-mail de alguien que no conozco en absoluto, y seguir adelante a colocarme mi custodia legal inmediatamente.

Esto me recuerda los falsos cargos criminales que creó la fiscal de corrupción Katja Wallenschewksi sobre cartas de protesta acerca de mi persecución, enviada por Heiner Lohmann y Christine Cote.

Parece que cualquier e-mail "bandera falsa" o cargos criminales falsos servirán de felíz excusa para ni siquiera mirar los hechos en mano y de seguir tratando de tenderme trampas.

Tengo que preguntarme: ¿por qué está tan desesperado el gobierno austríaco para callarme? ¿Por qué arriesgar semejante escándalo para quitarme mis derechos? Cualquiera que lea la apelación y cargos criminales en internet puede ver que las acusaciones hechas en mi contra son triviales o falsas.

Que se le quiten a uno los derechos civiles porque supuestamente uno no hizo cosas como pagar el seguro de la casa de su padre – cuando se tiene el recibo que demuestra que sí lo hice – y eso que era obligación de la jueza Lauer y el abogado Hutz el hacerlo, para empezar- es como una comedia muy, muy negra. Saber que uno puede ser detenido para siempre por que la jueza Lauer falsamente afirma que "yo hice muchas nuevas exigencias para la evaluación de varias propiedades" es como una novela de Stephen King.

Lo que la jueza dice de mí equivale a difamación.

Una razón de que el gobierno austríaco esté tan desesperado de quitarme de en medio, es que el reporte del Consejo de Europa por el Médico Británico Paul Flynn sobre la exageración de la pandemia de gripe porcina, debe debatirse en el parlamento austriaco junto con otros parlamentos en Europa en su próxima sesión. También, 220 Parlamentarios Europeos exigieron una investigación de la gripe porcina al Parlamento Europeo, aunque esto se ha bloqueado por ahora.

Tal vez el gobierno austriaco teme que el inminente debate recalcará otra vez el incidente en que los 72 kilos de vacuna estacional fueron contaminados por Baxter en febrero 2009 en Orth an der Donau. Ya que el mortal virus de la gripe aviar debe mantenerse en laboratorios de bioseguridad de nivel 3, una contaminación accidental puede virtualmente descartarse. El material se envió a 16 laboratorios en 4 países. Sólo un técnico de laboratorio alerta en la República Checa detectó el virus, después de decidir probarlo en hurones.

Presenté cargos contra Baxter el 8 de abril 2009 después que no hubiera verdadera investigación relevante de las autoridades (mandaron un veterinario a inspeccionar el laboratorio). El fiscal de estado inició una investigación, la que se abandonó en septiembre del 2009.

Baxter podría haber iniciado una pandemia global de gripe aviar, disparando vacunaciones masivas en febrero del 2009. Estas vacunaciones pandémicas pueden incluso ser hechas obligatorias bajo la declaración de pandemia de nivel 6 por parte de OMS.

Unos días después de presentar mis cargos, la gripe porcina apareció misteriosamente en México.

El que la gripe porcina fuera exagerada por la OMS y las farmacéuticas por provecho, ha sido entretanto comprobado por la evidencia presentada por los reportes del Consejo de Europa y estudios como el que apareció en el BMJ.

Bien puede ser que Baxter y el crimen organizado internacional al que yo acusé de empezar deliberadamente una pandemia para provecho en abril 2009, se sienten menos confiados en su capacidad de soportar el escrutinio.

Sólo alrededor del 3% al 4% de los austriacos se pusieron la vacuna H1N1, a pesar de la enorme propaganda y las exhortaciones del Ministro de Salud Alois Stöger. Un 40% usa la vacuna estacional cada año como rutina; las autoridades claramente anticipaban que un 60% a 70% tomaran la vacuna de gripe porcina.

Pero los austriacos no creyeron la mentira. Y el gobierno debe estar preocupado de su capacidad para meter mentiras sobre toda la pandemia, y el incidente de gripe aviar de Baxter.

Al prepararse las farmacéuticas y gobiernos para campañas de vacunas sin precedentes, todo escrutinio sobre la contaminación de Baxter en febrero de 2009 puede ser visto como una amenaza cada vez más grande.

De hecho, de ser Baxter encontrado culpable en una corte de intentar deliberadamente iniciar una pandemia global de gripe aviar, podría ser un golpe mortal para toda la industria farmacéutica y complejo de vacunas del mundo.

Deshacerse de mí a través de la custodia legal por acusaciones falsas y triviales, y también poniéndome trampas con cargos falsos, puede parecer una mejor opción dadas las posibles repercusiones de una investigación sustancial a la casa Baxter.

La simple cantidad de publicidad que mi caso está recibiendo, imposibilitará sin embargo que me quiten del medio. La base legal es inexistente y sólo hay cierto límite de capricho y excentricidad que un sistema de justicia se puede permitir, en la era de la internet, antes de que se desacredite totalmente a ojos del público general.

Tan pronto como la custodia legal se descarte, puedo y pediré compensación porque la custodia legal injustificada de hecho se reduce a un intento de detención ilegal y de silenciar a una alertadora.

Mientras más dure esto hasta que finalmente se desestime, mayor será la posibilidad de petición de compensación y mayor publicidad generará este caso.

El caso Baxter de nuevo está bajo el foco junto con la corrupción del sistema de justicia austriaco que no fue capaz de investigar la contaminación de 72 kilos de vacuna estacional con virus de gripe aviar, que podía en potencia amenazar a la gente alrededor del mundo entero.

En una nota personal, las últimas semanas me han hecho comprender lo que la palabra “Kafkiana” y “surrealista” realmente significan. Ser perseguido por un estado malévolo no es ninguna broma.

Por más pesadilla que haya sido este tiempo, he quedado abrumada por la cantidad de apoyo que he tenido por parte de gente por todo el mundo.

No tengo tiempo de contestar todos los e-mails, desgraciadamente, ya que la gente como el Dr. Winge me obliga a llenar aún más documentos, etc, aunque trato de contestar los e-mails que puedo.

Pero el apoyo de tanta gente, también desde Suiza y de “We Are Change” de Austria, ha sido realmente sorprendente, y me siento impresionada y agradecida de haber experimentado tal generosidad, bondad y buena voluntad de tanta gente alrededor del mundo.

Kafkaesque interrogation at Vienna court: Are the Baxter charges behind this?

BirdFlu666, 12 August 2010, 2:12 pm
https://web.archive.org/web/20100814202618/http://birdflu666.wordpress.com/2010/08/12/kafkaesque-interrogation-at-vienna-court-are-the-baxter-charges-behind-this/

Judges are supposed to make their decisions on the basis of evidence, documents and facts, But in the court Döbling in Vienna, this is clearly not a requirement.

An email from an unknown person appeared to be set to be the basis of the decision to appoint a legal guardian and strip me of all my civic rights at top speed when I went at 10 am this morning to the court in Döbling, Vienna, for my interrogation by judge Dr Hannes Winge.

I was told the interview would probably last only 15 minutes and not to bother bringing any documents along as they were all.

To my surprise, Dr Winge's first question to me in his spacious office was about an email from a person I have never heard of called „Christina Braun", writing apparently about my role in the swine flu pandemic.

He clearly wanted to focus on this email from this Christina Braun and seemed intent on appointing a legal guardian for me without delay, even asking me to name a representative. I refused because the whole procedure is not justified by the law.

He seemed to have absolutely knowledge at all or even the slightest interest in the copies of the appeals I had handed in one month ago with documents proving that Judge Michaela Lauer's reasons for appointing a legal guardian in connection with my Dad's inheritance are all false even though this should have been the focus of our interview.

A copy lay on his desk. But the pristine pages betrayed that they had come straight out of the photocopy machine and had lain untouched ever since - and that even though Dr Winge is making such a weighty decision about my future and is supposed to be studying the evidence.

I had to insist that Dr Winge look at the proof, documents, bills, emails and evidence that Judge Lauer is pushing to appoint a legal guardian for me on the basis of false accusations and in order to bury evidence of her corruption.

In the end, I had to spend two hours in the office as I laid out all the evidence to Dr Winge – evidence so strong he could not ignore it. At some point, even the most capricious justice system has to take account of reality.

Dr Winge graciously agreed at the end to look at the files and study the evidence. Foolish me! I had been under the impression the examination of evidence also happened before the interview – and not only after.

He said he would need about a month and would then make his decision about whether to drop the case or not.

I pointed out to him that he would have to give reasons for his decision and that the reasons had to have some basis in facts and that appointing legal guardians etc for me just to silence me is actually a criminal offence.

Instead of a fair hearing , Dr Winge appeared to wish to discuss only an irrelevant email from a person I have never heard of and to move forward to appoint a legal guardian immediately.

That remainds of the fake criminal charges created by the corruption state prosecutor Katja Wallenschewksi out of letters of protest about my persecution by Heiner Lohmann and Christine Cote.

It seems any, „false flag" email or criminal charges will serve as a happy excuse not to look at the facts at hand and to continue with framing me.

I have to ask myself: why is the Austrian government so desperate to silence me? Why do they risk such a scandal to strip me of my rights? Anyone who reads the appeals and criminal charges on the internet can see that the accusations made against me are trivial or lies.

Being stripped of your civil rights because you allegedly have not done things like pay the insurance of your Dad's house when you have the bill proving you paid – and when it was the job of the Judge Lauer and solicitor Hutz anyway to do this is the first place – is like a black, black comedy. Knowing you could be detained forever because Judge Lauer falsely claims I "made ever new demans for the evaluation of various properties" is like a twist in a Stephen King novel.

What the judge says about me amounts to defamation.

One reason the Austrian government could be so deseperate to remove me is because the Council of Europe report by UK MP Paul Flynn on the swine flu pandemic hype is set to be debated in the Austrian parliament, along with all other parliaments in Europe, in the next session. Also, 220 MEPs demanded an investigation into the swine flu at the European Parliament, though this has been blocked for now.

Maybe the Austrian govenrment fears that the upcoming debate will highlight once more the incident where 72 kilos of seasonal flu was contaminated by Baxter in February 2009 in Orth an der Donau. Because the deadly bird flu virus has to be kept in a biosecurity level 3 lab, an accidental contamination can be virtually ruled out. The material was sent to 16 labs in four countries. Only an alert lab technician in the Czech Republic detected the virus after testing it on ferrets.

I filed charges against Baxter on April 8th after there was no meaningful investigation by the authorities. A vet was sent to inspect the lab. The state prosecutor did start an investigation which was dropped in September 2009.

Baxter could have sparked a global bird flu pandemic, triggering mass vaccinations, in Februrary 2009. These pandemic vaccinations can even be made compulsory under the pandemic level 6 declaration by WHO.

A few days after I filed charges, the swine flu mysteriously appeared in Mexico.

That the swine flu virus was hyped by WHO and by the pharamceutical companies for profit has been confirmed, in the meantime, by evidence presented reports by the Council of Europe and studies such as have appeared in the BMJ.

It could well be that Baxter and the international corporate crime syndicate that I accused of deliberately starting a pandemic for profit in April 2009 is feeling less confident about ist ability to withstand scrutiny.

Only about 3% to 4% of the Austrians took the swine flu vaccine in spite of the gigantic media hype and the exhortations of the health minister Alois Stöger. About 40% take the seasonal flu shot every year as a matter of routine. The authorities clearly anticipated that 60% to 70% would take the swine flu shot.

But the Austrians did not believe the hype. And the government must be worried about its ability to give its spin to the whole swine flu pandemic and Baxter bird flu incident.

As pharamceutical companies and government gear up for unprecedented vaccine campaigns, any scrutiny of the Baxter's contamination in February 2009 may be seen as a increasingly big threat.

Indeed, if Baxter were ever convicted in a court of law of deliberately attempting to start a global bird flu pandemic, it could well deal a death blow to the whole pharmaceutical industry and vaccine complex around the world.

Getting rid of me though a legal guardianship under false and trivial accusations and also by framing me by fake criminal charges may seem a better option given the possible repercussions of a substantial investigation into Baxter.

The sheer amount of publicity my case is getting will, however, make it impossible for them to remove me. The legal basis is non existant and there is only so much caprice and eccentricity a justice system can allow itself in the age of the internet before it discredits itself totally in the eyes of the general public.

As soon as the court guardianship is dropped, I can and will file for compensation because this unjustified legal guardianship actually boils down to an attempt at an illegal detention and the silencing of a whistleblower.

The longer this drags on before it is finally laid to rest as it must finally be, the higher my compensation claims can be and the more publicity this case will generate.

The Baxter case is once more already in the spotlight along with the corruption of the Austrian justice system that failed to investigate the contamination of 72 kilos of seasonal flu vaccine material with the bird f u virus that could potentially have endangered people all around the globe.

On a personal note, the last few weeks have made me understand what the word "Kafkaseque" and "surreal" really means. Being hounded by a malevolent state is no joke at all.

Nightmarish as this time has been, I have been overwhelmed by the amount of support I have had from people all over the world.

I don't have time to answer all the emails, alas , as the likes of Dr Winge force me to go on filing documents etc, though I try to answer as many emails as I can.

But the support of so many people, also from Switzerland and from We Are Change Austria, has been truly amazing, and I feel humbled and grateful to have experienced so much generosity, kindess and good will from so many people around the world.

The Watchdog
Keeping citizens in the loop

Frank Cogan

'Open Letter' to the Irish Ambassador to Austria

The WatchDog / WaterPressure, 13 August 2010
https://waterpressure.wordpress.com/2010/08/12/breaking-news-latest-developments-with-jane-burgermeister-w-h-o-scandalous-conflicts-of-interest-with-big-pharma-exposed/

Dear Ambassador Frank Cogan,

Internationally, I think it is fair to say:
"AUSTRIA – THE WORLD IS WATCHING!"

The persecution of Irish/Austrian investigative journalist Jane Burgermeister by the Austrian Government must cease forthwith today in Court.

Jane Burgermeister's courage in helping to expose the $wine flu scam, helped to inspire a global fightback.

Jane has summarised her current predicament as follows:

"Now that there is verifiable, unambiguous evidence that the Austrian government and state prosecutors have faked criminal charges to provide a pretext to arrest and detain me, I am going to apply to the European Court of Human Rights.

Under Article 6 of the Human Rights Convention, all Europeans have the right to a fair trial and proper judicial process, and this is being denied to me. The Austrian state prosecutor for corruption Katja Wallenschewski sent a ltter saying that criminal charges by a Heiner Lohmann and Christine Cote had been filed. But Heiner Lohmann has since signed a letter to state that he had never filed criminal charges in Austria. He had just a general protest letter forwarding a letter from Christine Cote praising my contribution in opening people's eyes to the swine flu scam.

By faking the criminal charges, the prosecutors hoped to bury my own charges dealing evidence of file manipulation and false accusations. They also hoped to brand me as a dangerous conspiracy theorist.

On August 12th, I have to go to the court to be interviewed about being placed under a court guardianship on the basis of these fake charges too. This will see me stripped of all my civic rights and any assets I am due to inherit. The government and Big Pharma seem determined to silence vaccine critics by any means."

We look forward to confirmation that you as the Irish Ambassador, Frank, are taking all possible steps to ensure Jane's human rights are protected, including attending Court proceedings, and raising your concerns directly with the highest levels with the Austrian Government.

In order to assist, please be advised of the following steps that have been taken by concerned citizens all over the world, in order to help protect Jane Burgermeister.

A) The 'Open Letter' I sent to the UN Ambassador for Austria on 11 August 2010, after I had contacted UN Ambassadors in countries all over the world.

B) The petition signed internationally, at very short notice by over 1000 people.

C) Breaking news over the last 24 hours, confirming scandalous 'conflicts of interest' between WHO and major pharmaceutical companies who have financially profited from the bogus $wine flu 'pandemic' – which proves Jane Burgermeister (and others) who 'blew the whistle', acted in the global public interest and must be protected for so doing.

The Dark History of Vaccines, Natural Healing Clinic

13 March 2015

https://teachingyourselftoheal.wordpress.com/2015/03/13/the-dark-history-of-vaccines/

Stats Regarding Vaccines

A good place to start research is on the internet. Go to National Vaccine Center's website and start learning about various vaccines. Judicial Watch is another website. These are watchdogs to help keep us informed about truths being kept from us. There are many others.

...

Avian Flu Vaccine

Toronto Sun reported not long ago (2009) that Baxter International r*eleased seasonal flu virus material from a plant in Austria containing live H5N1 Avian Flu Virus*. It was sent to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died.

Ferrets shouldn't die from exposure to human H3N2 flu viruses.

Accidental release of a mixture of live avian H5N1 and human H3N2 viruses could have resulted in dire consequences. H5N1 doesn't easily infect people, H3N2 viruses does. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people. That mixing process, called reassortment, is one of two ways pandemic viruses are created.

Mike Adams, the Health Ranger, Natural News Editor writes in Vaccines as Biological Weapons?

Live Avian Flu Virus Placed in Baxter Vaccine Materials Sent to 18 Countries:

Deerfield, Illinois-based pharmaceutical company Baxter International Inc. has just been caught shipping live avian flu viruses mixed with vaccine material to medical distributors in 18 countries.

The 'mistake' was discovered by the National Microbiology Laboratory in Canada. The World Health Organization was alerted and panic spread throughout the vaccine community as health experts asked the obvious question: How could this have happened?

Or put another way, Baxter is acting a whole lot like a biological terrorism organization these days, sending deadly viral samples around the world. If you mail an envelope full of anthrax to your Senator, you get arrested as a terrorist. So why is Baxter – which mailed samples of a far more deadly viral strain to labs around the world – getting away with saying, essentially, "Oops?"

But there's a bigger question in all this: How could this company have accidentally mixed LIVE avian flu viruses (both H5N1 and H3N2, the human form) in this vaccine material?

Was the viral contamination intentional?

The shocking answer is that this couldn't have been an accident because Baxter International adheres to something called BSLE (Biosafety Level 3) – a set of laboratory safety protocols that prevent the cross-contamination fo materials.

Laboratory personnel have specific training in handling pathogenic and potentially lethal agents and are supervised by competent scientists who are experienced in working with these agents.

This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features.

It is bad enough that governments all over the world have been warning about the likely pandemic flu. Now we find out we cannot trust Big Pharma to handle such bio-hazardous material in a safe manner.

Who knows whether it was intentional? But I sure would like to know what really happened? And I sure would like to see the people responsible fired!

Paul J. Watson adds in "Accidental' Contamination of Vaccine with Live Avian Flu Virus Virtually Impossible: Czech newspapers are questioning if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

The claim holds weight because, according to the very laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

"The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses," reports the Canadian Press.

Baxter flu vaccines contaminated with H5N1 – otherwise known as the human form of avian flu, one of the most deadly biological weapons on earth with a 60% kill rate – were received by labs in the Czech Republic, Germany, and Slovenia.

Initially, Baxter attempted to stonewall questions by invoking "trade secrets" and refused to reveal how the vaccines were contaminated with H5N1. After increased pressure they then claimed that pure H5N1 batches were sent by accident. This was seemingly an attempt to quickly change the story and hide the fact that the accidental contamination of a vaccine with a deadly biological agent like avian flu is virtually impossible and the only way it could have happened was by wilful gross criminal negligence.

According to a compiled translation from Czech newspaper stories, the media over there is asking tough questions about whether the contamination was part of a deliberate attempt to start a pandemic.

"Was this just a criminal negligence or it was an attempt to provoke pandemia using vaccination against flu to spread the disease – as happened with the anti-B hepatitis vaccination with vaccines containing the HIV virus in US? – and then cash for the vaccines against H5N1 which Baxter develops? How could on Earth a virus as H5N1 come to the ordinary flu vaccines? Don't they follow even basic precautions in the American pharma companies?" states the translation.

The fact that Baxter mixed the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is the smoking gun. The H5N1 virus on its own has killed hundreds of people, but it is less airborne and more restricted in the ease with which it can spread. However, when combined with seasonal flu viruses, which as everyone knows are super-airborne and easily spread, the effect is a potent, super-airbone, super deadly biological weapon.

Spreading bird flu would create an instantaneous surge of demand for bird flu vaccines. The profits that vaccine companies such as Baxter International could reap out of such a panic are astronomical.

In addition, as we have previously reported, those that have a stake in the Tamiflu vaccine include top globalists and BIlderberg members like George Shultz, Lodewijk J.R. de Vink and former Secretary of Defense Donald Rumsfeld.

Authorities in both Europe and the U.S. have openly detailed plans for martial law, quarantine and internment should a bird flu pandemic occur.

The other motivation, as we have exhaustively documented on this website for years, is the fact that elites throughout history have openly stated that they want to see a world population reduction of around 80 per cent. Shocking stories like this take the plausibility of that narrative out of the realms of conspiracy theory and into the dangerous reality of conspiracy fact.

This is not the first time that vaccine companies have been caught distributing vaccines contaminated with deadly viruses. In 2006 it was revealed that Bayer Corporation had discovered that their injection drug, which was used by hemophiliacs, was contaminated with the HIV virus.

Internal documents prove that after they positively knew that the drug was contaminated, they took it off the U.S. market only to dump it on the European, Asian and latin American markets, knowingly exposing thousands, most of them children, to the live HIV virus. Government officials in France went to prison for allowing the drug to be distributed. The documents show that the FDA colluded with Bayer to cover-up the scandal and allowed the deadly drug to be distributed globally. No Bayer executives ever faced arrest or prosecution in the United States.

Laplandetza [Информация относно КОВИД-19]

Форум "Наука", Април 13, 2020
https://www.forumnauka.bg/topic/22900-informaciya-otnosno-kovid-19/page/32/

Още през юли 1969 г. директорът на Управлението за перспективни изследователски програми към армията на САЩ доктор Макартър се изказва пред Конгреса в Комитета по асигнация на Белия дом. Той заявил, че „в течение на 5-10 години ще е възможно да се произведе синтетичен биологичен вирус, който не съществува в природата и срещу който не може да има естествен имунитет".

В края на 80-те години Конгресът публикува материали от тези изслушвания с шокиращите откровения на доктор Макартър за разработването на синтетични биологични вируси в лабораториите. Стана известно, че две групи изследователи – европейска, под ръководството на Рон Фуше, от Ротердам, и американска, начело с професор Йошихиро Каваока, от университета „Уисконсин-Медисън", - са създали в лаборатория щамовете на вируса H5N1 (т. нар. птичи грип), който се предава от човек на човек по въздушно-капков път (експериментите се провеждали върху домашно порче, феретка). Учените изпратили своите статии в найизвестните научни списания – проф. Каваока – в сп. „Нейчър" ("Nature"), Рон Фуше – в сп. „Наука" („Science"). В края на декември 2011 г. обаче Националният научен съвет по биобезопасност на САЩ (National Science Advisory Board for Biosecurity, NSABB) разпраща на главните редактори на двете списания и на авторите на статиите писма, в които настоятелно препоръчва тези текстове да не се публикуват.

Шефът на NSABB Пол Кейм обяснил на пресата защо публикациите за резултатите от изследванията са били забранени: „Потенциалът на вируса H5N1 е толкова мощен, че аз не си представям на какво друго още е способен той" – тези думи на Кейм са цитирани от британската агенция „Ройтерс". Кейм отбелязва, че на този етап създаденият вирус е най-голямата заплаха за живота на всички хора, и че смъртността е много повисока в сравнение с „испанката" (т.е. испанският грип, б.пр.) от 1918-1919 г." (тогава загиват 40 милиона души).

Националният научен съвет по сигурността мотивира своето решение (да не се публикуват изследванията, б. пр.) с факта, че двата щама са изкуствено създадени в лаборатория и може да попаднат в ръцете на биотерористи. Както знаем, подготовката за евентуална биологична война предполага не само наличие на смъртоносен вирус, но и ваксини за него. Само че шефът на NSABB Кейм не съобщава нищо за такава, вероятно защото тя не е за „простосмъртни".

През февруари 2009 г. щаб-квартирата на транснационалната фармацевтична корпорация "Baxter", базирана в Австрия, изпраща на 16 европейски лаборатории в четири държави 62 кг субстанция за производство на ваксина от „сезонен грип". Техник в една от лабораториите, разположена в Чехия, открива, че субстанцията е заразена с два живи вируса на грипа. Единият е обикновеният сезонен вирус, който има следните характеристики – ниска смъртност (помалко от 1 %), но много висока степен на разпространение (заразяване). Другият вирус на грип имал много ниска степен на разпространение, но пък бил с висока смъртност (около 60 %). Очевидно, че при смесването на тези два вируса има огромна вероятност да се създаде нов вирус с две ключови характеристики – висока степен на разпространение (заразяване) и смъртност. Ако този сътрудник не бе открил случайно факта на заразената субстанция (или ако беше скрил тази информация), щеше да се появи реална заплаха от най-ужасната пандемия, защото 62 кг субстанция стига едва за няколко хиляди дози ваксина.

Австрийската журналистка Джейн Бургермайстер, която публикува свое разследване по тази афера, отправи публично искане до Световната здравна организация, до ООН и до правителствата на редица държави, обвини корпорацията "Baxter" в „биотероризъм и опит за масово убийство". Заразяването на субстанцията бе официално потвърдено и от компанията.

Само че делото и досега чака за разглеждане в СЗО.

Chapter 4

Change of a Definition of a Pandemic on the WHO website

CNN Health

Elizabeth Cohen

When a pandemic isn't a pandemic

CNN, Health, 4 May 2009; Updated 22:42 GMT (06:42 HKT)
https://edition.cnn.com/2009/HEALTH/05/04/swine.flu.pandemic/index.html

Atlanta, Georgia (CNN) – When the World Health Organization raised its influenza pandemic alert from a Phase 4 to a Phase 5 last week, there was a bit of a gasp heard round the world.

News about the pandemic sent people to line up at a mobile health clinic in Mexico City.

After all, Phase 5 "is a strong signal that a pandemic is imminent," according to WHO.

"All countries should immediately activate their pandemic preparedness plans," the organization's director-general, Dr. Margaret Chan, said Wednesday. "After all, it really is all of humanity that is under threat during a pandemic."

But the word "pandemic" isn't quite as scary as it sounds, explained **David Ozonoff**, professor of environmental health at the Boston University School of Public Health.

"When people hear the words 'pandemic' and 'flu,' the first thing that comes to mind is 1918, which was a real horror show," Ozonoff said, referring to the flu pandemic that killed some 50 million people 91 years ago. But you can have a pandemic without a large number of deaths, he said. "The word pandemic refers to how widely dispersed a disease is, not to how severe the disease is," he said.

Confusion about the meaning of "pandemic" is understandable, Ozonoff said, considering the definition of the word is "not set in stone."

Until Monday morning, the WHO *had a definition* on its Web site saying that a pandemic flu causes "enormous numbers of deaths and illness." After a CNN reporter pointed this out, WHO spokeswoman *Natalie Boudou*[1] called back to say the *definition was in error* and had been pulled from the WHO Web site.

"***It was a mistake***, and we apologize for the confusion," she said. "(That definition) was put up a while ago and paints a rather bleak picture and could be very scary."

The correct definition is that "pandemic" indicates outbreaks in at least two of the regions into which WHO divides the world, but has nothing to do with the severity of the illnesses or the number of deaths.

Based on lessons from the past, "influenza may cause mild disease in affluent countries, but more severe disease, with higher mortality, in developing countries," Chan said at Wednesday's news conference.

There have been three influenza pandemics in this century, said Andrew Pekosz, associate professor of microbiology and immunology at Johns Hopkins University's Bloomberg School of Public Health. The other two, in 1957 and 1968, also were caused by new viruses to which no one had immunity, but didn't cause nearly the number of deaths as the one in 1918.

"I think people need to be reminded that this current H1N1 outbreak is going to resemble much more the pandemics in 1957 and 1968, where there was an increase in deaths from other years, but nothing like the millions of deaths we saw in 1918," Pekosz said.

A Dictionary of Medicine:
Including General Pathology, General Therapeutics, Hygiene,
and the Diseases of Women and Children

New York: D. Appleton, 1895

EPIDEMIC (*epidemicus*, affecting the people; from *ἐπί*, upon; and *δήμος*, a people).
The word 'epidemic' is used in two senses by medical writers and by medical men, namely, (1) in a general sense, and (2) in a technical sense.

As a *general term* the word signifies 'common to, or affecting, a whole people, or a great number in a community; prevalent; general' (*Webster's Dictionary*). It is in this sense that the word is used when it is applied to mental, moral, and social phenomena, as, for example, when we speak or write of 'epidemic suicide,' 'epidemic folly.' This employment of the word is consistent with received literary practice. Thus we read, 'There was a time when wit was epidemic ' (*Athenæum*). Again, M. Littré, writing to the *Temps*: 'It argues great confidence in oneself and one's own enlightenment to treat with haughty disdain, and without reserving any compromise, the opinion of so many citizens, and to regard it as a. case of *epidemic aberration*.'

As a *technical term*, having reference to disease, the word 'epidemic' has several different meanings attached to it. All these meanings include the notion of general prevalence among a community or a people, but some of them would go on, beyond what etymology justifies, to attach a peculiar hypothetical or theoretical conception to the term. Thus (a) Mayne restricts the term to diseases which are contagious, making contagion the essence of epidemicity, as he would phrase it; (b) Dunglison implies by the term a particular constitution of the air ('*constitutio aeris*, or condition of the atmosphere '); (c) other authoritative writers use the term as signifying a widespread cause, telluric, atmospheric, cosmic, as the case may be, acting at the same moment of time on many individuals, or as something occult, regarding which speculation is vain, and which they designate *epidemic constitution or epidemic influence*. ... [Vol. 1, 589]

PANDEMIC DISEASES (*πᾶν*, all; and *δήμος*, the people). – Epidemic diseases which affect groups of several countries or the world generally. See *Epidemic*. [Vol. 2, 297]

Epidemic [Gk *epidēm(os)* (from *epi* on or among + *dēmos* the people) on or among the people]

1. An unusual increase, not necessarily within a short time, in the number of cases of a transmissible disease previously existing only at an endemic level in a region or population, or the appearance of an unusual number of cases of a disease which was not recognized as being endemic in a region or population.

In modern usage, this term has been extended to apply to any considerable increase in illness whether or not transmissible, or to an increase in other events such as accidents, suicides, etc.

2. Pertaining to or having the character of an epidemic. [Vol. 1, p. 963]

Pandemic [Gk pandēm(os) (from *pan*, neut. sing. of *pas* all + *dēmos* the people) pertaining to all the people]

1 An epidemic affecting a very high proportion of the population of a major geographic region. This term is customarily restricted to diseases such as cholera, plague, and influenza.

2. Relating to a pandemic. [Vol. 3, p. 2067].

World Health Organization

Chapter 3. The role of the World Health Organization (WHO)

Influenza pandemic preparedness plan:
the role of WHO and guidelines for national and regional planning

Geneva, Switzerland, World Health Organization, April 1999, p. 3-20
WHO/CDS/CSR/EDC/99.1 - https://apps.who.int/iris/handle/10665/66155

The Pandemic will be declared when the new virus sub-type has been shown to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns **indicating that serious morbidity and mortality is likely in at least one segment of the population**. Onset shall be defined as that point in time when WHO has confirmed that a virus with a new haemagglutinin sub-type compared to recent epidemic strains is beginning to spread from one or more initial foci. Depending on the amount of early warning, this phase may or may not have been preceded by the above-described series of increasing levels of preparedness (p. 14).

3.3 Phase 1: Confirmation of onset of pandemic

The Pandemic will be declared when the new virus sub-type has been shown to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that serious morbidity and mortality is likely in at least one segment of the population. Onset shall be defined as that point in time when WHO has confirmed that a virus with a new haemagglutinin sub-type compared to recent epidemic strains is beginning to spread from one or more initial foci. Depending on the amount of early warning, this phase may or may not have been preceded by the above-described series of increasing levels of preparedness.

p. 18

TABLE 1: PREPAREDNESS LEVELS FOR INTER-PANDEMIC, PANDEMIC AND POST-PANDEMIC PERIODS

	PHASE	CHARACTERIZED BY:	EXPLANATION	ACTIONS TO BE TAKEN BY WHO
INTER-PANDEMIC PERIOD	**PHASE 0**		No indications of any new virus type have been reported	WHO will: **co-ordinate** a program of international surveillance for influenza in humans, with the assistance of four Collaborating Centres.
	PHASE 0, PREPAREDNESS LEVEL 1	Appearance of a new influenza strain in a human case	This Preparedness Level will exist following the first report(s) of isolation of a novel virus sub-type, without clear evidence of spread of such a virus or of outbreak activity associated with the new virus.	**announce**, with the help of its task force and after international consultation, this Preparedness Level 1. **co-ordinate** international efforts to assist national and local authorities reporting the potential pandemic virus in confirming the infection of a human by a novel strain. **heighten** activities of the laboratory surveillance laboratory network.
	PHASE 0, PREPAREDNESS LEVEL 2	Human infection confirmed	This Preparedness Level will exist when it has been confirmed that two or more human infections have occurred with a new virus sub-type, but where the ability of the virus to readily spread from person-to-person and cause multiple outbreaks of disease leading to epidemics remains questionable.	**announce**, with the help of its task force and after international consultation, this Preparedness Level 2. **encourage** and assist the country, where initial cases were detected, to enhance surveillance and diagnosis, and organize special investigations designed to increase understanding of the possible transmission and impact of the new virus. **develop** a case definition to be used in surveillance for a new virus sub-type. **invite** a group of countries to participate in determination of the prevalence of antibody to the new virus in the general population. **promote** enhanced surveillance activity regionally or internationally. **promote** development and evaluation of candidates for production of vaccines against the novel influenza strain. **promote** development of reagents necessary to determine the identity and potency of vaccines prepared with the new strain. **promote** contingency planning for pre-clinical and clinical trials of vaccines. **promote** the development of strategies for the most efficient use of newly developed vaccines. **recommend** that national health authorities take contingency steps that will facilitate activation of their National Pandemic Preparedness Plans.

World Health Organization

Chapter 3. The role of the World Health Organization (WHO)

Influenza pandemic preparedness plan:
the role of WHO and guidelines for national and regional planning

Geneva, Switzerland, World Health Organization, April 1999, p. 3-20
WHO/CDS/CSR/EDC/99.1 - https://apps.who.int/iris/handle/10665/66155

p. 19

TABLE 1: PREPAREDNESS LEVELS FOR INTER-PANDEMIC, PANDEMIC AND POST-PANDEMIC PERIODS, continued

PHASE	CHARACTERIZED BY:	EXPLANATION	ACTIONS TO BE TAKEN BY WHO	
PHASE 0, PREPAREDNESS LEVEL 3	Human transmission confirmed	This Preparedness Level will exist when human transmission of the new virus sub-type has been confirmed through clear evidence of person-to-person spread in the general population, such as secondary cases resulting from contact with an index case, with at least one outbreak lasting over a minimum two week period in one country.	**announce**, with the help of its task force and after international consultation, Preparedness Level 3. **disseminate** the case definition to be used in surveillance for the new virus sub-type. **facilitate** the distribution to all interested manufacturers of candidate vaccine viruses developed as part of the Preparedness Level 2 activities. **convene** its experts for influenza vaccine composition to develop, disseminate and encourage co-ordinated clinical trials of vaccines against the new strain. **convene** its experts for vaccine composition to develop ways most likely to make vaccines widely available throughout the world. **enhance** further its information dissemination to provide timely reports of the status of investigations of the new virus, its spread, and the development of responses to it. **contact** vaccine manufacturers and national governments about capacity and plans for production and international distribution of a vaccine to the new virus. **encourage** international co-ordination for purchase and distribution of vaccine among different countries. **provide** general guidelines to national health authorities based on the best available information to assist individual countries that are determining their course of action.	INTER-PANDEMIC PERIOD
PHASE 1	Confirmation of onset of pandemic	The onset of a new pandemic will be declared when WHO has confirmed that a virus with a new haemagglutinin sub-type compared to recent epidemic strains is beginning to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that serious morbidity and mortality is likely in at least one segment of the population.	**announce**, with the help of its task force and after international consultation, the onset of a new influenza Pandemic: Phase 1. **make** recommendations for composition and use (doses and schedules) of vaccines, and organize consultations that are intended to facilitate vaccine production and distribution in the most equitable manner possible. **issue** guidance on the best use of available anti-viral drugs against the new virus. **national** response measures should be initiated as rapidly as possible according to pre-determined national pandemic plans, updated to take account of specific characteristics of the new sub-type and knowledge of vaccine availability. **enhance** further its monitoring and reporting of the global spread and impact of the virus. **seek** support in mobilization of resources for countries with limited capacities through partnership with different organizations and international relief agencies. **work** with regional offices as appropriate to encourage common activities among nations facing similar challenges from the pandemic.	PANDEMIC PERIOD

World Health Organization

Chapter 3. The role of the World Health Organization (WHO)

Influenza pandemic preparedness plan:
the role of WHO and guidelines for national and regional planning

Geneva, Switzerland, World Health Organization, April 1999, p. 3-20
WHO/CDS/CSR/EDC/99.1 - https://apps.who.int/iris/handle/10665/66155

p. 20

TABLE 1: PREPAREDNESS LEVELS FOR INTER-PANDEMIC, PANDEMIC AND POST-PANDEMIC PERIODS, continued

	PHASE	CHARACTERIZED BY:	EXPLANATION	ACTIONS TO BE TAKEN BY WHO
PANDEMIC PERIOD	**PHASE 2**	Regional and multi-regional epidemics	This Preparedness Level will exist when outbreaks and epidemics are occurring in multiple countries, and spreading region by region across the world.	**announce**, with the help of its task force and after international consultation the onset of the influenza Pandemic: Phase 2. **continue** to work with regional offices as appropriate to encourage common activities among nations. **continue** monitoring and reporting of the global spread and impact of the virus. **continue** to organize the distribution of vaccines in the most equitable manner possible. **update** guidance on the best use of available anti-viral drugs against the new virus. **seek** further support in mobilization of resources for countries with limited capacities.
	PHASE 3	End of first pandemic wave	The increase in outbreak activity in the initially affected countries or regions has stopped or reversed, but outbreaks and epidemics of the new virus are still occurring elsewhere.	**announce**, with the help of its task force and after international consultation, the onset of the influenza Pandemic: Phase 3. **continue** to work with regional offices as appropriate to encourage common activities among nations. **continue** monitoring and reporting of the global spread and impact of the virus. **continue** to organize the distribution of vaccines in the most equitable manner possible. **update** guidance on the best use of available anti-viral drugs against the new virus. **seek** further support in mobilization of resources for countries with limited capacities.
	PHASE 4	Second or later waves of the pandemic	Based on past experiences, at least a second severe wave of outbreaks caused by the new virus would be expected to occur within 3-9 months of the initial epidemic in many countries.	**announce**, with the help of its task force and after international consultation, the onset of the influenza Pandemic: Phase 4. **continue** monitoring and reporting of the global spread and impact of the virus. **estimate** the remaining needs for vaccines. **estimate** the availability of anti-viral drugs. **seek** further support in mobilization of resources for countries with limited capacities.
POST-PANDEMIC PERIOD	**PHASE 5**	End of the pandemic (back to Phase 0)	WHO will report when the Pandemic Period has ended, which is likely to be after 2-3 years.	**Assessment** of the overall impact of the pandemic. **Evaluation** of "lessons learned" from the pandemic that will assist in responding to future pandemics. **Update** of the WHO influenza Pandemic Plan.

There is a definition of the Pandemic phases, but there is no definition of what 'Pandemic' means

World Health Organization

Informal consultation on influenza pandemic preparedness in countries with limited resources

Kuala Lumpur, WHO, 23–25 June 2004, p. 1.
WHO/CDS/CSR/GIP/2004.1
https://web.archive.org/web/20050429013329/http://www.who.int/csr/resources/publications/influenza/CDS_CSR_GIP_2004_1.pdf

Background

An influenza pandemic occurs with the appearance of a new influenza virus against which none of the population has any immunity. This results in several simultaneous epidemics worldwide with enormous numbers of cases and deaths. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics resulting from a new influenza virus are likely to be established quickly around the world.

A new influenza virus: how it could cause a pandemic

Influenza A and B are two of the three types of influenza viruses associated with annual outbreaks and epidemics of influenza. These epidemics are the result of minor changes in the influenza viruses that enable them to evade the immunity people have developed after either previous infections with the viruses or in response to vaccinations.

Only influenza A virus can cause pandemics. When a major change in either one or both of the influenza A virus surface proteins occurs spontaneously, no one has immunity to this completely new virus. When the virus also has the capacity to spread from person to person, a pandemic can occur.

World Health Organization

Dr. Lee Jong-Wook
Director-General World Health Organization

Foreword
Avian influenza: assessing the pandemic threat

Geneva, WHO, January 2005. WHO/CDS/2005.29
https://apps.who.int/iris/handle/10665/68985

Foreword.

Influenza pandemics are associated with high morbidity, excess mortality, and social and economic disruption. There were three such pandemics in the twentieth century: in 1918, 1957, and 1968. During 2004, the world moved closer to a further pandemic than it has been at any time since 1968.

In the past, pandemics have announced themselves with a sudden explosion of cases which took the world by surprise. This time, we have been given a clear warning. During 2004, large parts of Asia experienced unprecedented outbreaks of highly pathogenic avian influenza, caused by the H5N1 virus, in poultry. The virus crossed the species barrier to infect humans, with a high rate of mortality.

...

Preparedness for a pandemic presents a dilemma: what priority should be given to an unpredictable but potentially catastrophic event, when many existing and urgent health needs remain unmet? In such a situation, it is useful to put together all the known facts that can help us to see where we stand, what can happen, and what must be done. That is the purpose of this publication. (p. 3)

Avian influenza: assessing the pandemic threat

World Health Organization

Foreword

Influenza pandemics are associated with high morbidity, excess mortality, and social and economic disruption. There were three such pandemics in the twentieth century: in 1918, 1957, and 1968. During 2004, the world moved closer to a further pandemic than it has been at any time since 1968.

In the past, pandemics have announced themselves with a sudden explosion of cases which took the world by surprise. This time, we have been given a clear warning. During 2004, large parts of Asia experienced unprecedented outbreaks of highly pathogenic avian influenza, caused by the H5N1 virus, in poultry. The virus crossed the species barrier to infect humans, with a high rate of mortality. Monitoring of the evolving situation, coordinated by WHO, has produced many signs that a pandemic may be imminent. This time, the world has an opportunity to defend itself against a virus with pandemic potential before it strikes.

Preparedness for a pandemic presents a dilemma: what priority should be given to an unpredictable but potentially catastrophic event, when many existing and urgent health needs remain unmet? In such a situation, it is useful to put together all the known facts that can help us to see where we stand, what can happen, and what must be done. That is the purpose of this publication.

Предисловие

Пандемии гриппа характеризуются высокой заболеваемостью, значительной смертностью и социально-экономическими потрясениями. В 20-м веке было три таких пандемии: в 1918, 1957 и 1968 гг. В течение 2004 год мир, как никогда близко, начиная с 1968 г, подошел к порогу следующей пандемии.

В прошлом пандемии «объявляли сами себя» путем неожиданного и стремительного нарастания числа заболеваний, и это было для всех сюрпризом. В настоящее же время мы подвергаемся обоснованному беспокойству. В 2004 г. на значительной территории Азии произошла большая вспышка птичьего гриппа, вызванного чрезвычайно патогенным для человека вирусом H5N1, распространенным среди домашней птицы. Вирус преодолел межвидовой барьер и вызвал тяжелые заболевания у людей с высоким процентом смертельных исходов. Наблюдение за развитием ситуации, инициированное ВОЗ, выявило множество признаков, указывающих на то, что может надвигаться пандемия. Сейчас человечество имеет возможности защитить себя от вируса, обладающего пандемическим потенциалом, до того как она начнется.

1. Introduction

Influenza pandemics (worldwide epidemics) have occurred at irregular and unpredictable intervals, and have been associated with substantial morbidity, mortality and economic cost.

The influenza A virus can cause pandemics and these occur as a result of changes in the virus leading to a sub-type to which no one has immunity, that can spread easily among humans and can give rise to serious disease. Appearance of such a subtype may lead to several simultaneous epidemics worldwide resulting in high numbers of cases and deaths and placing an immense burden on healthcare systems.

With increasing globalization and urbanization, epidemics caused by a new influenza virus are likely to spread rapidly around the world. It is not possible to state when an influenza pandemic is likely to occur but the risk is considered real enough to justify preparations being made

1. Введение

В прошлом пандемии (глобальные эпидемии) гриппа развивались нерегулярно с непредсказуемыми интервалами между ними и сопровождались высокой заболеваемостью и смертностью, а также значительными экономическими потерями.

Пандемии могут быть вызваны вирусом гриппа типа А; они возникают в результате изменений вируса, которые приводят к появлению подтипов, к которым ни у одного человека нет иммунитета; вирусы этого подтипа могут легко распространяться среди людей и приводить к возникновению серьезных заболеваний.

Появление вирусов нового подтипа может приводить к одновременному развитию в мире нескольких вспышек, что приводит к появлению огромного числа случаев заболеваний и смертей; это оказывает выраженное негативное влияние на все системы здравоохранения.

По мере усиления глобализации и урбанизации эпидемии, обусловленные новыми типами вируса гриппа могут очень быстро распространяться по всему земному шару. Совершенно невозможно предсказать, когда может возникнуть очередная пандемия гриппа, однако существующий риск ее развития является достаточно реальным для того, чтобы считать проведенные подготовительные мероприятия оправданными.

1. Introduction

Influenza pandemics (worldwide epidemics) have occurred at irregular and unpredictable intervals and have been associated with substantial morbidity, mortality and economic cost. The influenza A virus can cause pandemics: these occur as a result of changes in the virus leading to a sub-type to which no one has immunity, which can spread easily among humans and which can give rise to serious disease.

Appearance of such a subtype may lead to several simultaneous epidemics worldwide, resulting in high numbers of cases and deaths and placing an immense burden on health care systems. With increasing globalization and urbanization, epidemics caused by a new influenza virus are likely to spread rapidly around the world.

The previous three pandemics occurred in 1918, 1957 and 1968 and although it is not possible to predict when an influenza pandemic is likely to occur, the risk is considered real enough to justify preparations being made. Preparing for the next influenza pandemic requires multidisciplinary support and collaboration from partners at the local, national, regional and international levels. National preparedness planning is not a quick or simple process and will require time, a multisectoral approach, the involvement of communities and commitment from the highest political levels. The failure to control the H5N1 avian influenza (AI) outbreak in south-east Asia, including incidental human cases, and the introduction of this virus into the European Region have put the Region on alert. As a result, controlling AI outbreaks and preventing the spread of the H5N1 virus to humans have placed avian influenza firmly on the agenda of influenza preparedness planning.

An influenza pandemic

An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with high numbers of cases and deaths. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world.

An influenza pandemic

An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with high numbers of cases and deaths. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world.

A new influenza virus: how it could cause a pandemic

Annual outbreaks and epidemics of influenza are caused by influenza A and B viruses. They are the result of minor changes in the influenza viruses that enable them to evade the immunity we have developed after previous infections with the viruses, or in response to vaccinations.

Only the influenza A virus can cause pandemics. When a major change in either one or both surface proteins of the influenza A virus occurs, no one will be immune, as this represents a completely new virus. When the virus also has the capacity to spread from person to person, a pandemic may develop.

Global pandemics have been reported for many hundreds of years. The best documented pandemics occurred in 1918 (H1N1, the Spanish flu), 1957 (H2N2, the Asian flu) and 1968 (H3N2, the Hong Kong flu).

Une pandémie de grippe

Une pandémie (ou une épidémie mondiale) de grippe se produit lorsqu'apparaît un nouveau sous-type de virus grippal dont personne n'est à l'abri. Plusieurs épidémies peuvent se déclarer simultanément dans le monde, faisant un grand nombre de cas et de décès. Les épidémies dues au nouveau virus grippal sont d'autant plus susceptibles de se propager rapidement dans le monde que les transports internationaux et l'urbanisation s'intensifient.

Un nouveau virus grippal: comment il pourrait provoquer une pandémie Des flambées et des épidémies de grippe sont imputables chaque année aux virus grippaux A et B. Elles résultent des légers changements qui s'opèrent dans les virus grippaux et qui leur permettent de faire fi de l'immunité que nous avons acquise à la suite d'infections antérieures dues à ces virus, ou par la vaccination.

Seul le virus grippal A est capable de provoquer des pandémies. En cas de changement majeur dans l'une des deux, ou les deux, protéines de surface du virus grippal A, personne n'est protégé car on se trouve en présence d'un virus entièrement nouveau. Lorsque le virus peut également se transmettre d'une personne à une autre, une pandémie est possible.

Des pandémies mondiales sont signalées depuis des siècles. Celles pour lesquelles on dispose des informations les plus complètes remontent à 1918 (H1N1, grippe espagnole), 1957 (H2N2, grippe asiatique) et 1968 (H3N2, grippe de Hong Kong).

Conséquences d'une pandémie de grippe

Les pandémies de grippe survenues au XXe siècle sont responsables de millions de décès, de bouleversements sociaux et de pertes économiques considérables dans le monde entier. Les spécialistes de la grippe conviennent de l'éventualité d'une autre pandémie mais ils ne peuvent dire quand elle se produira. (p. vi-vii)

Avian Influenza: Responding to the Pandemic Threat

Regional Health Forum, WHO South-East Asia Region, New Delhi, 2005, 9(2): 9
https://apps.who.int/iris/handle/10665/205801?search-result=true&query=Regional+health+forum&scope=&rpp=10&sort_by=score&order=desc&page=2

Introduction

The emergence of avian influenza caused by the highly pathogenic H5N1 Influenza A virus is a cause for grave concern since this virus has the potential to trigger a pandemic.

Since December 2003, when the current outbreak was first detected in the Republic of Korea, avian influenza has been expanding geographically causing disease in both poultry and humans in an unprecedented number of countries. So far, the virus is not easily transmitted from poultry to humans nor from human-to-human. Nevertheless, the continuous occurrence of H5N1 infection in birds and humans is raising concerns about the emergence of a new virus with a potential to spread rapidly among humans causing a pandemic like the ones which occurred in the past.

The influenza A virus is considered highly unstable. Every year it undergoes minor changes known as antigenic "drift" which result in evolution of a strain slightly different from the previous year. However, a major antigenic change occurs, either through mutation of the same virus or through reassortment or mixing of influenza viruses

This reassortment process, known as antigenic "shift", can create completely new subtypes of influenza viruses to which populations have no immunity. The lack of immunity coupled with a virus that can replicate in humans and that is able to transmit efficiently among humans can lead to a pandemic. Spreading at great speed the pandemic may cause high morbidity, excess mortality, social disruption and even economic collapse.

Avian Influenza: Responding to the Pandemic Threat

Asheena Kualakdina and Jai P. Narain*

Introduction

The emergence of avian influenza caused by the highly pathogenic H5N1 Influenza A virus is a cause for grave concern since this virus has the potential to trigger a pandemic. Since December 2003, when the current outbreak was first detected in the Republic of Korea, avian influenza has been expanding geographically causing disease in both poultry and humans in an unprecedented

belonging to humans and animals. This re-assortment process, known as antigenic "shift", can create completely new subtypes of influenza viruses to which populations have no immunity. The lack of immunity coupled with a virus that can replicate in humans and that is able to transmit efficiently among humans can lead to a pandemic. Spreading at great speed the pandemic may cause high morbidity, excess mortality, social disruption and even economic collapse.

WHO global influenza preparedness plan: the role of WHO and recommendations for national measures before and during pandemics

Geneva, Switzerland, World Health Organization, 2005, p. 2
WHO/CDS/CSR/GIP/2005.5
https://apps.who.int/iris/handle/10665/68998

NEW PHASES	OVERARCHING PUBLIC HEALTH GOALS
Interpandemic period	
Phase 1. No new influenza virus subtypes have been detected in humans. An influenza virus subtype that has caused human infection may be present in animals. If present in animals, the risk[a] of human infection or disease is considered to be low.	Strengthen influenza pandemic preparedness at the global, regional, national and subnational levels.
Phase 2. No new influenza virus subtypes have been detected in humans. However, a circulating animal influenza virus subtype poses a substantial risk[a] of human disease.	Minimize the risk of transmission to humans; detect and report such transmission rapidly if it occurs.
Pandemic alert period	
Phase 3. Human infection(s) with a new subtype, but no human-to-human spread, or at most rare instances of spread to a close contact.[b]	Ensure rapid characterization of the new virus subtype and early detection, notification and response to additional cases.
Phase 4. Small cluster(s) with limited human-to-human transmission but spread is highly localized, suggesting that the virus is not well adapted to humans.[b]	Contain the new virus within limited foci or delay spread to gain time to implement preparedness measures, including vaccine development.
Phase 5. Larger cluster(s) but human-to-human spread still localized, suggesting that the virus is becoming increasingly better adapted to humans, but may not yet be fully transmissible (substantial pandemic risk).	Maximize efforts to contain or delay spread, to possibly avert a pandemic, and to gain time to implement pandemic response measures.
Pandemic period	
Phase 6. Pandemic: increased and sustained transmission in general population.[b]	Minimize the impact of the pandemic.

[a] The distinction between ***phase 1*** and ***phase 2*** is based on the risk of human infection or disease resulting from circulating strains in animals. The distinction is based on various factors and their relative importance according to current scientific knowledge. Factors may include pathogenicity in animals and humans, occurrence in domesticated animals and livestock or only in wildlife, whether the virus is enzootic or epizootic, geographically localized or widespread, and/or other scientific parameters.

[b] The distinction between ***phase 3***, ***phase 4*** and ***phase 5*** is based on an assessment of the risk of a pandemic. Various factors and their relative importance according to current scientific knowledge may be considered. Factors may include rate of transmission, geographical location and spread, severity of illness, presence of genes from human strains (if derived from an animal strain), and/or other scientific parameters.

There is a definition of the Pandemic phases, but there is no definition of what 'Pandemic' means

World Health Organization

ANNEX 1
Recommendations for nonpharmaceutical public health interventions

WHO global influenza preparedness plan: the role of WHO and recommendations for national measures before and during pandemics

Geneva, Switzerland, World Health Organization, 2005, p. 46
WHO/CDS/CSR/GIP/2005.5
https://apps.who.int/iris/handle/10665/68998

Given a pandemic strain causing significant morbidity and mortality in all age groups and the absence of a vaccine, authorities should seriously consider introducing population-wide measures to reduce the number of cases and deaths. Decisions can be guided by mathematical and economic modelling. If modelling indicates a reduction in the absolute numbers of cases and deaths, decisions to introduce measures involving multiple government sectors will then need to balance the protection of priority functions against the risk of social and economic disruption.

[a] Y = yes, should be done at this phase; N = no, not necessary at this phase; C = should be considered; NR = not relevant.

[b] Quality and type of mask depend on risk group. Cases: surgical mask; health-care workers: N95 or equivalent; others: depends on risk.

[c] Implementation depends on adequate supplies and may require a global stockpile with a prenegotiated targeting and delivery strategy to ensure availability in the area where a potential pandemic virus emerges. Prophylactic use will depend on evidence of effectiveness. Targeted use is required because of potential for drug resistance, side-effects and limited supplies. Targeted use might consider: public prevention; protection of health-care workers; protection of other essential service providers; individual treatment.

[d] Given a pandemic strain causing significant morbidity and mortality in all age groups and the absence of a vaccine, authorities should seriously consider introducing population-wide measures to reduce the number of cases and deaths. Decisions can be guided by mathematical and economic modelling. If modelling indicates a reduction in the absolute numbers of cases and deaths, decisions to introduce measures involving multiple government sectors will then need to balance the protection of priority functions against the risk of social and economic disruption.

[e] Could be considered as an emergency measure to avert or delay a pandemic.

=>
There is a definition of the pandemic phases but no definition of what 'Pandemic' means.
Nevertheless, there will be high morbidity and mortality if a pandemic strain emerges.

World Health Organization

Regional influenza pandemic preparedness plan (2006-2008)

WHO Regional Office for South-East Asia, New Dehli, 2006, p. 2-3.
https://apps.who.int/iris/handle/10665/205803

1. Background and Rationale

If the human-to-human transmission is not contained quickly the modern means of transportation will rapidly seed a pandemic. Experts estimate that the next pandemic may cause more than 1 billion cases and up to 7.4 million deaths. During the current H5N1 outbreaks more than 150 million birds have been destroyed or died and the direct economic costs to affected countries amount to $ 8-12 billion. A modest pandemic lasting over one year might cause a loss as high as 3% of Asian GDP and 0.5% of world GDP. This is presently equivalent to about $ 150-200 billion in GDP.

Therefore, in addition to high morbidity and mortality, the next pandemic may cause massive social, political and economic disruption. (p. 2)

...

It is obvious that the countries with pandemic preparedness plans and pre-existing core capacities would respond promptly and limit the adverse impact of a pandemic. Effective preparedness would ensure that all the needed resources, expertise and services are mobilized and deployed rapidly to reduce the morbidity, mortality and social disruption to the minimum. Establishment/strengthening of core capacities to preempt and control the next pandemic would also be useful in dealing with other epidemic and public health emergencies. The countries need to accelerate strengthening their response mechanisms and to fill-up the existing gaps. (p. 3)

If the human-to-human transmission is not contained quickly the modern means of transportation will rapidly seed a pandemic. Effective preparedness would ensure that all the needed resources, expertise and services are mobilized and deployed rapidly to reduce the morbidity, mortality and social disruption to the minimum. Establishment/strengthening of core capacities to preempt and control the next pandemic would also be useful in dealing with other epidemic and public health emergencies. The countries need to accelerate strengthening their response mechanisms and to fill-up the existing gaps.

World Health Organization

Pandemic influenza preparedness and mitigation in refugee and displaced populations

Geneva, WHO, 2008
WHO/HSE/EPR/DCE/2008.3
https://web.archive.org/web/20081112132223/http://www.who.int/diseasecontrol_emergencies/HSE_EPR_DCE_2008_3rweb.pdf

1. Rationale

An influenza pandemic occurs when a novel influenza virus appears against which the human population has limited or no immunity, and which transmits efficiently from person to person, resulting in several simultaneous epidemics worldwide with the potential for considerable morbidity and mortality. With the increase in global transport and communications, as well as in urbanization and overcrowded conditions, epidemics caused by the new influenza virus are likely to quickly take hold around the world. The impact of a novel pandemic influenza virus on refugee and displaced populations is expected to be severe. Risk factors for increased morbidity and mortality from pandemic influenza in these populations include:

- overcrowding, particularly in camp settings;
- poor access to basic health-care services that will be accentuated by a pandemic;
- limited or no access to hospitals for supportive care and treatment of complications;
- high prevalence of malnutrition;
- high incidence/prevalence of other communicable diseases, e.g. acute respiratory illnesses, malaria, diarrhoeal diseases;
- logistic challenges resulting from often remote locations or ongoing active conflict;
- lack of adequate surveillance/early warning systems to detect cases or clusters;
- poor links to national disease surveillance systems;
- possible exclusion from national influenza preparedness and response activities;
- lack of trained and equipped staff to investigate outbreaks and manage ill persons.

1. RATIONALE

An influenza pandemic occurs when a novel influenza virus appears against which the human population has limited or no immunity, and which transmits efficiently from person to person, resulting in several simultaneous epidemics worldwide with the potential for considerable morbidity and mortality. With the increase in global transport and communications, as well as in urbanization and overcrowded conditions, epidemics caused by the new influenza virus are likely to quickly take hold around the world. The impact of a novel pandemic influenza virus on refugee and displaced populations is expected to be severe. Risk factors for increased morbidity and mortality from pandemic influenza in these populations include:

Pandemic influenza preparedness and response: a WHO guidance document

Geneva, Switzerland, World Health Organization, April 2009
https://www.who.int/publications/i/item/9789241547680
https://web.archive.org/web/20090509051754/http://www.who.int/csr/disease/influenza/PIPGuidance09.pdf
https://www.ncbi.nlm.nih.gov/books/NBK143062/

Executive Summary

Influenza pandemics are unpredictable but recurring events that can have severe consequences on human health and economic well being worldwide. Advance planning and preparedness are critical to help mitigate the impact of a global pandemic. This WHO guidance document Pandemic influenza preparedness and response significantly updates and replaces WHO global influenza preparedness plan: The role of WHO and recommendations for national measures before and during pandemics which was published in 2005. (p. 8)

...

Overview of the major changes

The revised Guidance:

1. Retains the six-phase structure but regroups and redefines the phases to more accurately reflect pandemic risk and the epidemiological situation based upon observable phenomena. (8)

...

The WHO pandemic phases

The phases are applicable globally and provide a framework to aid countries in pandemic preparedness and response planning. The use of a six-phased approach has been retained to facilitate incorporation of new recommendations into existing national plans. However, the pandemic phases have been re-defined (Table 1). To facilitate planning at national and global levels, Phases 1-3 and 5-6 have been grouped to include common action points. In addition, the time after the first pandemic wave has been elaborated into post peak and post pandemic periods. When making a change to the global phase, WHO will carefully consider all available information to assess if the criteria for a new phase have been met. (10)

TABLE 1
PANDEMIC PHASE DESCRIPTIONS

	DESCRIPTION
PHASE 1	No animal influenza virus circulating among animals has been reported to cause infection in humans.
PHASE 2	An animal influenza virus circulating in domesticated or wild animals is known to have caused infection in humans and is therefore considered a specific potential pandemic threat.
PHASE 3	An animal or human-animal influenza reassortant virus has caused sporadic cases or small clusters of disease in people, but has not resulted in human-to-human transmission sufficient to sustain community-level outbreaks.
PHASE 4	Human-to-human transmission (H2H) of an animal or human-animal influenza reassortant virus able to sustain community-level outbreaks has been verified.
PHASE 5	The same identified virus has caused sustained community level outbreaks in two or more countries in one WHO region.
PHASE 6	In addition to the criteria defined in Phase 5, the same virus has caused sustained community level outbreaks in at least one other country in another WHO region.
POST-PEAK PERIOD	Levels of pandemic influenza in most countries with adequate surveillance have dropped below peak levels.
POSSIBLE NEW WAVE	Level of pandemic influenza activity in most countries with adequate surveillance rising again.
POST-PANDEMIC PERIOD	Levels of influenza activity have returned to the levels seen for seasonal influenza in most countries with adequate surveillance.

2. Background

Influenza pandemics are unpredictable but recurring events that can have severe consequences on societies worldwide. Since the 16th century, influenza pandemics have been described at intervals ranging between 10 and 50 years4 with varying severity and impact. (13)

...

The precise timing and impact of a future influenza pandemic remains unknown. Developing and sustaining a country's preparedness is challenging, and carries a risk of complacency. (13)

...

While the H5N1 virus is currently the most visible influenza virus with pandemic potential, it is not the only candidate. (14)

...

3.2.2 The designation of the global pandemic phase

The designation of the global pandemic phase will be made by the Director-General of WHO. The designation of a phase will be made consistent with applicable provisions of the IHR (2005) and in consultation with other organizations, institutions, and affected Member States.

...

3.2.5. Providing an early assessment of pandemic severity on health

As soon as possible, WHO will provide an assessment of pandemic severity to help governments determine the level of interventions required as part of their response. As outlined in section 1.1, past influenza pandemics have been associated with varying levels of illness and death. (22)

...

Pandemic severity may be assessed in many ways. One fundamental distinction is an assessment based on direct health effects as opposed to one based upon societal and economic effects. While societal and economic effects may be highly variable from country to country and dependent upon multiple factors (including the effects of the media and the underlying state of preparedness), WHO plans to assess pandemic severity based primarily on observable effects on health. (22)

...

4. The Who Pandemic Phases

The WHO pandemic phases were developed in 1999 and revised in 2005.

The phases are applicable to the entire world and provide a global framework to aid countries in pandemic preparedness and response planning. In this revision, WHO has retained the use of a six-phased approach for easy incorporation of new recommendations and approaches into existing national preparedness and response plans. The grouping and description of pandemic phases have been revised to make them easier to understand, more precise, and based upon observable phenomena. Phases 1-3 correlate with preparedness, including capacity development and response planning activities, while Phases 4-6 clearly signal the need for response and mitigation efforts. Furthermore, periods after the first pandemic wave are elaborated to facilitate post pandemic recovery activities. (24)

...

5. Recommended Actions Before, During and After a Pandemic

...

The use of pharmaceutical interventions to prevent or treat influenza encompasses a range of approaches. Additionally, the successful prevention and treatment of secondary or pre-existing conditions will be a key factor in many settings for reducing the overall burden of illness and death. (28)

World Health Organization

WHO Pandemic Phase Descriptions and Main Actions by Phase (p. 27)

TABLE 3
WHO PANDEMIC PHASE DESCRIPTIONS AND MAIN ACTIONS BY PHASE

	ESTIMATED PROBABILITY OF PANDEMIC	DESCRIPTION	MAIN ACTIONS IN AFFECTED COUNTRIES	MAIN ACTIONS IN NOT-YET-AFFECTED COUNTRIES
PHASE 1	Uncertain	No animal influenza virus circulating among animals has been reported to cause infection in humans.	Producing, implementing, exercising, and harmonizing national pandemic influenza preparedness and response plans with national emergency preparedness and response plans.	
PHASE 2		An animal influenza virus circulating in domesticated or wild animals is known to have caused infection in humans and is therefore considered a specific potential pandemic threat.		
PHASE 3		An animal or human-animal influenza reassortant virus has caused sporadic cases or small clusters of disease in people, but has not resulted in human-to-human transmission sufficient to sustain community-level outbreaks.		
PHASE 4	Medium to high	Human-to-human transmission of an animal or human-animal influenza reassortant virus able to sustain community-level outbreaks has been verified.	Rapid containment.	Readiness for pandemic response.
PHASE 5	High to certain	The same identified virus has caused sustained community-level outbreaks in at least two countries in one WHO region.	Pandemic response: each country to implement actions as called for in their national plans.	Readiness for imminent response.
PHASE 6	Pandemic in progress	In addition to the criteria defined in Phase 5, the same virus has caused sustained community-level outbreaks in at least one other country in another WHO region.		
POST-PEAK PERIOD		Levels of pandemic influenza in most countries with adequate surveillance have dropped below peak levels.	Evaluation of response; recovery; preparation for possible second wave.	-
POSSIBLE NEW WAVE		Level of pandemic influenza activity in most countries with adequate surveillance is rising again.	Response	
POST-PANDEMIC PERIOD		Levels of influenza have returned to the levels seen for seasonal influenza in most countries with adequate surveillance.	Evaluation of response; revision of plans; recovery.	

There is a definition of the Pandemic phases, but there is no definition of what 'Pandemic' means

Guidelines on regulatory preparedness for provision of marketing authorization
of human pandemic influenza vaccines in non-vaccine-producing countries

Annex 7, TRS No 1004. – Geneva, WHO, 31 January 2017. p. 460
https://www.who.int/publications/m/item/trs1004-annex7-pandemic-influenza-vaccine

1. Introduction

An influenza pandemic occurs when a novel influenza A virus emerges against which most people do not have immunity, and spreads rapidly around the world. A pandemic influenza A virus is significantly different from normally circulating human influenza A viruses, with a widespread absence of immunity against the virus observed in the population. As with seasonal influenza viruses, pandemic influenza viruses have the ability to spread easily from human to human and cause disease. This may result in several simultaneous epidemics worldwide with high numbers of cases of clinical disease and deaths, leading to considerable social disruption. Pandemic influenza viruses may evolve from subtypes that previously only circulated in animals or from subtypes currently circulating in humans but sufficiently different antigenically for pre-existing immunity in the population to be low or minimal (an example of the latter case is the 2009 H1N1 influenza pandemic). Influenza viruses that have caused past pandemics have typically originated from animals. Owing to the urgent public health need, strategies to shorten the time between the emergence of a human pandemic influenza virus and the availability of safe and effective pandemic influenza vaccines are one of the highest priorities in global health security.

• An influenza pandemic
• A new influenza virus: how it could cause a pandemic
• Consequences of an influenza pandemic
• Detecting a new pandemic virus
An influenza pandemic
An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world.
A new influenza virus: how it could cause a pandemic
Influenza A and influenza B are 2 of the 3 types of influenza viruses associated with annual outbreaks and epidemics of influenza. The third type, influenza C, causes only mild disease and has not been associated with widespread epidemics or pandemics. Annual outbreaks of influenza are due to minor changes in the surface proteins of the viruses that enable the viruses to evade the immunity humans have developed after previous infections with the viruses or in response to vaccinations.
Only influenza A virus can cause pandemics. When a major change in either 1 or both of their surface proteins occurs spontaneously, no one will have partial or full immunity against infection because it is a completely new virus. If this new virus also has the capacity to spread from person-to-person, then a pandemic is most likely to occur.

Ten things you need to know about pandemic influenza

Geneva, WHO, 14 October 2005

https://web.archive.org/web/20051124014913/www.who.int/csr/disease/influenza/pandemic10things/en/

1. Pandemic influenza is different from avian influenza

Avian influenza refers to a large group of different influenza viruses that primarily affect birds. On rare occasions, these bird viruses can infect other species, including pigs and humans. The vast majority of avian influenza viruses do not infect humans. An influenza pandemic happens when a new subtype emerges that has not previously circulated in humans.

For this reason, avian H5N1 is a strain with pandemic potential, since it might ultimately adapt into a strain that is contagious among humans. Once this adaptation occurs, it will no longer be a bird virus--it will be a human influenza virus. Influenza pandemics are caused by new influenza viruses that have adapted to humans.

2. Influenza pandemics are recurring events

An influenza pandemic is a rare but recurrent event. Three pandemics occurred in the previous century: “Spanish influenza” in 1918, “Asian influenza” in 1957, and “Hong Kong influenza” in 1968. The 1918 pandemic killed an estimated 40–50 million people worldwide. That pandemic, which was exceptional, is considered one of the deadliest disease events in human history. Subsequent pandemics were much milder, with an estimated 2 million deaths in 1957 and 1 million deaths in 1968.

A pandemic occurs when a new influenza virus emerges and starts spreading as easily as normal influenza – by coughing and sneezing. Because the virus is new, the human immune system will have no pre-existing immunity. This makes it likely that people who contract pandemic influenza will experience more serious disease than that caused by normal influenza.

3. The world may be on the brink of another pandemic

Health experts have been monitoring a new and extremely severe influenza virus – the H5N1 strain – for almost eight years. The H5N1 strain first infected humans in Hong Kong in 1997, causing 18 cases, including six deaths. Since mid-2003, this virus has caused the largest and most severe outbreaks in poultry on record. In December 2003, infections in people exposed to sick birds were identified.

Since then, over 100 human cases have been laboratory confirmed in four Asian countries (Cambodia, Indonesia, Thailand, and Viet Nam), and more than half of these people have died. Most cases have occurred in previously healthy children and young adults. Fortunately, the virus does not jump easily from birds to humans or spread readily and sustainably among humans. Should H5N1 evolve to a form as contagious as normal influenza, a pandemic could begin.

4. All countries will be affected

Once a fully contagious virus emerges, its global spread is considered inevitable. Countries might, through measures such as border closures and travel restrictions, delay arrival of the virus, but cannot stop it. The pandemics of the previous century encircled the globe in 6 to 9 months, even when most international travel was by ship. Given the speed and volume of international air travel today, the virus could spread more rapidly, possibly reaching all continents in less than 3 months.

5. Widespread illness will occur

Because most people will have no immunity to the pandemic virus, infection and illness rates are expected to be higher than during seasonal epidemics of normal influenza. Current projections for the next pandemic estimate that a substantial percentage of the world's population will require some form of medical care. Few countries have the staff, facilities, equipment, and hospital beds needed to cope with large numbers of people who suddenly fall ill.

6. Medical supplies will be inadequate

Supplies of vaccines and antiviral drugs – the two most important medical interventions for reducing illness and deaths during a pandemic – will be inadequate in all countries at the start of a pandemic and for many months thereafter. Inadequate supplies of vaccines are of particular concern, as vaccines are considered the first line of defence for protecting populations. On present trends, many developing countries will have no access to vaccines throughout the duration of a pandemic.

7. Large numbers of deaths will occur

Historically, the number of deaths during a pandemic has varied greatly. Death rates are largely determined by four factors: the number of people who become infected, the virulence of the virus, the underlying characteristics and vulnerability of affected populations, and the effectiveness of preventive measures. Accurate predictions of mortality cannot be made before the pandemic virus emerges and begins to spread. All estimates of the number of deaths are purely speculative.

WHO has used a relatively conservative estimate – from 2 million to 7.4 million deaths – because it provides a useful and plausible planning target. This estimate is based on the comparatively mild 1957 pandemic. Estimates based on a more virulent virus, closer to the one seen in 1918, have been made and are much higher. However, the 1918 pandemic was considered exceptional.

8. Economic and social disruption will be great

High rates of illness and worker absenteeism are expected, and these will contribute to social and economic disruption. Past pandemics have spread globally in two and sometimes three waves. Not all parts of the world or of a single country are expected to be severely affected at the same time. Social and economic disruptions could be temporary, but may be amplified in today's closely interrelated and interdependent systems of trade and commerce. Social disruption may be greatest when rates of absenteeism impair essential services, such as power, transportation, and communications.

9. Every country must be prepared

WHO has issued a series of recommended strategic actions [pdf 113kb] for responding to the influenza pandemic threat. The actions are designed to provide different layers of defence that reflect the complexity of the evolving situation. Recommended actions are different for the present phase of pandemic alert, the emergence of a pandemic virus, and the declaration of a pandemic and its subsequent international spread.

10. WHO will alert the world when the pandemic threat increases

WHO works closely with ministries of health and various public health organizations to support countries' surveillance of circulating influenza strains. A sensitive surveillance system that can detect emerging influenza strains is essential for the rapid detection of a pandemic virus.

Six distinct phases have been defined to facilitate pandemic preparedness planning, with roles defined for governments, industry, and WHO. The present situation is categorized as phase 3: a virus new to humans is causing infections, but does not spread easily from one person to another.

Ten things you need to know about pandemic influenza

14 October 2005

1. Pandemic influenza is different from avian influenza.

Avian influenza refers to a large group of different influenza viruses that primarily affect birds. On rare occasions, these bird viruses can infect other species, including pigs and humans. The vast majority of avian influenza viruses do not infect humans. An influenza pandemic happens when a new subtype emerges that has not previously circulated in humans.

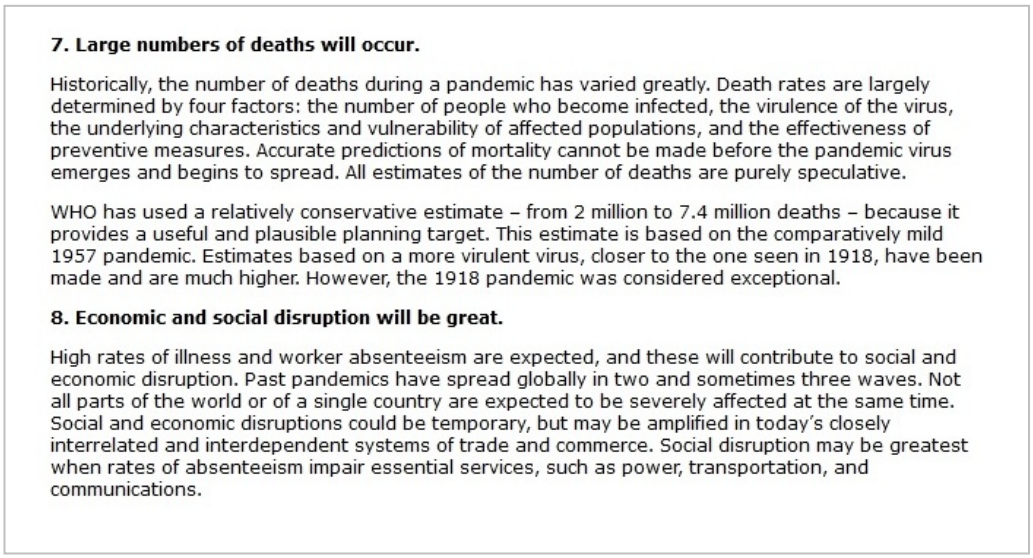
For this reason, avian H5N1 is a strain with pandemic potential, since it might ultimately adapt into a strain that is contagious among humans. Once this adaptation occurs, it will no longer be a bird virus--it will be a human influenza virus. Influenza pandemics are caused by new influenza viruses that have adapted to humans.

2. Influenza pandemics are recurring events.

An influenza pandemic is a rare but recurrent event. Three pandemics occurred in the previous century: "Spanish influenza" in 1918, "Asian influenza" in 1957, and "Hong Kong influenza" in 1968. The 1918 pandemic killed an estimated 40–50 million people worldwide. That pandemic, which was exceptional, is considered one of the deadliest disease events in human history. Subsequent pandemics were much milder, with an estimated 2 million deaths in 1957 and 1 million deaths in 1968.

7. Large numbers of deaths will occur

Historically, the number of deaths during a pandemic has varied greatly. Death rates are largely determined by four factors: the number of people who become infected, the virulence of the virus, the underlying characteristics and vulnerability of affected populations, and the effectiveness of preventive measures. Accurate predictions of mortality cannot be made before the pandemic virus emerges and begins to spread. All estimates of the number of deaths are purely speculative.



7. Large numbers of deaths will occur.

World Health Organization

Dix choses qu'il faut savoir sur la grippe pandémique

Genève, OMS, 14 Octobre 2005

https://web.archive.org/web/20070106055414/www.who.int/csr/disease/influenza/pandemic10things/fr/

1. La grippe pandémique est à distinguer de la grippe aviaire

La grippe aviaire est une maladie provoquée par un important groupe de virus grippaux distincts affectant principalement les oiseaux. Ces virus peuvent très occasionnellement infecter d'autres espèces, notamment le porc et l'homme. Dans leur grande majorité, les virus de la grippe aviaire n'infectent pas l'homme. Une pandémie de grippe humaine survient en cas d'émergence d'un nouveau sous type qui n'a pas circulé auparavant chez l'homme.

Pour cette raison, le virus H5NI de la grippe aviaire est une souche susceptible de donner lieu à une pandémie, car elle pourrait en fin de compte s'adapter à l'homme et devenir contagieuse chez lui. Une fois que cette adaptation aura eu lieu, il ne s'agira plus d'un virus aviaire, mais d'un virus grippal humain. Les pandémies de grippe sont provoquées par de nouveaux virus grippaux qui se sont adaptés à l'homme.

2. Les pandémies de grippe sont des événements récurrents

Une pandémie de grippe est un phénomène rare mais récurrent. On a observé trois pandémies au cours du siècle dernier, la grippe dite espagnole en 1918, la grippe dite asiatique en 1957 et la grippe dite de Hong Kong en 1968. La pandémie de 1918 a fait entre 40 et 50 millions de morts dans le monde selon les estimations. Cette pandémie, tout à fait exceptionnelle, est considérée comme une des plus meurtrières de l'histoire de l'humanité. Le bilan des pandémies qui ont suivi était beaucoup plus léger puisque selon les estimations celle de 1957 a fait 2 millions de morts et celle de 1968 1 million de morts.

Une pandémie survient lors de l'émergence d'un nouveau virus grippal qui commence à se propager aussi facilement que celui de la grippe "normale" (saisonnière), c'est-à-dire par la toux et les éternuements. Comme il s'agit d'un nouveau virus, le système immunitaire de l'homme n'a aucune défense contre lui. La pathologie provoquée par ce virus de la grippe pandémique risque donc d'être plus grave que celle que provoque un virus grippal normal.

7. Le nombre de décès sera considérable

Les précédents historiques montrent que le nombre de décès au cours d'une pandémie est très variable. Les taux de mortalité sont principalement déterminés par quatre facteurs : le nombre de personnes infectées, la virulence du virus, les caractéristiques propres et la vulnérabilité des populations touchées et, enfin, l'efficacité des mesures de prévention. Il est impossible d'établir des prévisions exactes concernant la mortalité avant que le virus de la pandémie n'apparaisse et ne commence à se propager. Toutes les estimations relatives au nombre de décès qui lui seraient imputables sont purement spéculatives.

L'OMS a tablé sur une estimation relativement prudente – de 2 à 7,4 millions de décès – qui constitue une cible utile et plausible pour la planification. Cette estimation est fondée sur la pandémie relativement modérée de 1957. Les estimations fondées sur un virus plus virulent, plus proche de celui de 1918, sont beaucoup plus élevées. Toutefois, la pandémie de 1918 était considérée comme exceptionnelle.

8. Une importante désorganisation socio-économique est à prévoir

Il faut s'attendre à un nombre élevé de cas et, par conséquent, à un fort taux d'absentéisme, ce qui contribuera à une désorganisation socio économique. Les précédentes pandémies se sont propagées en deux et parfois en trois vagues. On ne s'attend pas à ce que toutes les parties du monde ou d'un même pays soient gravement touchées en même temps. Les perturbations socio-économiques peuvent être temporaires, mais elles peuvent être amplifiées par l'étroite interdépendance à laquelle on assiste aujourd'hui en matière d'échanges commerciaux. Elles risquent d'attendre un pic lorsque l'absentéisme entravera le fonctionnement des services essentiels – eau, gaz, électricité, transports et communications.

7. Le nombre de décès sera considérable

Les précédents historiques montrent que le nombre de décès au cours d'une pandémie est très variable. Les taux de mortalité sont principalement déterminés par quatre facteurs: le nombre de personnes infectées, la virulence du virus, les caractéristiques propres et la vulnérabilité des populations touchées et, enfin, l'efficacité des mesures de prévention. Il est impossible d'établir des prévisions exactes concernant la mortalité avant que le virus de la pandémie n'apparaisse et ne commence à se propager. Toutes les estimations relatives au nombre de décès qui lui seraient imputables sont purement spéculatives.

World Health Organization

Десять фактов, которые вы должны знать о пандемическом гриппе

Женева, ВОЗ, 14 октября 2005

https://web.archive.org/web/20070107192045/http://www.who.int/csr/disease/influenza/pandemic10things/ru/index.html

1. Пандемический грипп отличается от птичьего гриппа

Переносчиком птичьего гриппа является большая группа различных вирусов гриппа, которые поражают главным образом птиц. В редких случаях вирусы птичьего гриппа могут инфицировать другие биологические виды, в том числе свиней и людей. В подавляющем большинстве случаев вирусы птичьего гриппа людей не инфицируют. Пандемический грипп возникает тогда, когда появляется новый подтип гриппа, который раньше у людей не наблюдался.

Вирус птичьего гриппа H5N1 представляет собой один из штаммов гриппа, обладающего пандемическим потенциалом, поскольку в конечном итоге он может адаптироваться и принять форму штамма, заразного для людей. После того как произойдет эта адаптация, он уже будет не вирусом птичьего гриппа, а вирусом гриппа, поражающего людей. Пандемии гриппа вызываются новыми вирусами гриппа, которые адаптировались к организму человека.

2. Пандемия гриппа - явление повторяющееся

Пандемия гриппа - явление редкое, но повторяющееся. В прошлом столетии было три таких пандемии: "испанский грипп" в 1918 г., "азиатский грипп" в 1957 г. и "гонконгский грипп" в 1968 году. В 1918 г. пандемия гриппа унесла, по оценкам, 40-50 миллионов человек во всем мире. Эта пандемия, которая носила исключительный характер, считается одной из самых крупных причин смертельных исходов в истории человечества. Последующие пандемии были гораздо слабее: приблизительно два миллиона смертей в 1957 г. и один миллион в 1968 году.

Пандемия возникает тогда, когда появляется новый вирус гриппа и начинает распространяться с той же легкостью, что и вирус обычного гриппа, - воздушно-капельным путем при кашле и чихании. Поскольку этот вирус новый, иммунная система человека не выработала иммунитет на этапе, предшествующем его появлению. Это может привести к тому, что в случае пандемического гриппа среди людей болезнь будет протекать гораздо тяжелее, чем в случае обычного гриппа.

3. Сегодня мир, возможно, стоит на грани очередной пандемии

Специалисты в области здравоохранения уже почти в течение восьми лет ведут наблюдение за новым и чрезвычайно опасным вирусом гриппа - штаммом H5N1. В 1997 г. штаммом H5N1 было инфицировано в Гонконге 18 человек, из которых шесть умерли. С середины 2000 г. этот вирус послужил причиной крупнейших и серьезнейших вспышек болезни среди домашней птицы, которые когда-либо были известны истории. В декабре 2003 г. были выявлены случаи инфицирования людей, работавших с больными птицами.

С тех пор в результате проведения лабораторных анализов было подтверждено свыше 100 случаев гриппа среди людей в четырех азиатских странах (Вьетнаме, Индонезии, Камбодже и Таиланде), причем более половины этих людей скончались. В большинстве случаев эта болезнь поражала детей и взрослых в молодом возрасте, которые ранее не болели. К счастью, этот вирус не может легко передаться от птицы к человеку или быстро и устойчиво распространяться среди людей. Если штамм H5N1 станет таким же заразным, как и вирус обычного гриппа, то это может положить начало новой пандемии.

4. Пандемия затронет все страны

После того как появится легко передающийся от человека к человеку вирус, его распространение по всему миру, как считается, будет неизбежным. Страны могут задержать появление вируса на своей территории, приняв такие меры, как перекрытие границ и ввод ограничений на международные поездки, однако остановить его они не смогут. В прошлом веке пандемии распространялись по всей планете за 6-9 месяцев, хотя в то время международные поездки осуществлялись в большинстве случае морским путем. С учетом сегодняшней скорости и объема международных перевозок воздушным транспортом этот вирус может распространиться гораздо быстрее, проникнув, по всей вероятности, на все континенты менее чем за три месяца.

5. Болезнь приобретет широкомасштабный характер

Поскольку никакого иммунитета против вируса пандемического гриппа у большинства людей не будет, показатели инфицирования и заболевания, как ожидается, будут выше, чем в случае сезонных эпидемий обычного гриппа. Нынешние прогнозы в отношении следующей пандемии дают основание сделать вывод о том, что значительной доле мирового населения потребуется медицинская помощь в той или иной форме. Помочь большому количеству внезапно заболевших людей могут лишь немногие страны, у которых есть необходимые для этого сотрудники, объекты инфраструктуры, оборудование и места в больницах.

6. Запасов товаров медицинского назначения будет недостаточно

На начальном этапе пандемии и в течение многих месяцев спустя все страны будут испытывать нехватку запасов вакцин и антивирусных препаратов - двух важнейших продуктов медицинского назначения, которые могут привести к снижению заболеваемости и смертности в ходе пандемии. Недостаточные запасы вакцин вызывают особую озабоченность, поскольку считается, что именно вакцины выполняют функцию "передовой линии обороны", которая может уберечь население. Исходя из нынешних тенденций, можно утверждать, что в течение всей пандемии у многих развивающихся стран не будет доступа к нужным вакцинам.

7. Пандемия унесет жизнь большого числа людей

Данные за прошедший период свидетельствуют о том, что количество смертельных случаев в ходе той или иной пандемии варьируется в широких пределах. Показатели смертности в значительной мере определяются четырьмя факторами: числом инфицированных людей, вирулентностью вируса, исходными характеристиками и уязвимостью затронутого населения и эффективностью профилактических мер. Точно предсказать уровень смертности до того, как появится и начнет распространяться пандемический вирус, невозможно. Все оценки по поводу количества смертей носят чисто гипотетический характер.

В этом плане ВОЗ использует относительно осторожную оценку - от 2 до 7,4 миллиона смертей, - поскольку с точки зрения планирования работы она представляет собой практичный и правдоподобный ориентир. В основе этой оценки лежат данные о сравнительно слабой пандемии 1957 года. Были также сделаны оценки в расчете на более вирулентный штамм вируса, близкий к тому, который свирепствовал в 1918 г., и они оказались гораздо выше. Вместе с тем считается, что пандемия 1918 г. носила исключительный характер.

8. Произойдет существенное нарушение социально-экономических связей

Следует ожидать, что уровень заболеваемости и невыхода на работу будет высоким, что будет способствовать нарушению социально-экономических связей. В прошлом пандемии распространялись по всему миру двумя и иногда тремя волнами. Вряд ли можно ожидать,

что все страны мира и все районы каждой отдельной страны будут серьезно затронуты в одно и то же время. Социально-экономические нарушения могут носить временный характер, однако сегодня, в условиях тесной связи и взаимозависимости производственных и коммерческих систем, они могут усилиться. Нарушения социальных связей проявятся особенно сильно в тех случаях, когда в результате невыхода на работу нарушится работа основных секторов, таких как энергоснабжение, транспорт и связь.

9. К пандемии должна подготовиться каждая страна

В порядке реагирования на угрозу пандемического гриппа ВОЗ публикует серию рекомендуемых стратегических мер. Эти меры предусматривают создание различных "эшелонов обороны", которые отражают степень сложности изменяющейся ситуации. На нынешнем этапе предупреждения о пандемии, на этапе появления пандемического вируса и на этапе объявления пандемии и ее последующего распространения в мире рекомендуемые меры будут разными.

10. ВОЗ будет оповещать мировое сообщество по мере увеличения угрозы пандемии

ВОЗ тесно сотрудничает с министерствами здравоохранения и различными государственными медико-санитарными организациями в целях оказания помощи странам в укреплении системы эпиднадзора за циркуляцией штаммов гриппа. Для быстрого обнаружения пандемического вируса нужны быстрореагирующие системы эпиднадзора, которые позволяют выявить новые штаммы вируса гриппа.

Для облегчения работы по обеспечению готовности к пандемии было определено шесть отдельных этапов, на каждом из которых правительствам, промышленности и ВОЗ отводится своя роль. По этой классификации нынешняя ситуация находится на этапе 3: новый вирус является причиной инфекции людей, но не передается с легкостью от одного человека к другому.

1. Пандемический грипп отличается от птичьего гриппа.

Переносчиком птичьего гриппа является большая группа различных вирусов гриппа, которые поражают главным образом птиц. В редких случаях вирусы птичьего гриппа могут инфицировать другие биологические виды, в том числе свиней и людей. В подавляющем большинстве случаев вирусы птичьего гриппа людей не инфицируют. Пандемический грипп возникает тогда, когда появляется новый подтип гриппа, который раньше у людей не наблюдался.

7. Пандемия унесет жизнь большого числа людей.

Данные за прошедший период свидетельствуют о том, что количество смертельных случаев в ходе той или иной пандемии варьируется в широких пределах. Показатели смертности в значительной мере определяются четырьмя факторами: числом инфицированных людей, вирулентностью вируса, исходными характеристиками и уязвимостью затронутого населения и эффективностью профилактических мер. Точно предсказать уровень смертности до того, как появится и начнет распространяться пандемический вирус, невозможно. Все оценки по поводу количества смертей носят чисто гипотетический характер.

An influenza pandemic
An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world.
A new influenza virus: how it could cause a pandemic
Annual outbreaks of influenza are due to minor changes in the surface proteins of the viruses that enable the viruses to evade the immunity humans have developed after previous infections with the viruses or in response to vaccinations. When a major change in either one or both of their surface proteins occurs spontaneously, no one will have partial or full immunity against infection because it is a completely new virus. If this new virus also has the capacity to spread from person-to-person, then a pandemic will occur.
WHO consultation on priority public health interventions before and during an influenza pandemic
Outbreaks of influenza in animals, especially when happening simultaneously with annual outbreaks in humans, increase the chances of a pandemic, through the merging of animal and human influenza viruses. During the last few years, the world has faced several threats with pandemic potential, making the occurrence of the next pandemic just a matter of time.

- WHO checklist for influenza pandemic preparedness planning
- Influenza A(H1N1)

Introduction

Outbreaks of influenza in animals, especially when happening simultaneously with annual outbreaks of seasonal influenza in humans, increase the chances of a pandemic, through the merging of animal and human influenza viruses. During the last few years, the world has faced several threats with pandemic potential, making the occurrence of the next pandemic a matter of time.

Consequences of an influenza pandemic

In the past, influenza pandemics have resulted in increased morbidity and mortality and great social disruption. In the 20th century, the most severe influenza pandemic occurred in 1918 -1919 and caused an estimated 40–50 million deaths world wide. Current epidemiological models project that a pandemic could result in 2 to 7.4 million deaths globally.

If an influenza pandemic were to occur today, we could expect:

- the pandemic virus to spread rapidly due to the high level of global traffic;
- vaccines, antiviral agents and antibiotics to treat secondary infections to be in short supply, with a period of several months before any vaccine becomes available;
- medical facilities to be overwhelmed with demands to care for both influenza and non-influenza patients;
- widespread illness to result in sudden and potentially significant shortages of personnel to provide essential community services.

Detecting a new pandemic virus

Continuous global surveillance of influenza is key to the early detection of a virus with pandemic potential. WHO has a network of more than 120 National Influenza Centres in over

Potential consequences

In the past, influenza pandemics have resulted in increased death and disease and great social disruption. In the 20th century, the most severe influenza pandemic occurred in 1918-1919 and caused an estimated 40 to 50 million deaths world wide. Current epidemiological models project that a pandemic could result in two to 7.4 million deaths globally.

If an influenza pandemic were to occur today, we could expect the virus to spread rapidly due to the interconnected nature of the world and the high level of global travel.

If the pandemic evolved to become severe and widespread over time, we could also expect:

- vaccines, antiviral agents and antibiotics to treat secondary infections to be in high demand, and potentially in short supply;
- medical facilities to be strained with demands to care for both influenza and non-influenza patients;
- potentially significant shortages of personnel to provide essential community services.

Effective pandemic preparedness around the world is essential to mitigate the effects of a pandemic, particularly if it becomes severe.

What is an influenza pandemic?

A disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity. With the increase in global transport, as well as urbanization and overcrowded conditions in some areas, epidemics due to a new influenza virus are likely to take hold around the world, and become a pandemic faster than before. WHO has defined the phases of a pandemic to provide a global framework to aid countries in pandemic preparedness and response planning. Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic.

Potential consequences

In the past, influenza pandemics have resulted in increased death and disease and great social disruption . . .

流行病和大流行病预警和反应 (EPR)

防范大流行

世界卫生组织，日内瓦，2009 年 7 月 25 日

https://web.archive.org/web/20090611072627/http://www.who.int/csr/disease/influenza/pandemic/zh/index.html

什么是流感大流行？

如果某一疾病的病例数超过正常水平，即为疾病流行疫情。大流行指全球范围内流行某一疾病。当一种新流感病毒出现且人类对其不具免疫力时，即可能发生流感大流行。随着全球交通运输更为便利以及一些地区的城市化和过度拥挤问题，新流感病毒导致的流行病可能会在世界各地肆虐，并以空前速度演变成为大流行病。世卫组织确定了大流行警戒级别，为协助各国制定大流行防范和应对计划提供了全球框架。从疾病和死亡人数看，有的大流行影响甚微，有的则造成严重后果。大流行的严重程度可能会在大流行期间有所变化。

可能造成的后果

历史上，**流感大流行导致大量人生病和死亡**，对社会造成严重冲击。1918-1919 年流感大流行是20世纪最严重的大流感疫情，估计世界各地约有4千万至5千万人丧生。目前，根据现有流行病学模型预测，大流行可导致全球200万至740万人死亡。

Une pandémie de grippe

Une pandémie (ou une épidémie mondiale) de grippe se produit lorsqu'apparaît un nouveau sous-type de virus grippal dont personne n'est à l'abri. Plusieurs épidémies peuvent se déclarer simultanément dans le monde, faisant un grand nombre de cas et de décès. Les épidémies dues au nouveau virus grippal sont d'autant plus susceptibles de se propager rapidement dans le monde que les transports internationaux et l'urbanisation s'intensifient.

Un nouveau virus grippal: comment il pourrait provoquer une pandémie Des flambées et des épidémies de grippe sont imputables chaque année aux virus grippaux A et B. Elles résultent des légers changements qui s'opèrent dans les virus grippaux et qui leur permettent de faire fi de l'immunité que nous avons acquise à la suite d'infections antérieures dues à ces virus, ou par la vaccination.

Seul le virus grippal A est capable de provoquer des pandémies. En cas de changement majeur dans l'une des deux, ou les deux, protéines de surface du virus grippal A, personne n'est protégé car on se trouve en présence d'un virus entièrement nouveau. Lorsque le virus peut également se transmettre d'une personne à une autre, une pandémie est possible.

Des pandémies mondiales sont signalées depuis des siècles. Celles pour lesquelles on dispose des informations les plus complètes remontent à 1918 (H1N1, grippe espagnole), 1957 (H2N2, grippe asiatique) et 1968 (H3N2, grippe de Hong Kong).

Conséquences d'une pandémie de grippe

Les pandémies de grippe survenues au XXe siècle sont responsables de millions de décès, de bouleversements sociaux et de pertes économiques considérables dans le monde entier. Les spécialistes de la grippe conviennent de l'éventualité d'une autre pandémie mais ils ne peuvent dire quand elle se produira. (p. vi-vii)

- Полная информация о гриппе A(H1N1)
Что представляет собой пандемия гриппа?
Эпидемия той или иной болезни возникает тогда, когда число случаев этой болезни превышает обычный уровень. Пандемия представляет собой эпидемию той или иной болезни в мировом масштабе. Пандемия гриппа может возникнуть в том случае, когда появляется какой-либо новый вирус гриппа, против которого у людей нет иммунитета. В условиях увеличения масштабов перевозок на глобальном уровне, а также урбанизации и перенаселенности в некоторых районах, эпидемия, вызванная каким-либо новым вирусом гриппа, может распространиться во всем мире и превратиться в пандемию быстрее, чем это наблюдалось ранее. В целях создания глобальной системы оказания странам помощи в обеспечении готовности к пандемии и планирования необходимых мер ВОЗ определила соответствующие фазы пандемии. Пандемии - в зависимости от степени тяжести вызванной ими болезни и смертности - могут быть слабыми или серьезными, причем в ходе пандемии уровень ее серьезности может меняться.
Потенциальные последствия
В прошлом пандемии гриппа приводили к повышению уровня смертности и заболеваемости и существенным социальным нарушениям. В 20-м веке самая серьезная пандемия гриппа отмечалась в 1918-1919 гг. и, по оценкам, унесла жизнь от 40 до 50 миллионов человек в мире. В соответствии с нынешними эпидемиологическими моделями какая-либо пандемия может, по прогнозам, унести жизнь от двух до 7,4 миллиона человек на нашей планете.
Если бы пандемия гриппа возникла сегодня, то можно было бы вполне ожидать, что в связи с взаимосвязанным характером нашего мира и широкими масштабами глобальных перевозок вирус будет распространяться быстро.

Emerging Infections: Influenza Pandemic Facts

CDC, Media Relations Division, 31 December 1997
http://web.archive.org/web/20050503194920/http://www.cdc.gov/od/oc/media/pressrel/panfacts.htm

Pandemics result from the emergence of an influenza A virus that is novel for the human population.

The hallmark of pandemic influenza is excess mortality – the number of deaths observed during an epidemic of influenza-like illness in excess of the number expected.

During this century, pandemics occurred in 1918, 1957, and 1968.

1918-19 "Spanish flu" A(H1N1) – caused the highest known influenza-related mortality – at least 500,000 deaths in the United States, and 20 million worldwide.

1957-58 "Asian flu" A(H2N2) – 70,000 deaths in the United States.

1968-69 "Hong Kong flu" A(H3N2) – 34,000 deaths in the United States.

Although mortality rates associated with the recent pandemics of 1957 and 1968 were confined primarily to the elderly and chronically ill, both pandemics were associated with high rates of illness and social disruption, with combined economic losses of approximately $32 billion (in 1995 dollars).

The potential impact of an influenza virus in humans depends on whether there is protective immunity in the population, the virus' ability to be passed from person to person and its virulence (ability to cause severe illness or death).

Influenza viruses undergo two kinds of change. One is a series of mutations overtime that cause a gradual evolution of the virus, known as antigenic drift. The other is an abrupt change in the surface antigen proteins, known as anitgenic shift, thus suddenly creating a new subtype of the virus.

When antigenic shift occurs, the population does not have antibody protection against the virus.

Birds are the primary reservoir for influenza viruses. All 15 recognized influenza A subtypes have been found in birds. Only 3 influenza subtypes have circulated widely in humans until this summer: H3N2, H1N1, and H2N2.

In most years in the United States, influenza is responsible for 10,000-40,000 excess deaths, 50,000-300,000 hospitalizations, and approximately $1-3 billion in direct costs for medical care.

Influenza Pandemic

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness[1].

Pandémie d'influenza

Une pandémie d'influenza se produit lorsqu'un nouveau virus grippal contre lequel la population humaine n'a aucune immunité apparaît et que ce virus cause plusieurs épidémies simultanées à l'échelle mondiale avec de nombreux morts et maladies[1].

Influenza Pandemic

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness.[1]

Influenza A and influenza B are 2 of the 3 types of influenza viruses associated with annual outbreaks and epidemics of influenza. The third type, influenza C, causes only mild disease and has not been associated with widespread epidemics or pandemics. Annual outbreaks of influenza are due to minor changes in the surface proteins of the viruses that enable the viruses to evade the immunity humans have developed after previous infections with the viruses or in response to vaccinations.[2]

Only the influenza A virus can cause pandemics. When a major change in either one or both of their surface proteins occurs spontaneously, no one will have partial or full immunity against infection because it is a completely new virus. If this new virus also has the capacity to spread from person-to-person, then a pandemic is most likely to occur.[3]

Pandémie d'influenza

Une pandémie d'influenza se produit lorsqu'un nouveau virus grippal contre lequel la population humaine n'a aucune immunité apparaît et que ce virus cause plusieurs épidémies simultanées à l'échelle mondiale avec de nombreux morts et maladies.[1]

L'influenza de type A et l'influenza de type B sont deux des 3 types de virus grippaux associés aux flambées et aux épidémies annuelles d'influenza. Le troisième type, l'influenza de type C, cause seulement des maladies bénignes et n'a pas été associé à des épidémies ou des pandémies étendues. Les flambées annuelles d'influenza sont dues aux changements mineures dans les protéines de surface des virus qui leurs permettent d'esquiver l'immunité que les humains ont développé par suite d'infections antérieures des virus ou de vaccinations.[2]

Seul le virus d'influenza de type A peut causer des pandémies. Lorsqu'un changement important dans un ou les deux de leurs protéines de surface se produit, aucune personne ne sera immunisée, partiellement ou complètement, contre l'infection, car c'est une nouvelle forme du virus. Si ce nouveau virus a aussi la capacité de se propager d'une personne à une autre, alors les chances de pandémie sont très élevées.[3]

Геннадий Онищенко

О подготовке к возможной пандемии гриппа

Постановление № 11

Роспотребнадзор, 27 декабря 2004
http://62.rospotrebnadzor.ru/content/postanovlenie-ot-27122004-no-11-o-podgotovke-k-vozmozhnoy-pandemii-grippa

Я, Главный государственный санитарный врач Российской Федерации Г.Г.Онищенко, проанализировав эффективность действующей системы эпидемиологического надзора за гриппом и острыми респираторными заболеваниями (ОРЗ) установил, что в связи с вероятностью возникновения пандемии гриппа возникла необходимость внесения корректив с целью предотвращения или снижения ущерба здоровью населения и экономике страны от распространения нового высокопатогенного вируса гриппа.

В последние годы регистрируются локальные очаги гриппозной инфекции с высокой смертностью среди инфицированных людей, имевших контакт с инфицированными птицами. Такие вспышки гриппа имели место в 1997 г. в Гонконге (вирус гриппа А H5N1), в 2003 г. в Нидерландах (вирус гриппа А H7N7), в 2003-2004 гг. в Таиланде, Вьетнаме, Китае и других странах Юго-Восточной Азии (вирус гриппа А H5N1). Заболевания гриппом среди людей отличались крайне тяжелым клиническим течением и высокой летальностью, достигнув в Таиланде и Вьетнаме 70%, что свидетельствует об изменении биологических свойств птичьих вирусов в сторону усиления патогенности для человека.

Всемирная организация здравоохранения (ВОЗ) прогнозирует появление в ближайшие годы нового антигенного варианта вируса гриппа, что может привести к развитию крупной пандемии гриппа с 4-5 кратным ростом заболеваемости и 5-10 кратным ростом смертности.

Все это требует координации деятельности заинтересованных федеральных органов исполнительной власти, органов исполнительной власти субъектов Российской Федерации, органов управления здравоохранением, органов, осуществляющих государственный санитарно-эпидемиологический надзор, ветеринарный надзор с целью улучшения эпидемиологического надзора и повышения готовности к возможному возникновению пандемии гриппа.

В целях обеспечения готовности к пандемическому распространению вируса гриппа в Российской Федерации и в соответствии с Федеральным законом О санитарно-эпидемиологическом благополучии населения от 30.03.1999 г. № 52-ФЗ ст. 51 (Собрание законодательства Российской Федерации, 1999, № 14, ст. 1650) постановляю:

Los Angeles Times

Kathleen Doheny

Avian Flu risk low for tourists, but experts fear virus mutation

Los Angeles Times (Los Angeles, CA), 13 March 2005, Sun, p. L3.
https://www.newspapers.com/image/192659938/?terms=%22with%20enormous%20numbers%20of%20deaths%20and%20illness%22&match=1

As temperatures remain cool in Asian countries, the Centers for Disease Control and Prevention in Atlanta predicts more out-breaks of avian, or bird, flu among poultry there. Although the current outbreak is not considered risky for most tourists, epidemiologists are worried the viruses could mutate and acquire the ability to spread efficiently from person to person.

Last month, the CDC elevated its outbreak notice on avian influenza to a travel health precaution because the disease had spread in Vietnam. As of press time Tuesday, 60 human cases of avian flu had been diagnosed in Cambodia, Thailand and Vietnam, including 43 deaths. So few cases may not seem like cause for alarm, but health experts worldwide fear that if the avian flu virus and a human influenza virus were to simultaneously infect a person, it could form a new, mutated virus.

"And the new virus might acquire the ability to spread easily person to person in a sustained manner" and result in a global pandemic of the H5N1, the strain of bird flu now occurring, says Dr. Tim Uyeki, an epidemiologist with the CDC influenza branch.

"An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness," according to the World Health Organization.

For now, the risk for most tourists to Asia is minuscule, especially if they take simple precautions and aren't exposed to infected poultry.

Travelers shouldn't cancel their plans, Uyeki says. "There are no travel restrictions. We aren't saying, 'Don't visit those countries.' The situation right now is that H5N1 is going from poultry to people, and in a small number of cases there has been probably limited person-to-person transmission."

The viral infection typically strikes wild birds but can also affect chickens and other poultry. Humans are infected when exposed to sick birds, uncooked poultry or contaminated surfaces, the CDC says.

Symptoms include fever, cough and sore throat. The infection in people is often fatal, and no human vaccine is available. The human influenza vaccine offers "zero protection" against H5N1, Uyeki cautions.

The first documented human infections were in Hong Kong in 1997, WHO reports. In that outbreak, 18 people were hospitalized and six died.

"There has not been one case in an American," Uyeki says. The risk for an American who is going to these countries of get-ting infected with H5N1 is extremely low. It is extremely unlikely unless they are . . . having direct contact with a sick or dead [infected] chicken or duck or drinking raw duck blood, a delicacy in Vietnam. Avoid any con-tact with poultry, period."

For other recommendations, see the CDC website for travelers, *www.cdc.govItravel.*

An Orange County physician agrees with Uyeki. "There are so few human cases that I don't think restricting travel is an issue yet," says Dr. Cherie Hinchliffe, a Laguna Beach internist who specializes in travel medicine. She tells her patients, "Stay away from farms and open-air markets. Avoid domesticated birds. Stay away from zoos and aviaries." If you are taking children, she adds, supervise their hand washing "because they are usually poor hand washers and often have their hands in their mouths." If you are ill, cancel the travel plans, she says. "It might make you more susceptible."

UNITED STATES SENATE

On Examining an Effective and Immediate Public Health Response in the Aftermath of a Terrorism Attack

Hearing of the Committee on Health, Education, Labor, and Pensions,
United States Senate, One Hundred Ninth Congress, First Session.
Roundtable Discussion: When terror strikes –
Preparing an effective and Immediate Public Health Response

United States. Congress. Senate. July 14, 2005, p. 8

Response to questions of the committee by Leah Devlin

An important role for the Federal Government is to work collaboratively to assure a stable, predictable market for biodefense medical countermeasures and to address related liability issues. Public health, with an adequately built and maintained in-frastructure, can then guarantee timely distribution of these countermeasures to ul-timately protect the American population from preventable illness and death.

The three main strategies needed to maintain a robust public health infrastructure are a commitment to an all hazards approach, a trained workforce, and sustainable funding. These three factors, commitment, people and resources, will see the Nation into a safer, more protected, and better-prepared future. The multiple agencies and industries involved in the food chain must integrate and coordinate their surveillance, risk vulnerability, and mitigation plans. Human health, livestock and crop protection must be viewed as a single system for the development of surveillance systems, standardized plans, and training for local, State, Federal, and industry stakeholders.

Question 1. What additional incentives or other measures will ensure the timely availability of sufficient amounts of effective biodefense medical countermeasures, and is the cost of such incentives acceptable?

Answer 1. Biodefense medical countermeasures are one essential component of an effective preparedness and response effort which must also include surveillance, early detection, quarantine, isolation, distribution of biodefense medical counter-measures including mass vaccination, mass care and public communications. Having said this, at this critical point in history, the alignment of incentives in the produc-tion of biodefense medical countermeasures (mainly vaccines and anti-infective drugs) must hinge on the ability of Government, business, and public health to adequately plan together for these exigencies. This fundamental concept will be articulated using the examples of pandemic influenza, a natural event, and the dispersal of anthrax spores, a deliberate event.

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in simultaneous epidemics world-wide with enormous numbers of deaths and illness.

Because of the ongoing and unprecedented spread of highly pathogenic avian influenza type H5N1 in SE Asia, the global alarm for the next human influenza pandemic has been sounded by the WHO. The toll in the United States using a mid-point estimate of a 25 percent attack rate and a 5 percent mortality rate would result in 3 million deaths and 10 million hospitalizations, 10 to 100-fold greater than the numbers experienced during a typical wintertime flu season.

4 UK Influenza Pandemic Contingency Plan

Executive summary

Pandemics of influenza have swept the world from time to time throughout history, three times in the last century. They caused widespread illness, large numbers of deaths, including among children and young adults, and huge societal disruption, concentrated in just a few weeks. There is currently rising concern that a new influenza virus with pandemic potential will emerge and spread, and a further pandemic can be expected. When that will be is not known, but the consequences, when it does, will be serious. Around a quarter of the population could be affected, with over 50,000 deaths in the UK alone. This could be over one or more waves, each lasting around 3 months.

When that will be is not known, but the consequences, when it does, will be serious. Around a quarter of the population could be affected, with over 50,000 deaths in the UK alone. This could be over one or more waves, each lasting around 3 months.

This document updates the March 2005 UK Influenza Pandemic Contingency Plan. It sets the scene and provides the overall framework for the UK's response to an influenza pandemic. It is based on current advice from the World Health Organization for national pandemic plans. The response is divided into phases, starting with work to be done before a pandemic or potential pandemic emerges, followed by a stepwise escalating response as a pandemic evolves.

Influenza Pandemic

Sometimes a completely new form of influenza virus appears and starts to cause illness in humans. When this happens, it is easy for this new subtype to spread from person to person since most people will not have immunity to the new strain of virus. An influenza pandemic results if many people around the world become ill and die from such a virus. Influenza pandemics have occurred three to four times per century.

Pandemic Influenza Preparedness & Response Plan

Big Sandy Community & Technical College Environmental Health & Safety Committeeю
Incorporated as an Appendix To Big Sandy Community &
Technical College Safety Manual & Crisis Management Plan

Big Sandy, Community 8c Technical College, April 2009, p. 2.
https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&ved=2ahUKEwjWt8K7xOr_AhUESmwGHZG-AXA4ChAWegQIDRAB&url=https%3A%2F%2Fbigsandy.kctcs.edu%2Fcurrent-students%2Fmedia%2Fpandemicinfluenzaplan.pdf&usg=AOvVaw3mpzjlB-oAS-o5UgZMZv3i&opi=89978449

Planning Overview

The Office of the President for Kentucky Community and Technical College System (KCTCS) having recognized the potential threat of a world-wide influenza pandemic, and the potential impact it could have on all Kentucky Community and Technical Colleges instructed all locations to develop a plan to respond to the effects such an outbreak would create.

...

This Pandemic Influenza Plan was written specifically for Big Sandy Community and Technical College (BSCTC) by the appointed Crisis Management Team. It is the intent of this plan to identify key important actions BSCTC may need to undertake for the preparation of, and response to an influenza outbreak resulting in business interruption. Continued plan surveillance and updating will be required to ensure that the Pandemic Influenza Plan effectively addresses the unique needs of BSCTC.

Background

According to the World Health Organization (WHO), “An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several simultaneous epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due to the new influenza virus are likely to quickly take hold around the world.”

Influenza is a highly contagious respiratory virus that is responsible for annual epidemics in the United States and other countries. Each year an average of 200,000 people are hospitalized and 36,000 die in the U.S. from influenza infection or a secondary complication. During an influenza pandemic the level of illness and death from influenza will likely increase dramatically worldwide.

The impact of an influenza pandemic on the local economy and business processes could be devastating. It is estimated that 15-35% of the population will be affected. There is a potential for high levels of illness and death, as well as significant disruption to society and our economy, making planning for the next influenza pandemic imperative.

The August Forecast

Patrick Wood and Dr. Russell Blaylock, MD

Pandemic Nonsense: Flying Pig Flu

Are globalist fear-mongers driving the media to panic the public into universal healthcare solutions?
Or federally-mandated vaccinations?

The August Forecast, 28 April 2009
https://web.archive.org/web/20090710180814/http://www.augustreview.com/news_commentary/general/pandemic_nonsense:_flying_pig_flu_20090428118/

By definition, a "pandemic" is an epidemic that is geographically widespread. Fear-mongers are always careful to add the innuendo that millions of people could and probably will die, as in the Spanish Flu pandemic of 1918 that killed between 20 and 100 million people worldwide.

Excuse me, but how does the death of even a few hundred equate to 20 million?

Mexico, not the usual Southeast Asia, is the origin of the latest flu outbreak. It has spread in limited numbers to several continents. Almost all of the deaths, limited as they are, are in Mexico. The ratio of deaths to infections is very small.

Again, how does this outbreak even remotely qualify as a pandemic?
Answer: It does not!

Scientists and virus researchers are baffled because the genetic makeup of the virus contains elements of human, swine and bird flu from three geographic regions: North America, Europe and Asia. Until now, this has been unknown in nature, but not theoretically impossible.

see: New flu combines pig, bird, human virus
https://web.archive.org/web/20090731105917/http://www.globalresearch.ca/index.php?context=va&aid=14550
see: Mexico Seeks to Stop Spread of Deadly Flu
https://web.archive.org/web/20090429114232/http://www.npr.org/templates/story/story.php?storyId=103459566

Because of its unique genetic makeup, this writer proposes calling it the "flying pig flu", or FPF, instead.

This writer is hardly qualified to write with authority about the scientific side of viruses. However, after reading several authoritative papers on swine and avian flu, several observations can be made.

In the world of virus experts, there are two types of researchers: *Observers* and *Experimenters*.

Observers

Most researchers are highly trained scientific observers. These "Sherlock Holmes" scientists examine the pathology of virus development. Where did it originate? What animals or human were involved? Did the infected humans handle animals? Are certain strains limited to geography? You get the idea.

Without good observers, we would know little about the source or spread of different viral strains.

There are several good Internet resources where the findings of research observers are published. (For instance, see H5N1 - Ultimate News on mutation)

We should be thankful for astute observers who can untangle mysteries that would otherwise not be understood.

Experimenters

A minority of researchers are experimenters. This group is worrisome.

Experimenters establish their playground in trying to create different types of viruses in order to measure their effect on test animals.

Such was the case at Baxter AG, when such an experiment was "accidentally" released as a live virus in a vaccine distributed to 18 countries. (See Baxter: Product contained live bird flu virus). In this case, the live H5N1 virus (avian flu) was combined with the much more contagious (human) H3N2 virus.

Experts say that it is almost impossible for Baxter to make such a grievous error by accident. Czech newspapers, where the story was originally broken, suggest it was a rogue employee or a mole that purposely mixed the virus' together, but nothing has been proven as yet. Baxter is now under great suspicion that it is attempting to foment a pandemic that would bring hundreds of millions of dollars in revenue to supply its normal H5N1 vaccine.

Another example is the Center for Disease Control in Atlanta, Georgia. In a 2004 report, CDC to mix avian, human flu viruses in pandemic study, it was noted that,

"*The Centers for Disease Control and Prevention (CDC) will soon launch experiments designed to combine the H5N1 virus and human flu viruses and then see how the resulting hybrids affect animals. The goal is to assess the chances that such a "reassortant" virus will emerge and how dangerous it might be."*

Critics worried that such a "franken-virus" could itself cause a pandemic if it escaped from its creators. The CDC's only response is that their facilities were more secure than others who had experienced breaches of some sort in years past.

Why would the CDC risk world exposure to an artificially created virus? According to the above report, it was done in the name of preparedness.

As mentioned above, experimenters are a worrisome lot. Real world experience indicates that they are generally overconfident in their scientific prowess and in their abilities to contain the unpredictable fruit of their experiments.

Conclusion

There are some big problems with the current outbreak of flying pig flu. If there has been foul play, it may never be brought to light. Still, tough questions need to be asked:

- While it is not unknown for pigs to become infected with the H5N1 virus, the result has *always* been a less-lethal and less-contagious virus than avian flu by itself. Why is this epidemic so obviously contagious?
- How would genetic code from three continents find its way into a single strain in Mexico City?
- Is this virus an escaped experiment from a project gone awry?
- If man-made and not accidentally released, then who released it, and why?

As we contemplate these questions, watch the stock prices of major pharma companies skyrocket as they gear up to sell billions in vaccines. Watch governments as they declare mandatory vaccination programs. Watch the Obama administration as it railroads universal healthcare through Congress.

Indeed, *flying pig flu* may be just the right name for whatever is responsible for this particular flu outbreak.

In the meantime, we can reopen this case when pigs fly or when 10 million or so people have died, whichever comes first.

Discussing the Scary Word 'Pandemic': Public Health prof. David Ozonoff is keeping cool, but yes, he's worried

Boston University Today, 29 April 2009
https://www.bu.edu/articles/2009/discussing-the-scary-word-pandemic/

As swine flu continues to spread, the World Health Organization yesterday raised its alert level to Phase 4, indicating that "the likelihood of a pandemic has increased, but not that a pandemic is inevitable." Phase 6 would mean that a global pandemic is under way.

...

People in Mexico were wearing face masks in public yesterday. Photo by hmerinomx

For insights into the swine flu scare, BU Today put some questions to epidemiologist David Ozonoff, a School of Public Health professor of environmental health. BU Today:

What is swine flu and is this the first time it's been transmitted from human to human?

Ozonoff: Influenza is actually a group of viruses, and most infect animals. A few infect humans. Pigs get the flu and have for a long time. It has been true that there have been times when swine influenza has passed to human beings. In fact, the current strain, H1N1, was at one point thought to be the source of the 1918 pandemic. But more recent thinking is that it was likely the other way around – that we gave it to pigs in 1918, and that we likely got it from an avian source.

Pigs infected with H1N1 get sick, but it usually doesn't pass to humans. Every year, the CDC gets a report of one or two cases of people infected with swine flu, but in recent years it's been a couple or three. And there have been instances – in 1976 and 1988 – when there was a small outbreak with human-to-human transmission, but it burned itself out after one generation. The current situation seems to be different. It's probable that several generations of this virus have been passed through human-to-human transmission, and it seems to be more easily transmissible.

Don't thousands of people die every year from "normal" flu? Why is swine flu more dangerous?

So far, it seems to look a lot like seasonal influenza. But the difference is that it's a type of flu to which humans have never, or very rarely, been exposed. We have a globe's worth of immunologically naïve people. So any flu virus for which there's basically no natural immune response is a recipe for a pandemic virus, which means a sustained human-to-human transmission happening in many places in the world. Now, "pandemic" is a scary word, because it's applied to the 1918 flu, but it's also applied to other things that aren't as deadly, like head lice. It really isn't a reflection of the severity of the disease, but that a lot of people are getting the disease in a lot of places at once.

How concerned should we be?

There are three broad possibilities. First, it could just burn itself out and go away and we'll never see it again. That's the best scenario. The other two scenarios are more likely. This could develop into a full-fledged pandemic, and we'd be off to the races. The third possibility has lots more uncertainty, but may be the most likely, and that is that we don't have too much flu around in the summertime in the northern hemisphere. We don't know where it goes really. But then it comes back again in late summer or early fall. That's sort of what happened in 1918. There was a relatively mild outbreak in the spring, and when it poked its head up again in August, it was a full-fledged monster.

...

Which precautions do you think are worth taking?

Hand and cough hygiene doesn't cost much, and makes people feel better. I don't know how much good it does, but it's reasonable. Then there are the things described as personal responsibility, such as don't go to work if you're sick or don't send your kid to school sick. But if I'm teaching a class and there are two classes left and a final exam and I don't feel well, am I going to abandon the students? It's one thing to say it's my responsibility not to go to work sick, but another thing to understand what it's like on the ground for people.

Pandemic Influenza Preparedness & Response Plan

Big Sandy Community & Technical College Environmental Health & Safety Committeeю
Incorporated as an Appendix To Big Sandy Community &
Technical College Safety Manual & Crisis Management Plan

Big Sandy, Community 8c Technical College, April 2009, p. 2.
https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&ved=2ahUKEwjWt8K7xOr_AhUESmwGHZG-AXA4ChAWegQIDRAB&url=https%3A%2F%2Fbigsandy.kctcs.edu%2Fcurrent-students%2Fmedia%2Fpandemicinfluenzaplan.pdf&usg=AOvVaw3mpzjlB-oAS-o5UgZMZv3i&opi=89978449

Planning Overview

The Office of the President for Kentucky Community and Technical College System (KCTCS) having recognized the potential threat of a world-wide influenza pandemic, and the potential impact it could have on all Kentucky Community and Technical Colleges instructed all locations to develop a plan to respond to the effects such an outbreak would create.

...

This Pandemic Influenza Plan was written specifically for Big Sandy Community and Technical College (BSCTC) by the appointed Crisis Management Team. It is the intent of this plan to identify key important actions BSCTC may need to undertake for the preparation of, and response to an influenza outbreak resulting in business interruption. Continued plan surveillance and updating will be required to ensure that the Pandemic Influenza Plan effectively addresses the unique needs of BSCTC.

Background

According to the World Health Organization (WHO), “An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several simultaneous epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due to the new influenza virus are likely to quickly take hold around the world.”

Influenza is a highly contagious respiratory virus that is responsible for annual epidemics in the United States and other countries. Each year an average of 200,000 people are hospitalized and 36,000 die in the U.S. from influenza infection or a secondary complication. During an influenza pandemic the level of illness and death from influenza will likely increase dramatically worldwide.

The impact of an influenza pandemic on the local economy and business processes could be devastating. It is estimated that 15-35% of the population will be affected. There is a potential for high levels of illness and death, as well as significant disruption to society and our economy, making planning for the next influenza pandemic imperative.

When a pandemic isn't a pandemic

CNN, Health, 4 May 2009; Updated 22:42 GMT (06:42 HKT)
https://edition.cnn.com/2009/HEALTH/05/04/swine.flu.pandemic/index.html

Atlanta, Georgia (CNN) – When the World Health Organization raised its influenza pandemic alert from a Phase 4 to a Phase 5 last week, there was a bit of a gasp heard round the world.

News about the pandemic sent people to line up at a mobile health clinic in Mexico City.

After all, Phase 5 "is a strong signal that a pandemic is imminent," according to WHO.

"All countries should immediately activate their pandemic preparedness plans," the organization's director-general, Dr. Margaret Chan, said Wednesday. "After all, it really is all of humanity that is under threat during a pandemic."

But the word "pandemic" isn't quite as scary as it sounds, explained **David Ozonoff**, professor of environmental health at the Boston University School of Public Health.

"When people hear the words 'pandemic' and 'flu,' the first thing that comes to mind is 1918, which was a real horror show," Ozonoff said, referring to the flu pandemic that killed some 50 million people 91 years ago. But you can have a pandemic without a large number of deaths, he said. "The word pandemic refers to how widely dispersed a disease is, not to how severe the disease is," he said.

Confusion about the meaning of "pandemic" is understandable, Ozonoff said, considering the definition of the word is "not set in stone."

Until Monday morning, the WHO *had a definition* on its Web site saying that a pandemic flu causes "enormous numbers of deaths and illness." After a CNN reporter pointed this out, WHO spokeswoman *Natalie Boudou*[1] called back to say the *definition was in error* and had been pulled from the WHO Web site.

"It was a mistake, and we apologize for the confusion," she said. "(That definition) was put up a while ago and paints a rather bleak picture and could be very scary."

The correct definition is that "pandemic" indicates outbreaks in at least two of the regions into which WHO divides the world, but has nothing to do with the severity of the illnesses or the number of deaths.

Based on lessons from the past, "influenza may cause mild disease in affluent countries, but more severe disease, with higher mortality, in developing countries," Chan said at Wednesday's news conference.

There have been three influenza pandemics in this century, said Andrew Pekosz, associate professor of microbiology and immunology at Johns Hopkins University's Bloomberg School of Public Health. The other two, in 1957 and 1968, also were caused by new viruses to which no one had immunity, but didn't cause nearly the number of deaths as the one in 1918.

"I think people need to be reminded that this current H1N1 outbreak is going to resemble much more the pandemics in 1957 and 1968, where there was an increase in deaths from other years, but nothing like the millions of deaths we saw in 1918," Pekosz said.

[1] Natalie Boudou-Jacobs, Communications Officer, WHO Geneva, email: boudoun@who.int See: https://web.archive.org/web/20130617215844/http://www.who.int/mediacentre/news/notes/2008/np11/es/

ST. CLOUD Times

Learn from brush with swine flu

St. Cloud Times (Saint Cloud, MN), 11 May 2009, Mon, p. 9
https://www.newspapers.com/image/224944553/?terms=%22with%20enormous%20numbers%20of%20deaths%20and%20illness%22&match=1

Pick the basic definition of pandemic:

A. literally one "dem" away from panic!

B. causing enormous numbers of deaths and illness.

C. affecting or tending to affect a disproportionately large number of individuals within a population, community, or region at the same time.

D. occurring over a wide geographic area and affecting an exceptionally high proportion of the population.

OK, first, we're just kidding with 'A."

If you picked "B," it might have been because up until a week ago today, the World Health Organization's definition of pandemic included those exact terms.

If you picked C, well, that's the definition for epidemic.

So the correct answer is D, according to Merriam-Webster's online dictionary.

We bring these terms to your attention because today marks two weeks since the global "swine flu" pandemic began to reach its peak, at least in terms of creating uncertainty, hype and even panic. With the Worst hopefully past, it's 'important to glean a couple of lessons.

Words matter

The first lesson focuses on definitions, especially "pandemic."

A pandemic essentially describes an illness that has spread beyond just one country. The WHO now says its definition indicates outbreaks in at least two of the six regions into which it divides the world, but it is not defined by severity or the number of deaths.

Epidemic means the illness is contained to a smaller region, perhaps a single country or even community. And like pandemic, the word has nothing to with severity of the illness or if it's fatal.

So is this H1N1 bug an influenza pan-demic?

By definition, the answer appears to be yes, although more research will be need-ed to determine if it impacts high enough proportions of the global population.

Still, if H1N1 is a flu pandemic, at this point it remains one far removed from historical proportions.

Health experts generally agree the only three flu pandemics since 1900 occurred in 1918-19, 1957-58 and 1968-69. Their death tolls respectively were estimated at 20 million to 40 million in 1918-19 and from 1 million to 4 million for the other two. As of Friday, WHO reported 1,112 laboratory confirmed human cases of H1N1, including 42 deaths worldwide.

Overhyped? Such numbers allow for another lesson: Keep things in perspective.

Central Minnesota and especially the Cold Spring area experienced firsthand how today's relentless 24/7 media culture can quickly overshadow common sense. From the governor traveling to Cold Spring for a simple news conference to the national airwaves being filled with constant expert analysis, perhaps the most important thing to remember is to avoid media overload.

The future

Please don't think we are trying to close the book on H1N1. History shows that would be foolish. What people should do is learn from these experiences the past few weeks. That starts with knowing "pandemic" is not a synonym for "panic" and that sooner or later we will face similar circumstances again.

nature

Declan Butler

When is a pandemic not a pandemic?

Nature, 21 May 2009, 453(7194): https://doi.org/10.1038/news.2009.501
https://www.nature.com/articles/news.2009.501#citeas

Arguments about the pandemic status of swine flu are a distraction from tackling the outbreak, warns Declan Butler.

As the influenza A (H1N1) swine flu virus fans out across the globe, there can be little doubt that we are already in the early stages of a flu pandemic. Nonetheless, there is considerable resistance to calling it a pandemic.

On 29 April, the World Health Organization (WHO) moved its assessment of the pandemic threat to phase 5 on its six-point scale, indicating that the new virus had caused "sustained community level outbreaks in two or more countries in one WHO region".

And that is where the threat level has sat ever since – one point short of official global pandemic status. The current definition of phase 6 requires that there are "sustained community level outbreaks in at least one other country in a different WHO region". That criterion will almost certainly be met sooner or later.

Level 6 does not mean that we are facing the end of the world. Margaret Chan , WHO ...

Yet this week Margaret Chan, director-general of the WHO, came under pressure from member states – including the United Kingdom and Japan – to move the goalposts to delay or prevent a move to phase 6, by redefining it to include an assessment of the severity of the disease, and not only its geographical spread.

Adding that requirement of severity may sound like common sense. But it is not, because the severity of a pandemic is unpredictable. The flu might fizzle out; or it could go away for months only to come back with a vengeance, creating as much devastation as the 1918 flu outbreak, which caused an estimated 50 to 100 million deaths worldwide.

Moreover, the WHO has pointed out that adding that criterion at a global level would be largely meaningless – what might be deemed a mild disease in a rich country with many doctors, drugs and intensive-care units might be more severe and cause considerable mortality in a poor country with little health infrastructure, and where underlying diseases may worsen outcomes of a flu infection.

So what's the big hang-up with calling a pandemic a pandemic? Those fretting over the term include news pundits in denial about the scale of the threat, along with politicians and scientists who fear that using the word may induce public panic.

Action, not phases

The importance of the phase 6 designation is overrated. It is not some alert threshold that, when passed, triggers an automatic and unstoppable series of draconian measures. As Chan says, "Level 6 does not mean that we are facing the end of the world."

The World Health Organization's Margaret Chan is under pressure over the pandemic status of swine flu. Credit: WHO

The WHO revised its pandemic preparation guidelines in April to make it clear that the organization's role is limited to the following: defining the extent of the virus's spread; coordinating the international public-health response; selecting the pandemic vaccine strains and recommending when large-scale vaccine production should start; and coordinating the gathering of scientific data on the outbreak.

Individual nations then take responsibility for deciding an appropriate course of action. The United States, for example, plans different responses depending on where a pandemic falls on its hurricane-like scale of severity, ranging from category 1 (denoting case-fatality rates of less than 0.1%) to category 5 (denoting case-fatality rates of 2% or above).

Richard Besser, acting head of the US Centers for Disease Control and Prevention (CDC), said in a media briefing on 28 April that from a US perspective, the WHO phases have very little meaning. "What we do means a lot more than what it is called," he told reporters. That involves "looking at what's going on at the community level and adjusting and adapting our guidance and our actions based on what's taking place on the ground". Besser is essentially saying that for practical purposes the US is acting as if it faces a pandemic threat, and other governments should be displaying similar candour.

Indeed, the WHO's expectations of national response are the same for phases 5 and 6. Both call for "each country to implement actions as called for in their national plans", and to be ready for an "imminent response".

Period of grace

Yet the debate over moving to phase 6 goes on. Chan was obliged to meekly acknowledge concerns about moving too quickly to phase 6 in her address on 18 May to the annual meeting in Geneva, Switzerland, of the World Health Assembly – the WHO's supreme decision-making body.

But she reminded delegates that the move to phase 5 had already activated several preparedness measures, and had helped to put public-health services, labs and industry on alert. She reiterated the definition of a pandemic: "A defining characteristic of a pandemic is the almost-universal vulnerability of the world's population to infection. Not all people become infected, but nearly all people are at risk."

The truth is that this defining characteristic has largely been met. As of 21 May, the WHO had reported some 11,034 lab-confirmed cases and 85 deaths in 41 countries. Moreover, although the official tally of lab-confirmed cases in the United States is 5,710, the CDC points out that the true number is probably well over 100,000.

Now that swine flu is everywhere in the United States, the CDC says that counting confirmed cases has become largely irrelevant. It has switched instead to its traditional surveillance systems for monitoring flu-like symptoms by looking for patterns, clusters and changes in flu activity nationwide. Other countries will surely follow suit as their outbreaks progress. Heavy surveillance teamed with rapid isolation and treatment of individual cases only makes sense at the very earliest stage of an outbreak in a region, when there is a possibility of slowing the initial spread. It becomes irrelevant once the virus is spreading widely within the community, as it is in the United States.

As Chan implied in her address, there are more pressing issues at hand than quibbling over phase definitions, such as helping poorer countries to prepare for the pandemic.

"This virus may have given us a grace period, but we do not know how long this will last," says Chan. "I strongly urge the international community to use this grace period wisely. I strongly urge you to look closely at anything and everything we can do, collectively, to protect developing countries from, once again, bearing the brunt of a global contagion."

This morning, Chan told the World Health Assembly that despite pressure to hold off from phase 6, she would not hesitate to raise the level if needs be. Chan is right - it is time to call a pandemic a pandemic.

The New York Times

Lawrence K. Altman

Is This a Pandemic? Define 'Pandemic'

The New York Times, 8 June 2009, p. D1
https://www.nytimes.com/2009/06/09/health/09docs.html

After decades of warnings about the inevitability of another pandemic of influenza, it is astonishing that health officials have failed to make clear to the public, even to many colleagues, what they mean by the word pandemic.

Generations of people have used the term to describe widespread epidemics of influenza, cholera and other diseases. But as the new H1N1 swine influenza virus spreads from continent to continent, it is clear that a useful definition is far more complicated and elusive than officials had thought. And what is at stake is far more than an exercise in semantics. A clear understanding of the term is central to the World Health Organization's six-level staging system for declaring a pandemic, which in turn informs countries when to set their control efforts in motion.

Dictionaries and medical journals offer little guidance. Their definitions can be too vague or too narrow, contradictory and clouded by jargon. "There is a lot of misinformation in the medical literature, and it is really quite hard to figure out what is and what is not a pandemic," said Dr. David M. Morens, an epidemiologist at the National Institute of Allergy and Infectious Diseases who has been studying the history of pandemics. The word implies the rapid spread of an infectious disease to many countries in different regions, hitting each with more or less the same severity. But in fact, severity varies – not all people are infected at the same time, and not every country need be affected.

And there can be many other factors, including the numbers and percentages of people falling ill and dying; a population's vulnerability to the disease, based on previous rates of infection; and the quality of health care facilities and disease monitoring systems. Not least is that scientists do not know precisely how pandemics arise, what fuels them, why they vary in their lethality, why some occur in waves and why they stop.

Health officials have long preached that with influenza, the only sure bet is to expect the unexpected. The new swine influenza virus, which appeared suddenly after years of warning about a potential pandemic of avian influenza, upset the W.H.O.'s assumptions that most people have the same understanding of the word pandemic. For years, the organization's Web site defined an influenza pandemic as causing "enormous numbers of deaths and illness." But the agency recently pulled the definition, apologizing for causing confusion and anxiety.

One of the biggest problems in public health is communicating risk assessment.

United States and W.H.O. officials say their preparedness plans are intended for governments, not people in the street. Officials bristle at criticism that their messages and plans have led the public to equate the word pandemic with the Spanish influenza of 1918-19, the worst recorded pandemic in history, killing 20 million to 100 million people.

In preparing for the worst, officials have considered milder pandemics, said Dr. Nancy J. Cox, chief of the influenza division at the Centers for Disease Control and Prevention in Atlanta. But Dr.

William Schaffner, the chairman of preventive medicine at Vanderbilt University, said that "we, the public health community, deserve to be chided" about the confusion. "We ought to be able to do a better job in communicating in an understandable way," he said in an interview. Scientists like to assert that theirs is an exact discipline. But like the terms "evidence-based medicine" and "peer review," pandemic turns out to be another example of imprecise vocabulary that doctors use every day, assuming everyone understands their meaning.

Journals, textbooks and reference works use pandemic in discussing certain diseases, but rarely define the word. For example, the definition section of the Control of Communicable Diseases Manual, a standard reference work, includes "endemic" (said of a disease that is usually present in an area or a population group) and "epidemic" (more cases of an illness than would normally be expected) but not "pandemic."

The disease manual's editor, Dr. David L. Heymann, a retired assistant director-general of the W.H.O., said the term had not caused confusion in the past, but assured me in an interview that "pandemic will be defined in the next edition."

Even the indexes of most major medical textbooks do not list pandemic. One is Harrison's Principles of Internal Medicine, of which Dr. Anthony S. Fauci, who directs the National Institute of Allergy and Infectious Diseases, is a main editor. "It's a mistake, and I'm surprised it's not there because it should have been," Dr. Fauci said in an interview.

Government agencies do not have official lists of pandemics. Textbooks cite many recent and old ones, including these:

- AIDS. Many experts have called H.I.V. a pandemic. Others disagree, saying the virus is pandemic only in Africa.
- Cholera. Since 1817, most experts agree, the world has had seven pandemics of this bacterial illness, which causes severe diarrhea and dehydration. Acute hemorrhagic conjunctivitis. Beginning in 1969, an enterovirus has caused tens of millions of cases of a highly contagious, acute, painful, but rarely blinding, form of hemorrhagic eye inflammation.
- Dengue. Since World War II, this mosquito-borne viral disease has spread widely in Asia and Latin America.
- Syphilis. A pandemic of the bacterial disease raced through Europe and Asia after Columbus's return from America and during mass movements of armies in Europe.

Although pandemics have been classically limited to infectious diseases, the term has spread to noninfectious, chronic ones. For example, many health officials now speak of pandemics of obesity and heart disease.

Knowledge about past pandemics is necessarily incomplete; historical accounts cannot make up for the absence of modern disease monitoring and laboratory tests. About 14 pandemics of influenza have been described since the 16th century, with the first indisputable one occurring in 1889.

In 1580, an influenza pandemic swept through Asia into Europe within six weeks, and at least 10 percent of Rome's 81,000 residents died in the first week, said Dr. Michael T. Osterholm, director of the Center for Infectious Disease Research and Policy at the University of Minnesota. Some Spanish cities were almost totally depopulated.

Dr. Morens, of the infectious diseases institute, said his studies of influenza pandemics left a confusing track record and "are rewiring our brains about thinking about influenza." "The medical literature will tell you there were three pandemics in the 1830s," he said – "one from 1830 to 1832, a second in 1833 to 1834 and a third in 1836 to 1837. But I am beginning to think they were all one pandemic."

Dr. Morens said he was puzzled as to why no influenza pandemics were recorded for nearly 150 years after the one in 1580, although there were some severe localized epidemics. "A period of

pandemic stability makes us wonder whether a pandemic comes at any time by chance," he said, "or whether something about epidemic situations prevents pandemics," or at least delays them.

The W.H.O.'s staging system has long been part of its plan for an influenza pandemic.

Deep concern about a potential pandemic of the H5N1 avian influenza virus led the organization to convene a large meeting of experts in 2005. Among other things, the experts recommended simplifying the staging system.

A number of doctors ask why health agencies do not declare seasonal influenza a pandemic when it spreads around the world.

But Dr. Osterholm, the Minnesota expert, said that "you can't use the terminology for just worldwide transmission, because if you did that, you would say every seasonal flu year is a pandemic." "To me," he continued, "a pandemic is basically a new or novel agent emerging with worldwide transmission."

Dr. Keiji Fukuda, an influenza expert who is an assistant director-general at the W.H.O., said in an interview that "as difficult as things are right now," the problem of defining a pandemic and communicating risk "would be magnitudes worse and more confusing" if the agency had not dealt with AIDS, SARS and avian influenza.

Those experiences prompted new international health regulations and pandemic plans, and allowed critical scientific information to be disseminated quickly, he said.

The process was "painful, sure," he said. "But you can't really do anything like this without having some amount of pain."

Los Angeles Times

Michael Fumento

WHO's flu

Los Angeles Times, 14 June 2009, 12 AM // 9, p. 21.
https://www.latimes.com/archives/la-xpm-2009-jun-14-oe-fumento14-story.html

How bizarre! The World Health Organization has declared swine flu a "pandemic," signaling governments worldwide to launch emergency response plans.

The mildest pandemics of the 20th century killed at least a million people worldwide, according to the WHO's data, while old-fashioned seasonal flu strikes every nation yearly and kills an estimated 250,000 to 500,000. As of Thursday, when the pandemic was declared, H1N1 swine flu had killed only 144 people total – fewer than succumb daily to seasonal flu annually. And in Mexico, where the outbreak began and where it has been the most severe, cases peaked quickly, in just four weeks.

A pandemic declaration will be costly when we can least afford it and could prompt severe restrictions on human activities (think China). Perhaps most important, such a declaration could render the term "flu pandemic" essentially meaningless – risking lethal public complacency if a bona fide one hits.

So how can the WHO say swine flu qualifies as a pandemic? And why?

The WHO definition for "influenza pandemic" once required "several, simultaneous epidemics worldwide with enormous numbers of deaths and illness." But in 2005, it promulgated a definition that virtually ignores the number of cases and completely ignores deaths. Now it requires "sustained chains of human-to-human transmission leading to community-wide outbreaks" in two parts of the world, with this addition: The cause must be an animal or human-animal flu virus; the latter is known as genetic reassortment.

Thus, under this definition, "community-wide outbreaks" of swine flu in two South American countries and somewhere in China could qualify as a pandemic. No deaths required. And a pure human flu that killed 20 million people would not qualify.

The obvious presumption is that viruses with animal genes pose a greater threat. But that's "a matter of faith more than science," says James Chin, a UC Berkeley epidemiologist who was in charge of surveillance and control of communicable diseases at the WHO in the late 1980s.

Indeed, the science indicates the presumption is false. The WHO first warned of an H5N1 avian flu pandemic in 2004, projecting up to 150 million deaths. Yet a 2007 study found H5N1 – though detected in 1959 – was many mutations away from the ability to become readily transmissible among humans.

We're also repeatedly warned that if H5N1 reassorted with human flu, it would produce a combination with the alleged severity of the bird virus and the infectiousness of the human one. Yet a 2006 Centers for Disease Control and Prevention study found the opposite: that a genetically engineered reassortment given to ferrets – the best animal models for human flu – produced milder and less infectious flu than did pure H5N1. Reassortment didn't create a "super flu" but rather a 98-pound weakling.

As to human-pig hybrids, a 1976 New Jersey swine flu outbreak in the dead of winter, when flu is most contagious, infected just 230 soldiers, killing one, on a crowded Army base.

At some level, the WHO knows its definition is faulty. The online "WHO Handbook for Journalists" still states: "A pandemic virus can emerge" by adapting "during human infections." And the WHO has warned that one way avian flu could become pandemic is through a purely human mutation.

But it's also true that the worst influenza pandemic in history, the Spanish flu of 1918-19, did involve an animal-human hybrid virus; that episode has become a popular obsession. Never mind that "each subsequent novel flu that sweeps through the world has been milder," Chin observes. "The public health community keeps waiting for the second coming" of Spanish flu, he says.

So, in 2005, the WHO apparently redefined "flu pandemic" to reflect the popular angst as well as its own.

A less generous observation is that the WHO's "when, not if" avian flu pandemic failed to materialize, and it has now put swine flu in its stead. In her pandemic announcement Thursday, WHO's director-general, Margaret Chan, declared: "The world can now reap the benefits of investments over the last five years in pandemic preparedness." Not really. Swine flu, being no more contagious and far milder than seasonal flu, calls for absolutely no actions that wouldn't apply to seasonal varieties.

"I think they're going to have to go back to the drawing board," says Chin of the WHO definition. For now, we'll pay in told and untold ways because the WHO has cried "havoc" and let slip the dogs of pandemic.

How bizarre. The World Health Organization has declared swine flu a "pandemic," signaling governments worldwide to launch emergency response plans.

The mildest pandemics of the 20th century killed at least a million people, according to the WHO's data, while old-fash-ioned flu strikes every nation yearly and kills an estimated 250,000 to 500,000. As of Thursday, when the pandemic was declared, fi1N1 swine flu had killed 144 people total.

A pandemic declaration will be costly when we can least afford it and could prompt severe restrictions on human activities (think China).

The WHO definition for "influenza pandemic" once required "several, simultaneous epidemics with enormous numbers of deaths and illness." But in 2005, it promulgated a definition that virtually ignores the number of cases and completely ignores deaths. Now it requires "sustained chains of human-to-human transmission leading to com-munity-wide outbreaks" in two parts of the world, with this addition: The cause must be an animal or human-animal flu virus; the latter is known as genetic reassortment.

Under this definition, "community-wide outbreaks" of swine flu in two South American countries and somewhere in China could qualify. No deaths required. And a pure hu-man flu that killed 20 million people would not qualify.

General Information

H1N1 Flu Virus has been reported around the world, and the World Health Organization (WHO) has declared it a pandemic influenza virus.

Governments around the world and the World Health Organization are engaged to investigate and address this situation.

The Public Health Agency of Canada continues to work with federal, provincial and international governments to address this situation, and will share more information with Canadians as it becomes available.

...

International Actions

Q1. The World Health Organization (WHO) has raised the pandemic alert level to Phase Six. What are these phases?

WHO currently identifies six stages of Pandemic Preparedness and Response.

Phase 1: Influenza viruses are circulating in animals, especially birds. No reports of animal viruses infecting humans.

Phase 2: Human infection by an animal influenza virus. Potential pandemic threat.

Phase 3: An animal or animal-human influenza virus has caused limited disease in people. Isolated human to human transmission may occur – but not widespread.

Phase 4: Verified human to human transmission of an animal or human-animal virus causing widespread or "community-level" outbreaks. Risk of pandemic is considered much higher but not a foregone conclusion.

Phase 5: Human to human spread of the virus is confirmed in at least two countries in one WHO region. It is likely that a pandemic is imminent. Time to finalize organization, communication, and implementation of planned mitigation strategies is short.

Phase 6: The Pandemic Phase. Community outbreaks in at least one country from a second WHO region – indicating that a global pandemic is underway. The Director-General of the WHO makes the decision about an elevation of pandemic phases based on reports from countries of the impact of disease.

...

Q4. Are all pandemics severe?

No. An influenza pandemic may be mild, moderate or severe. An influenza pandemic means the virus is spread easily between humans, and affects a wide geographic area. An influenza pandemic does not necessarily cause more severe illness than seasonal influenza. (p. 13)

Q4. Are all pandemics severe?

No. An influenza pandemic may be mild, moderate or severe. An influenza pandemic means the virus is spread easily between humans, and affects a wide geographic area. An influenza pandemic does not necessarily cause more severe illness than seasonal influenza.

Profile

Neue Grippe: Was ist eine Pandemie?
Kurz bevor die WHO die höchste Pandemie-Warnstufe ausrief,
änderte sie deren Definition.

NEUE GRIPPE

Was ist eine Pandemie?

Kurz bevor die WHO die höchste Pandemie-Warnstufe ausrief, änderte sie deren Definition.

Bis Anfang Mai dieses Jahres fand sich auf der Website der Weltgesundheitsorganisation (WHO) die Erklärung, dass sich eine Influenza-Pandemie durch eine „enorme Anzahl von Todesfällen und Krankheiten" auszeichnet. Als WHO-Generaldirektorin Margaret Chan dann am 11. Juni die höchste Pandemie-Warnstufe ausrief, war dieser Passus bereits gestrichen worden. Chan begründete die Maßnahme nur noch mit der geografischen Bedeutung des Wortes: Eine Pandemie ist demnach eine Infektionskrankheit, die sich über eine große Region ausbreitet. Damit erst passte die neue H1N1-Influenza ins Schema, da sie bislang eher die Charakteristiken einer milden Grippewelle aufweist.

Die rein geografische Argumentation stößt aber auf Kritik. „Wenn das so ist, dann müsste man jedes Jahr bei der ganz normalen Influenza auch die Pandemie ausrufen", erklärte Michael Osterholm, Infektionsexperte der Universität Minnesota. Und Tom Jefferson, Influenza-Experte der unabhängigen Cochrane Collaboration, tippte auf finanzielle Hintergründe der WHO-Aktion. „Um die Pandemie ist im Lauf der Jahre eine richtige Geldmaschine aufgebaut worden, und diese wurde nun in Gang gesetzt."

Auf Nachfrage bei der WHO entschuldigte sich deren Sprecherin Natalie Boudou für die mit der Definitionsänderung ausgelöste Konfusion. „Das wurde bereits vor längerer Zeit veröffentlicht und könnte die Menschen verängstigen." Die WHO wolle aber nur zur Wachsamkeit aufrufen.

2. Background: What is a pandemic?

Influenza pandemics are usually associated with *high morbidity, excess mortality* as well as economic and social disruptions. As defined by the World Health Organization (WHO), influenza pandemics arise when:

1. A "novel" influenza virus, to which the general population has no pre-existing immunological protection, emerge.[2]
2. The virus infects humans and causes serious illness.
3. It spreads efficiently amongst people with sustained chains of transmission.

Once such an event starts and reaches a certain level of local or regional spread, continued worldwide spread of the virus is considered inevitable especially given the highly interconnected nature of today's world.

2. Background: What is a pandemic?

Influenza pandemics are usually associated with high morbidity, excess mortality as well as economic and social disruptions. As defined by the World Health Organization (WHO), influenza pandemics arise when:

Peter Doshi

Calibrated response to emerging infections

BMJ, 3 September 2009; 9; 339(sep 03 2):b3471-b3471.
http://www.bmj.com/cgi/content/full/339/sep03_2/b3471

WHO has revised its definition of pandemic flu in response to current experience with A/H1N1. Peter Doshi argues that our plans for pandemics need to take into account more than the worst case scenarios.

The current flu pandemic raises a public health policy question that could have been asked after the emergence of severe acute respiratory syndrome (SARS): what is the proper response to clinically mild or epidemiologically limited (small number) outbreaks caused by new viruses? Over the past four years, pandemic preparations have focused on responding to worst case scenarios. As a result, officials responded to the H1N1 outbreak as an unfolding disaster. Measures were taken that in hindsight may be seen as alarmist, overly restrictive, or even unjustified. Assumptions about the nature of emerging infections along with advanced laboratory surveillance have changed the way we understand epidemics and we need a new framework for thinking about epidemic disease.

Predictions that missed the mark

Before the arrival of novel A/H1N1 virus, pandemics were said to occur when a new subtype of influenza virus to which humans have no immunity enters the population, begins spreading widely, and causes severe illness.[1, 2] Reference was often made to the catastrophic pandemic of 1918 and the ongoing threat of highly pathogenic avian influenza H5N1 that has killed over half of the 456 people with recorded infection since 1997. Without proper preparation, "The loss of human life even in a mild pandemic will be devastating, and the cost of a world economy in shambles for several years can only be imagined," one highly cited article concluded in 2005.[3] The large sums of public money spent on pandemic preparedness (over $7bn (£4bn; €5bn) in the US) underlined the seriousness of the threat, and often repeated phrases such as "not a question of IF a pandemic will happen, but WHEN"[4] characterised the next flu pandemic as a high probability, high consequence event.

But the 2009 pandemic, taken as a whole, bears little resemblance to the forecasted pandemic. Pandemic A/H1N1 virus is not a new subtype but the same subtype as seasonal A/H1N1 that has been circulating since 1977. Furthermore, a substantial portion of the population may have immunity. The US Centers for Disease Control and Prevention (CDC) found that 33% of those aged over 60 had cross reactive antibody to novel A/H1N1,[5] which may explain why cases have been rare in elderly people.

There is also far less certainty today regarding the severity of the threat of pandemic flu. Experts are unsure that the 2009 pandemic – which the World Health Organization presently characterises as moderate[6] – will be any worse than seasonal flu.[7,8,9] Since the emergence of novel A/H1N1, descriptions of pandemic flu (both its causes and its effect) have changed to such a degree that the difference between seasonal flu and pandemic flu is now unclear (table ⇓).[10] WHO, for example, for years defined pandemics as outbreaks causing "enormous numbers of deaths and illness",[10] but in early May, removed this phrase from the definition.[11]

Changing views of pandemic flu, before and after emergence of influenza A/H1N1 virus

Aspect	Before A/H1N1	Since A/H1N1
One line summary	WHO 2003-9: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness".[10]	WHO: "An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity".[10]
Virus and immunity	WHO 2005:"Most people will have no immunity to the pandemic virus".[1]	WHO: "The vulnerability of a population to a pandemic virus is related in part to the level of pre-existing immunity to the virus".[12]
	US CDC 1997: "When antigenic shift occurs, the population does not have antibody protection against the virus"[13]	US CDC: "Cross-reactive antibody [to A/H1N1] was detected in 6%-9% of those aged 18-64 years and in 33% of those aged >60 years".[5]
Impact (health, social, economic)	WHO 2005: "Large numbers of deaths will occur . . . WHO has used a relatively conservative estimate—from 2 million to 7.4 million deaths . . . Economic and social disruption will be great"[1]	WHO: "H5N1 has conditioned the public to equate an influenza pandemic with very severe disease and high mortality. Such a disease pattern is by no means inevitable during a pandemic. On the contrary, it is exceptional".[14]
	CDC 1997: "The hallmark of pandemic influenza is excess mortality"[13]	CDC: "There are some pandemics that look very much like a bad flu season"[8]
	Canada 2006: "An influenza pandemic results if many people around the world become ill and die from such a [new form of influenza] virus"[15]	Canada: "An influenza pandemic does not necessarily cause more severe illness than seasonal influenza"[9]

On 29 April 2009, one week after news of the outbreak first surfaced, WHO declared a phase 5 pandemic alert (the highest threat level short of global pandemic), urging all countries to "immediately activate their pandemic preparedness plans".[16] Epidemiological information at this time was mixed, suggesting a severe disease in Mexico but mild everywhere else. Actions were thus taken in an environment of high public attention and low scientific certainty.[17,18] Some countries erected port of entry quarantines. Others advised against non-essential travel to affected areas. Some closed schools and businesses. Many held daily press briefings. The wisdom of many of these actions, particularly in response to what has largely been a clinically mild illness, will undoubtedly be debated in the future. What these actions more clearly show, however, is that the public health response to, as well as impact and social experience of a pandemic, is heavily influenced by longstanding planning assumptions about the nature of pandemics as disaster scenarios.

Forbes

Michael Fumento

The Pandemic Is Political

Forbes, 16 October 2009, 7:15 pm EDT
https://www.forbes.com/2009/10/16/swine-flu-world-health-organization-pandemic-opinions-contributors-michael-fumento.html?sh=474767ae6899

As evidence continues to mount that swine flu is more of a piglet than a raging razorback, why isn't curiosity mounting as to why the World Health Organization declared it a pandemic? And definitions aside, why does the agency continue to insist we're going to get hammered? The answers have far less to do with world health than with redistribution of world wealth.

Medically, the pandemic moniker is unjustifiable. When the sacrosanct World Health Organization (WHO) made its official declaration in June, we were 11 weeks into the outbreak, and swine flu had only killed 144 people worldwide--the same number who die of seasonal flu worldwide every few hours. The mildest pandemics of the 20th century killed at least a million people worldwide. And even after six months, swine flu has killed about as many people as the seasonal flu does every six days.

So how could WHO make such an outrageous claim? Simple. It rewrote the definition of "pandemic."

A previous official definition (and widely used unofficial one) required "simultaneous epidemics worldwide with enormous numbers of deaths and illness." Severity – that is, the number – is crucial, because seasonal flu *always* causes worldwide simultaneous epidemics. But one promulgated in April just days before the announcement of the swine flu outbreak simply eliminated severity as a factor.

That's also how we can have a "pandemic" when six months of epidemiological data show swine flu to be far milder than the seasonal variety. New York City statistics show it to be perhaps a 10th as lethal. In Australia and New Zealand, flu season has ended, and almost all cases have been swine flu. Yet even without a vaccine, these countries are reporting fewer flu deaths than normal. (In New Zealand, that's just 18 confirmed deaths compared with 400 normally.) Swine flu is causing negative deaths! The best explanation is that infection with the milder strain (swine flu) is inoculating against the more severe strain (seasonal flu) it has displaced.

This all makes sense once you realize that swine flu isn't some sort of alien from outer space as we've been led to believe, but rather "the same subtype as seasonal A/H1N1 that has been circulating since 1977," as the BMJ (formerly the British Medical Journal) observes. It's "something our immune systems have seen before," echoes Peter Palese of New York's Mount Sinai School of Medicine.

The older you are, the more you've been exposed and the higher your immunity level – hence the need to give two swine flu vaccinations to those under age 10.

Nevertheless, because WHO dubbed this a "pandemic," vaccination plans, emergency response measures and frightening predictions have been based on comparisons with true pandemics that by definition were especially severe. That includes the August report from the President's Council of Advisors on Science and Technology with its "plausible scenario" of "30,000 - 90,000 deaths" peaking in "mid-October."

Check your calendar. So, then, why did WHO do it?

Пандемия политическая

3rm.info / Forbes, 9 ноября 2009
перевод с английского
Fumento M. The Pandemic Is Political. – Forbes, 16 October 2009.
https://3rm.info/main/622-forbes-pandemiya-politicheskaya.html

По мере появления доказательств того, что свиной грипп скорее Пятачок, чем клыкастый монстр, хочется поинтересоваться: зачем Всемирная организация здравоохранения объявила пандемию? Почему продолжает настаивать на том, что нам крышка? Ответы, к сожалению, имеют значительно меньше общего с миром здравоохранения, нежели с перераспределением мировых капиталов. С точки зрения медицины пандемии сейчас нет. Когда в июне Всемирная организация здравоохранения (ВОЗ) официально объявила пандемию, прошло 11 недель с начала вспышки, а свиной грипп убил 144 человека.

Именно столько человек умирает от сезонного гриппа во всем мире каждые несколько часов. При наиболее легких пандемиях XX столетия погибли как минимум миллион человек. И даже через 6 месяцев свиной грипп убил приблизительно столько же людей, сколько сезонный грипп уничтожает за каждые шесть дней.

Как тогда ВОЗ могла сделать такое возмутительное заявление? А просто. Она переписала определение «пандемии». Предыдущее официальное определение (широко распространенное неофициально) предполагало «одновременную эпидемию по всему миру с огромным количеством смертей и болезней».

Серьезность – то есть, цифры – важна, поскольку сезонный грипп всегда вызывает во всем мире одновременные эпидемии. Но из определения, обнародованного в апреле за несколько дней до объявления про вспышку свиного гриппа, просто вычеркнута серьезность как фактор. Именно потому мы можем иметь «пандемию», когда эпидемиологические данные за 6 месяцев показывают, что свиной грипп будет гораздо мягче, чем сезонный штамм.

Статистические данные из Нью-Йорка показывают, что его показатель смертность может составлять - 10. В Австралии и Новой Зеландии сезон гриппа завершился, и почти во всех случаях диагнозом был свиной грипп. Но даже без вакцинирования эти страны сообщают про меньшее количество смертей, чем обычно. (В Новой Зеландии подтверждено 18 случаев смерти по сравнению с обычными 400).

Тем не менее, поскольку ВОЗ объявила «пандемию», планы вакцинации, меры реагирования на чрезвычайные ситуации и запугивания отталкиваются от сравнения с настоящими пандемиями, которые были особо тяжелыми по определению. К ним принадлежит и августовский доклад Совета по вопросам науки и техники Президента США с ее «вероятным сценарием» с «30000 – 90000 смертей» и пиком в «середине октября».

Но на календаре уже ноябрь... Так зачем ВОЗ это делает?

WHO pandemic definition too broad, doctor contends

Infectious disease specialist suggests in article that World Health Organization's loose definition could lead to false alarms

Globe and Mail, 2 November 2009, 10:39AM EST
https://web.archive.org/web/20091106131943/http://www.theglobeandmail.com/life/health/h1n1-swine-flu/who-pandemic-definition-too-broad-doctor-contends/article1348100/

The World Health Organization's definition of what constitutes a pandemic is too broad, according to an article published this week.

Peter Gross, infectious disease specialist with the Hackensack University Medical Center in New Jersey, has penned an editorial for the British Medical Journal's Clinical Evidence in which he suggests that the WHO's loose definition could lead to false alarms.

The WHO changed their definition last year, Dr. Gross said. Previously, a “shift” in the virus would have to occur, meaning a new subtype of the virus would have to appear in order for a pandemic to be declared.

A subtype is represented in the H and N numbers of a flu virus' name, such as H1N1. Another example is avian flu, which is categorized as H5N1 or, technically, as Influenza A/H5N1.

Now, with their recent change, Dr. Gross said the WHO has made the definition too vague. “They said a new animal or human-animal strain could qualify as a pandemic strain. That's too non-specific.” He said neither shifts nor drifts, which are subtle changes in the virus' makeup, are mentioned specifically in the guidelines for declaring a pandemic.

As of this year, the WHO defines a pandemic as occurring “when an animal influenza virus to which most humans have no immunity acquires the ability to cause sustained chains of human-to-human transmission leading to community-wide outbreaks. Such a virus has the potential to spread worldwide, causing a pandemic.”

Dr. Gross says the new definition could lead to false alarms and that “any minor change, any minor drift could be considered a pandemic.”

He also pointed out that, even in a medical dictionary, the definitions for the terms “pandemic” and “epidemic” are not clear, with no guidelines set on the number of people who need to be affected to reach either status, and no specific mortality rate.

In their 2009 Pandemic Influenza Preparedness and Response document, the WHO defined a pandemic as simply “an epidemic on a global scale.”

Dr. Gross said, “H1N1 has been around for most of this century, except for 20 years mid-century, from 1957 to 1976. Nobody knows where it went, but then it re-appeared in '76.”

He said that since 1977, H1N1 has been included in seasonal flu vaccines, along with H3N2.

However, Dr. Gross said the current strain of H1N1 has undergone a significant drift in its makeup, thereby making humans less resistant to it.

“A seasonal flu causes about 36,000 deaths,” he said, referring to statistics in the United States. “The difference with what's going on right now is we have more morbidity and mortality among young children and young adults. Usually, it's the other end of the age-spectrum that's affected.”

The WHO pandemic document includes statistics for the three major pandemics of the 20th century. The worst was the Spanish Flu of 1918-1919, which also targeted young adults and killed 2 to 3 per cent of those who contracted it, worldwide.

“Influenza is different from most other human viruses,” he said. “When you get the measles vaccine, that lasts for a lifetime because the virus is genetically stable.” Influenza, on the other hand, is not as stable because its genetic makeup is split into pieces. If one strain meets another, the pieces mix together. “When it comes out, who knows what it's going to look like?”

“We just need a better definition of all of this,” Dr. Gross said. “It's really kind of amazing after all these years that it's not clearer.”

Mystisk ændring af WHO's definition af en pandemi

Information, 16. november 2009
https://www.information.dk/udland/2009/11/mystisk-aendring-whos-definition-pandemi?lst_cntrb

WHO har pludselig ændret definitionen på en pandemi på sin hjemmeside. Nu kan stort alle influenzaer kaldes for pandemier, mener kritikere. Dermed vil medicinalindustrien også fremover kunne tjene milliarder på vaccine til relativt ufarlige sygdomme

På WHO's hjemmeside er definitionen af en pandemi blevet ændret. I maj var det et krav, at en influenza skulle forsage et 'enormt antal af døde eller syge', før den kunne betegnes som en pandemi. Men det er ikke længere en del af definitionen. I dag er disse linjerne klippet ud, og det er betænkeligt, mener flere forskere:

»WHO forudsagde svineinfluenza i 2005, men det var først, da de ændrede definitionen for en pandemi i 2009, at de fik ret,« siger epidemiolog Tom Jefferson, der har arbejdet i Rom for det uafhængige forskningsinstitut, Cochrane, i 15 år.

Han finder det mærkværdigt, at netop de linjer er klippet ud, fordi svineinfluenzaen foreløbig kun har kostet 6.071 mennesker livet i modsætning til den almindelige influenza, der ifølge WHO hvert år koster op mod 500.000 mennesker livet.

»Vi er nødt til at vide, hvorfor definitionen blev ændret? Hvem, der ændrede den og hvornår? Efter min mening bør det hele undersøges af et uafhængigt værn,« siger Tom Jefferson.

Forsker på Massachusetts Institute of Technology (MIT) Peter Doshi, kritiserede for nylig definitionsændringen i en analyse i det britiske lægetidsskrift, British Medical Journal:

»Siden H1N1 opstod har beskrivelsen af årsager og konsekvenser ved en pandemi ændret sig i et omfang, hvor forskellen mellem almindelig influenza og pandemisk influenza er usikker«, lyder hans kritik.

Skal følge WHO

Tidligere speciallæge i arbejds- og samfundsmedicin på bl.a. Aarhus Universitet, Mauri Johansson, er enig:

»Begrebet er udvandet. Rigtig mange influenzaer vil fremover kunne betages som pandemier, og beslutningen ligger alene hos WHO,« siger Mauri Johansson, og peger på konsekvenserne:

»Alle medlemslande er forpligtede til at følge anbefalingerne fra WHO - i Danmark er vi tilmed forpligtet til at købe vacciner imod influenzaen, fordi vi lige som mange andre lande har lavet en kontrakt med en virksomhed, og den bliver udløst, hvis WHO erklærer pandemi.«

Information beskriver i dag, hvordan flere af WHO's eksperter er betalt af medicinalindustrien - og hvordan beslutningen om at gøre H1N1 til en pandemi har udløst vaccineordrer hos medicinalindustrien for op imod 55 milliarder kroner.

Den nye definition bør føre til en ændring i beredskabet, mener Peter Doshi: »Jeg mener ikke, at det giver nogen mening at have et pandemiberedskab, der er designet til en nødsituation, hvis den sygdom, der udløser nødberedskabet, ikke er mere alvorlig end det gennemsnitligt årlige sygdomsniveau. At kalde noget for en pandemi afføder alvorlige reaktioner i det offentlige sundhedsvæsen, som igen får alvorlige sociale, politiske og økonomisk konsekvenser,« siger Peter Doshi.

Forskningsleder Peter A Gross fra Hackensack University Medical Center er enig i, at WHO's ændrede definition er problematisk:

»I fremtiden ville det klæde WHO at være klarere i deres definition af en influenzapandemi. Det er uklart, om dødeligheden vil stige som følge af H1N1, men uanset hvad vil det stresse sundhedssystemet,« påpeger Peter A. Gross.

WHO

Hos WHO mener talsmand for H1N1's globale alarmberedskab, Gregory Härtl ikke, at der er problemer med definitionen af en epidemi:

- Hvorfor er 'enormt antal af døde og syge' ikke længere en del af WHO's definition på en pandemi?

»Den formulering har brugt siden 2004, hvor den blev lagt på en hjemmeside. Men den har aldrig været den officielle definition. Der skal man i stedet se på The Pandemic Preparedness Guidance«.

- Definitionen står på WHO's hjemmeside under overskriften: Hvad er en influenzapandemi? Men det er ikke en definition?

»Jeg ved godt, at man skulle tro, at hjemmesiden er officiel, men det er den altså ikke. Sætningen 'enorme antal af døde og syge til følge' har aldrig været i The Pandemic Preparedness Guidance«.

Det har ikke været muligt at finde ud af præcis, hvornår ændringen af definitionen på WHO's hjemmeside blev gennemført.

A mystisk change in the WHO's definition of a pandemic

Google translation from Dutch into English

Information, 16 November 2009
https://www.information.dk/udland/2009/11/mystisk-aendring-whos-definition-pandemi?lst_cntrb

The WHO has suddenly changed the definition of a pandemic on its website. Now almost all influenzas can be called pandemics, say critics. In this way, the pharmaceutical industry will continue to be able to earn billions from vaccines for relatively harmless diseases

On the WHO website, the definition of a pandemic has been changed. In May, it was a requirement that a flu had to cause an 'enormous number of dead or sick' before it could be described as a pandemic. But that is no longer part of the definition. Today, these lines have been cut out, and this is worrisome, according to several researchers:

"The WHO predicted swine flu in 2005, but it wasn't until they changed the definition for a pandemic in 2009 that they got it right," says epidemiologist Tom Jefferson, who has worked in Rome for the independent research institute, Cochrane, for 15 years.

He finds it strange that precisely those lines have been cut out, because the swine flu has so far only claimed the lives of 6,071 people, in contrast to the common flu, which, according to the WHO, kills up to 500,000 people every year.

“We need to know why the definition was changed? Who changed it and when? In my opinion, the whole thing should be investigated by an independent body,' says Tom Jefferson.

Massachusetts Institute of Technology (MIT) researcher Peter Doshi recently criticized the definition change in an analysis in the British Medical Journal:

"Since H1N1 emerged, the description of the causes and consequences of a pandemic has changed to an extent where the difference between ordinary flu and pandemic flu is uncertain," reads his criticism.

Must follow WHO

Former specialist in occupational and social medicine at, among others Aarhus University, Mauri Johansson, agrees:

"The concept is watered down. A great many influenzas will in future be considered pandemics, and the decision rests with the WHO alone,' says Mauri Johansson, and points to the consequences:

"All member states are obliged to follow the recommendations from the WHO - in Denmark we are also obliged to buy vaccines against the flu because, like many other countries, we have made a contract with a company, and it is triggered if the WHO declares a pandemic."

Information today describes how several of the WHO's experts have been paid by the pharmaceutical industry - and how the decision to make H1N1 a pandemic has triggered vaccine orders from the pharmaceutical industry for up to DKK 55 billion.

The new definition should lead to a change in preparedness, Peter Doshi believes: "I don't think it makes sense to have a pandemic preparedness designed for an emergency if the disease that triggers the emergency is not more serious than the average annual level of disease. Calling something a pandemic generates serious reactions in the public health system, which in turn have serious social, political and economic consequences,' says Peter Doshi.

Research leader Peter A Gross from Hackensack University Medical Center agrees that the WHO's changed definition is problematic:

"In the future, it would behoove the WHO to be clearer in their definition of an influenza pandemic. It is unclear whether mortality will increase as a result of H1N1, but regardless, it will stress the health system,' points out Peter A. Gross.

WHO

At the WHO, spokesman for H1N1's global emergency preparedness, Gregory Härtl does not believe that there are problems with the definition of an epidemic:

- Why is 'huge number of dead and sick' no longer part of the WHO's definition of a pandemic?

"That wording has been used since 2004, when it was put on a website. But it has never been the official definition. Instead, you should look at The Pandemic Preparedness Guidance'.

- The definition is on the WHO website under the heading: What is an influenza pandemic? But that's not a definition?

"I know that you would think that the website is official, but it is not. The phrase 'enormous number of dead and sick as a result' has never been in The Pandemic Preparedness Guidance'.

It has not been possible to find out exactly when the change to the definition on the WHO website was implemented.

Загадочное изменение в определении пандемии проведенное ВОЗ

Google перевод с голландского на русский

Information, 16 ноября 2009
https://www.information.dk/udland/2009/11/mystisk-aendring-whos-definition-pandemi?lst_cntrb

ВОЗ неожиданно изменила определение пандемии на своем сайте. Сейчас почти все виды гриппа можно назвать пандемиями, говорят критики. Таким образом, фармацевтическая промышленность по-прежнему сможет зарабатывать миллиарды на вакцинах от относительно безвредных болезней.

На сайте ВОЗ изменено определение пандемии. В мае требовалось, чтобы грипп вызвал «огромное количество умерших или заболевших», прежде чем его можно было назвать пандемией. Но это больше не является частью определения. Сегодня эти строчки были вырезаны, и это вызывает беспокойство, по мнению нескольких исследователей:

«ВОЗ предсказала свиной грипп в 2005 году, но только когда они изменили определение пандемии в 2009 году, они поняли это правильно», — говорит эпидемиолог Том Джефферсон, который работал в Риме в независимом исследовательском институте Cochrane, 15 лет.

Ему кажется странным, что вырезаны именно эти строки, потому что свиной грипп унес пока только 6071 жизнь, в отличие от обычного гриппа, который, по данным ВОЗ, ежегодно уносит жизни до 500 000 человек.

«Нам нужно знать, почему определение было изменено? Кто изменил его и когда? На мой взгляд, все это должно быть расследовано независимым органом», — говорит Том Джефферсон.

Исследователь из Массачусетского технологического института (MIT) Питер Доши недавно раскритиковал изменение определения в анализе, опубликованном в British Medical Journal:

«С момента появления H1N1 описание причин и последствий пандемии изменилось до такой степени, что разница между обычным гриппом и пандемическим гриппом неопределенна», — говорится в его критике.

Дания обязана следовать решениям ВОЗ

Бывший специалист по профессиональной и социальной медицине, в том числе Орхусский университет, Маури Йоханссон, соглашается:

«Концепция размыта. Многие виды гриппа в будущем будут считаться пандемиями, и решение остается за ВОЗ», — говорит Маури Йоханссон и указывает на последствия:

«Все государства-члены обязаны следовать рекомендациям ВОЗ – в Дании мы также обязаны покупать вакцины против гриппа, потому что, как и во многих других странах, мы заключили контракт с компанией, и он срабатывает, если ВОЗ объявляет пандемия».

Сегодняшняя информация описывает, как фармацевтическая промышленность заплатила нескольким экспертам ВОЗ, и как решение сделать H1N1 пандемией привело к тому, что фармацевтическая промышленность заказала вакцины на сумму до 55 миллиардов датских крон.

Новое определение должно привести к изменению готовности, считает Питер Доши: «Я не думаю, что имеет смысл иметь готовность к пандемии, предназначенную для чрезвычайной ситуации, если болезнь, вызвавшая чрезвычайную ситуацию, не более серьезна, чем среднегодовой уровень заболеваемости. болезнь. Называние чего-то пандемией вызывает серьезную реакцию в системе общественного здравоохранения, что, в свою очередь, имеет серьезные социальные, политические и экономические последствия», – говорит Питер Доши.

Руководитель исследования Питер А. Гросс из Медицинского центра Университета Хакенсак согласен с тем, что измененное определение ВОЗ проблематично:

«В будущем ВОЗ надлежит быть более четким в своем определении пандемии гриппа. Не ясно, увеличится ли уровень смертности в результате H1N1, но, тем не менее, это вызовет нагрузку на систему здравоохранения», — отмечает Питер А. Гросс.

ВОЗ

Представитель ВОЗ по вопросам глобальной готовности к чрезвычайным ситуациям в связи с H1N1 Грегори Хартль не считает, что существуют проблемы с определением эпидемии:

- Почему «огромное количество умерших и больных» больше не входит в определение пандемии ВОЗ?

«Эта формулировка используется с 2004 года, когда она была размещена на сайте. Но это никогда не было официальным определением. Вместо этого вам следует ознакомиться с Руководством по обеспечению готовности к пандемии».

- Определение есть на сайте ВОЗ под заголовком: Что такое пандемия гриппа? Но это не определение?

«Я знаю, что вы думаете, что сайт официальный, но это не так. Фразы «огромное количество умерших и больных в результате» никогда не было в Руководстве по обеспечению готовности к пандемии.

Когда именно было внесено изменение в определение на веб-сайте ВОЗ, выяснить не удалось.

Definition of pandemic

Key messages:

WHO did not change the definition of pandemic in the course of this outbreak. A pandemic is declared when there have been verified community-level outbreaks of a new influenza virus, passing from human-to-human, in two or more countries in more than one WHO region.

WHO pandemic preparedness guidelines and other background information is available here: http://www.who.int/csr/disease/influenza/pipguidance2009/en/index.html

WHO's pandemic preparedness guidelines were developed in consultation with Member States and pandemic influenza experts over the course of several years. The 2005 pandemic preparedness guidelines were revised over a two year period of consultation and were finalized in February 2009. These were published in April, just as it appeared we were about to face a new pandemic.

Some of the confusion may stem from the fact that there was a document on WHO's *website for some months that said a pandemic would include* "enormous amounts of cases and deaths". This was removed when it was brought to our attention. This information was never part of the formal definition of a pandemic and was never part of documents sent to Member States for their preparedness work. We regret the confusion it has caused.

WHO has consistently assessed the impact of the current influenza pandemic as moderate, reminding the medical community, public, and media that the overwhelming majority of patients experience mild influenza-like illness and recover fully within a week, even without any form of medical treatment.

СТАТЬЯ ПО ВАМ ПЛАЧЕТ!

Как ВОЗ инсценировала пандемию «свиного гриппа»

Перевод статьи

Michael Fumento. Why The WHO Faked A Pandemic. – Forbes, 5 February 2010

https://redko-da-metko.ru/2021/05/09/kak-voz-inszenirovala-pandemiu-svinogo-grippa/

Всемирная Организация Здравоохранения внезапно перестала кричать: «небо падает!» – как кудахчущая курица. Причина: обвинения в том, что ведомство намеренно разжигало истерию вокруг свиного гриппа. [в 2009-2010 гг]

«Мир переживает настоящую пандемию. Описание его как подделки является неправильным и безответственным», – говорится в заявлении агентства на его веб-сайте.

Представитель ВОЗ отказался уточнить, кто или что дал это «описание», но главного обвинителя трудно игнорировать.

...

Но как организация могла объявить пандемию, когда ее собственное официальное определение требовало «одновременных эпидемий во всем мире с огромным числом смертей и болезней»

Серьезность – то есть количество смертей – имеет решающее значение, потому что каждый год грипп вызывает глобальное распространение болезни

Легко. В мае, в том, что она признала, было прямым ответом на вспышку свиного гриппа месяцем ранее, ВОЗ обнародовала новое определение, соответствующее свиному гриппу, которое просто устранило тяжесть как фактор. Теперь у вас может быть пандемия с нулевой смертностью. Как так?

В середине января на виртуальной конференции ВОЗ по свиному гриппу глава Кэйдзи Фукуда заявил: «изменила ли ВОЗ свое определение пандемии?

Ответ отрицательный: кто не изменил своего определения. Две недели спустя на конференции ПАСЕ он настаивал: «наличие тяжелых смертей никогда не было частью определения ВОЗ.

Они сделали это, но зачем?

Агентство теряло доверие из-за отказа птичьего гриппа H5N1 (по прогнозам) перейти в пандемию и убить до 150 миллионов человек во всем мире, как и предсказывал его «царь гриппа» [глава ВОЗ] в 2005 году.

Страны всего мира прислушались к этим предостережениям и потратили огромные суммы на разработку вакцин и других препаратов. Поэтому, когда свиным гриппом удобно было воспользоваться.

ВОЗ по существу вычеркнула «птичий», вставила «свиной», и генеральный директор ВОЗ Маргарет Чен высокомерно похвасталась: «мир теперь может пожинать плоды инвестиций за последние пять лет в обеспечение готовности к пандемии.»

(Activities and interests statement with Chair)

Change of pandemic influenza definition (around 1 May 09)

- "…resulting in epidemics worldwide with **enormous numbers of deaths and illness"** vanishes
- "Current" definition emphasis on new virus and spread
- Why change? "It was a mistake, and we apologize for the confusion." "(That definition) was put up a while ago and paints a rather bleak picture and could be very scary." The correct definition is that "pandemic" indicates outbreaks in at least two of the regions into which WHO divides the world, but has nothing to do with the severity of the illnesses or the number of deaths" (Natalie Boudou 4th of May 2009)
- And: "We wrote that definition [i.e. the one pre-dating the 4th of May 2009] with avian flu in mind" (Dr Hartl 7 Feb 2010)
- Strange mistake since all WHO pandemic docs (20004-2009) report the pre-4th of May 09 definition and it makes no mention of avian influenza

WHO is accused of "crying wolf" over swine flu pandemic

BMJ, 6 April 2010; 340 doi: https://doi.org/10.1136/bmj.c1904
https://www.bmj.com/rapid-response/2011/11/02/more-changing-webpages-who

Rapid Response:

More changing webpages at WHO

To the Editor:

Since the H1N1 outbreak, the World Health Organization (WHO) appears to be distancing itself from the idea that it ever promoted the concept of an influenza pandemic as an inevitably disastrous event. Last May, the WHO Director-General declared that highly pathogenic avian influenza "H5N1 has conditioned the public to equate an influenza pandemic with very severe disease and high mortality. Such a disease pattern is by no means inevitable during a pandemic. On the contrary, it is exceptional".[1]

I disagree. It is public health organizations - not viruses - that have shaped the public's understanding of pandemic influenza.

In the BMJ last September, I documented how the WHO altered its longstanding definition of "influenza pandemic" a few weeks after the emergence of H1N1.[2] The Organization deleted the phrase "enormous numbers of deaths and illness" from the definition. By the new definition, pandemics need not be severe.

The classification of the H1N1 outbreak as a "pandemic" has been a central concern at the ongoing Council of Europe investigation into the World Health Organization's (WHO) handling of H1N1. UK Member of Parliament Paul Flynn (rapporteur of the inquiry) stated that "A pandemic cannot be whatever the WHO declares it is".[3]

In a "Key Messages" document prepared in response to the inquiry, the WHO writes:

"WHO did not change the definition of pandemic in the course of this outbreak. ... Some of the confusion may stem from the fact that there was a document on WHO's website for some months that said a pandemic would include "enormous amounts of cases and deaths". This was removed when it was brought to our attention. This information was never part of the formal definition of a pandemic and was never part of documents sent to Member States for their preparedness work. We regret the confusion it has caused".[4]

However, what the WHO calls "a document" was in fact the WHO's "Pandemic preparedness" homepage,[5] and the definition including "enormous numbers of deaths and illness" remained on the WHO website not "for some months" but at least six years.[2] Indeed, numerous WHO policy documents over past years consistently described catastrophic morbidity and mortality as a fundamental characteristic of all influenza pandemics. (See box)

Now a second widely cited WHO webpage has been altered. The document was formerly titled "Ten things you need to know about pandemic influenza",[6] four of which included: "Widespread illness will occur", "Medical supplies will be inadequate", "Large numbers of deaths will occur", and "Economic and social disruption will be great". The document has been renamed: "Ten concerns if avian influenza becomes a pandemic".[7] (Table)

By altering the title, the WHO has changed self-described must-know information about "pandemic influenza" into "concerns" about "avian influenza". Most troubling, however, is that the contents (and datestamp) of the document remain unchanged. This raises serious ethical questions about transparency that must be addressed by all committees investigating the pandemic.[3]

Peter Doshi, April 12, 2010

Acknowledgements: Tom Jefferson, for his help locating relevant policy documents.

Box. WHO descriptions of pandemic influenza in policy documents

WHO 1999: "At unpredictable intervals, however, novel influenza viruses emerge with a key surface antigen (the haemagglutinin) of a totally different sub-type from strains circulating the year before. This phenomenon is called "antigenic shift". If such viruses have the potential to spread readily from person-to-person, then more widespread and severe epidemics may occur, usually to a similar extent in every country within a few months to a year, resulting in a pandemic. Annex B provides more information on these issues, and Annex C discusses hypotheses about the origin of pandemic viruses".[8]

WHO 2004: "An influenza pandemic occurs with the appearance of a new influenza virus against which none of the population has any immunity. This results in several simultaneous epidemics worldwide with enormous numbers of cases and deaths".[9]

WHO 2005: 'Influenza pandemics (worldwide epidemics) have occurred at irregular and unpredictable intervals, and have been associated with substantial morbidity, mortality and economic cost. The influenza A virus can cause pandemics and these occur as a result of changes in the virus leading to a sub-type to which no one has immunity, that can spread easily among humans and can give rise to serious disease. Appearance of such a subtype may lead to several simultaneous epidemics worldwide resulting in high numbers of cases and deaths and placing an immense burden on healthcare systems".[10]

WHO 2005: "An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with high numbers of cases and deaths".[11]

WHO 2008: "An influenza pandemic occurs when a novel influenza virus appears against which the human population has limited or no immunity, and which transmits efficiently from person to person, resulting in several simultaneous epidemics worldwide with the potential for considerable morbidity and mortality".[12]

Table. Changing WHO webpages

Before 2009 H1N1 outbreak	Since 2009 H1N1 outbreak	Date of change
WHO 2003: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness" [13]	WHO: "An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity" [5]	May 2009 [14]
WHO 2005-2009: "Ten things you need to know about pandemic influenza" [6]	WHO: "Ten concerns if avian influenza becomes a pandemic" [7]	Between Jun 2009 [15] and 17 Feb 2010 [16]

Parliamentary Assembly
Assemblée parlementaire

Paul Flynn
United Kingdom, SOC

The handling of the H1N1 pandemic: more transparency needed. Report

Strasbourg, Council of Europe, Social Health and Family Affairs Committee, 4 June 2010
http://assembly.coe.int/CommitteeDocs/2010/20100604_H1N1pandemic_e.pdf

A. Draft resolution

1. The Parliamentary Assembly is alarmed about the way in which the H1N1 influenza pandemic has been handled, not only by the World Health Organization (WHO), but also by the competent health authorities at the level of the European Union and at national level. It is particularly troubled by some of the consequences of decisions taken and advice given leading to distortion of priorities of public health services across Europe, waste of large sums of public money, and also unjustified scares and fears about health risks faced by the European public at large.

. . .

5. Notwithstanding the willingness of WHO and the European health institutions concerned to enter into a dialogue and conduct a review of the handling of the pandemic, the Assembly seriously regrets that they have not been willing to share some essential information, in particular to publish the names and declarations of interest of the members of the Emergency Committee of WHO and relevant European advisory bodies directly involved in recommendations concerning the handling of the pandemic. Furthermore the Assembly regrets that WHO has not moved swiftly to revise or re-evaluate its position on the pandemic and the real health risks involved, despite the overwhelming evidence that the seriousness of the pandemic was vastly overrated by WHO at the outset. In addition the Assembly regrets the highly defensive stance taken by WHO, whether in terms of being unwilling to accept that a change in definition of a pandemic was made, or an unwillingness to revise its prognosis on the pandemic. (p. 1)

6. In the light of the widespread concerns raised over the handling of the H1N1 pandemic, the Assembly calls on public health authorities at international, European and national level – and notably WHO – to address in a transparent manner the criticisms and disquiet raised in the course of the H1N1 pandemic, by:

6.1. reviewing the terms of reference of their general governance bodies and special advisory bodies wherever appropriate with a view to ensuring utmost transparency and the highest level of democratic accountability regarding public health decisions;

6.2. agreeing in a transparent manner on a common set of definitions and descriptions concerning influenza pandemics, involving a cross section of expertise, in order to generate a coherent world-wide understanding of such events ... (p. 1-2)

Changing the definition of a pandemic

24. A number of members of the scientific community became concerned when WHO rapidly moved towards pandemic level 6 at a time when the influenza presented relatively mild symptoms. This combined with the change in the definition of pandemic levels just before the declaration of the H1N1 pandemic heightened concerns. As Dr Wolfgang Wodarg, German epidemiologist and

former member of the Parliamentary Assembly highlighted at the public hearing on 26 January 2010, the declaration of the current pandemic was only made possible by changing the definition of a pandemic and by lowering the threshold for its declaration.

25. WHO continues to assert that the basic definition of a pandemic was never changed. Only the description of pandemic alert levels was revised when the document "Pandemic Influenza Preparedness and Response: A WHO Guidance Document" (new title) was updated in May 2009. Notwithstanding these assertions, there is clear evidence that changes were made and that, most importantly, the former criteria of 'impact and severity' of an epidemic in terms of the number of infections and deaths was no longer considered relevant in the updated document21. In other words, the pandemic could be declared without the need to show that it was likely to be severe in terms of its impact on the population (for example regarding severity of illness and death). The definition before 4 May 2009 was worded as follows: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world", whilst the same definition became the following on WHO's website after this date: "A disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity … Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic".

26. Shortly afterwards, WHO spokeswoman Nathalie Boudou justified the change by saying that the "old" definition was in "error" and had been removed from the WHO website. She stated that the correct definition was that a "pandemic indicated outbreaks in at least two of the regions into which WHO divides the world, but has nothing to do with the severity of the illnesses or the number of deaths".22 These subsequent definitions and comments presented at a time when the pandemic was imminent were confusing for both public health professionals involved and attentive observers amongst the European public at large.

27. The rapporteur strongly recommends that further in-depth work be done by all stakeholders concerned with a view to agreeing on a common definition and description of what an influenza pandemic is. This should become the central element of clear international guidelines for national pandemic preparedness planning. He considers that, even if WHO did not intend to modify the pandemic definition in a way that would allow for an accelerated announcement of such an event in June 2009, the changes of relevant disease descriptions and indicators at a time when a major influenza infection was already approaching was highly inappropriate and carried out in a way which could be considered as being non-transparent. It also contributed to the doubts raised concerning undue influence on decision-makers, because all critical observers of the situation wondered if this untimely change was absolutely necessary and question who benefited most from it. (p. 8-10)

...

56. The Parliamentary Assembly should encourage member states to closely follow relevant review processes recently launched within WHO and European institutions involved in public health matters, in order to ensure that their voices may have more impact in future pandemic situations than seems to have been the case in the current H1N1 pandemic. There is strong evidence that some governments, including China, Britain, Japan and a dozen other countries, at some stage of the H1N1 pandemic, urged WHO not to use the proposed new definition of a "pandemic" and "be very cautious about declaring the arrival of a swine flu pandemic, fearing that a premature announcement could cause worldwide panic and confusion." In reply to their doubts, WHO said "it would certainly look at [this issue] very closely" just before declaring the pandemic on 11 June 2009. 4 (p. 15-16).

L'OMS invente l'alerte sanitaire perpétuelle

La Tribune, 16 Juin 2010, 4:31
https://www.latribune.fr/opinions/20100616trib000520642/l-oms-invente-l-alerte-sanitaire-perpetuelle.html

A l'heure de la mondialisation, il est souhaitable que, face à un nouveau virus, les Etats coordonnent la protection de leurs populations. Il est logique que l'organisation mondiale qu'ils ont créée, l'OMS, soit chargée d'élaborer une stratégie commune de réponse à toute menace épidémique émergente, y compris les pandémies grippales. Mais une stratégie internationale de gestion d'une affection émergente doit être bâtie sur une définition précise et stable de l'épidémie à combattre. Qu'en est-il pour la pandémie virale ?

Le 24 avril 2009, jour de "l'alerte sanitaire mondiale" proclamée par l'OMS, quinze cas de grippe étaient attribués au H1N1 type A. Le directeur du CDC (Centre de surveillance des maladies infectieuses aux Etats-Unis), Richard Besser, déclarait alors : "nous allons expertiser le nouveau virus selon trois dimensions : est-il nouveau pour la population ? Cause-t-il des affections sévères ? Est-il aisément transmissible ?" Le 11 juin, le directeur général de l'OMS, Margaret Chan, déclenchait la phase 6 de la pandémie, alors que 144 décès étaient attribués à la grippe A dans le monde. Que s'est-il passé ?

Avant le 4 mai 2009, le site de l'OMS indiquait : "une pandémie de grippe se produit lorsque apparaît un nouveau sous-type de virus dont personne n'est à l'abri. Plusieurs épidémies peuvent se déclarer simultanément dans le monde, provoquant un grand nombre de cas et de décès." Après le 4 mai 2009, sur le même site, les notions de morbidité et de mortalité ont disparu. La pandémie n'aurait pu être déclarée sans ce changement de définition.

En clair, l'OMS a modifié les règles du jeu en cours de partie ! C'est au bout d'une longue maturation que ce changement a été effectué. Les efforts des firmes productrices de vaccins et de certains experts n'y ont toutefois pas manqué ! En témoigne l'examen du compte rendu de la réunion regroupant OMS, agences et firmes à Genève les 11 et 12 novembre 2004, ou celui de l'assemblée de l'ESWI, financée par l'industrie et présidée par le très contesté professeur Osterhaus, réunie en janvier 2009 à Bruxelles.

Malgré la nouvelle définition, le site de l'OMS continue à renvoyer à des recommandations basées sur des prévisions très alarmistes, relayées dans les différents pays. En France, le professeur Flahaut affiche ainsi, le 12 mai 2009, la "prévision modérée" de 30.000 décès. Plus tard, le très officiel Institut de veille sanitaire (INVS) livre en septembre des fourchettes d'évaluation actualisées, allant de 6.400 décès dans le scénario le plus optimiste, à 96.000 décès dans le plus pessimiste, avec 640 à 4.800 décès pour les enfants de 0 à 4 ans... A cette date étaient pourtant connues de nombreuses données provenant de pays ayant connu le pic pandémique, notamment l'Australie, la Nouvelle-Zélande et les pays d'Amérique latine. Les publics vulnérables étaient identifiés, la faible létalité du virus documentée.

Des stratégies de réponse aux pandémies basées sur des prévisions catastrophistes ne peuvent qu'éroder la confiance des populations et des professionnels de santé, surtout si la communication publique y contribue fortement. Ainsi Thierry Saussez, responsable de la communication

gouvernementale, a-t-il indiqué à la commission d'enquête de l'Assemblée nationale que, face à une menace, il fallait partir des prévisions les plus graves... Les hautes capacités des réseaux d'alerte dispersés dans le monde donnent désormais des informations extrêmement précoces : le 24 avril, lorsque l'OMS déclare une "urgence de santé publique de portée internationale", quelques dizaines de syndromes grippaux sans aucun décès sont attribués au H1N1.

A identification très précoce devrait désormais correspondre capacités d'adaptation et de souplesse des plans de gestion de crise sanitaire, en fonction de la dangerosité du virus émergent. Ce n'est pas la voie choisie par l'OMS, appuyée par les avis des experts sélectionnés par l'industrie du vaccin. En retirant le 4 mai la dimension de morbidité-mortalité du phasage de la mise en oeuvre de sa stratégie, l'OMS nous condamne à l'"alerte sanitaire mondiale" à perpétuité.

Slate FR/BLOGS Le journal de la pandémie 2.0

Antoine Flahault
(citant de larges extraits des travaux de Patrick Zylberman,
titulaire de la Chaire d'Histoire de la Santé de l'Ecole des Hautes Etudes en Santé Publique)

OMS: H1N1 Autre Definition?

Slate, 27 June 2010, A(H1N1) Journal de la Pandémie
https://blog.slate.fr/h1n1/2010/06/27/oms-h1n1autre-definition/

L'OMS aurait-elle changé la définition de la pandémie le 4 mai 2009 pour d'obscures raisons?

L'historien Patrick Zylberman, titulaire de la Chaire d'Histoire de la Santé à l'EHESP, dont les travaux portent notamment sur l'histoire des grandes pandémies est forme:

*Contrairement à ce qui est dit parfois (*R. Schabas and N. Rau, janvier 2010*), la définition de la « pandémie » n'a pas été modifiée en 2009. Je parle ici de la définition qui fait loi pour l'Organisation ; je ne parle pas du point de vue exprimé par tel ou tel groupe d'experts.*

Le professeur Zylberman explique que la définition de la pandémie est inscrite dans les plans de préparation, qu'il nous propose de situer dans la hiérarchie des textes produits par l'OMS:

Les plans de préparation pandémique sont des documents inter-gouvernementaux engageant à la fois l'OMS et les Etats membres. Ainsi, la dernière mouture du Plan pandémie d'avril 2009 est le résultat du travail de plus de 135 experts issus de 48 pays ; les travaux ont débuté en 2007 et se sont achevés en février 2009 ; plus de 600 observations ont été déposées par les Etats.

Patrick Zylberman reconnaît cependant que la validité des pages postées sur le site Internet de l'OMS pose parfois problème, et demande à l'OMS d'éclaircir les raisons qui les ont conduit à laisser publier une définition erronée (car différente des plans intergouvernementaux) jusqu'au 4 mai 2009, pour enfin rétablir la version initiale de cette définition, conforme à celle des plans à partir de cette date.

Entrons un peu plus dans les détails de la controverse (pardonnez-nous les citations verbatim en langue anglaise du plan intergouvernemental de l'OMS,* nous n'avions pas la traduction française de ces documents au moment de l'écriture de ce billet). L'OMS en 2009, peut-on lire (Stuart Paterson, nov. 2009), se contenterait d'une vague définition de la pandémie grippale comme «épidémie à l'échelle mondiale», sans plus mentionner les dérives génétiques et antigéniques du virus. «*C'est carrément faux*», s'insurge Patrick Zylberman.

* - https://web.archive.org/web/20090509051754/http://www.who.int/csr/disease/influenza/PIPGuidance09.pdf

Ainsi, le plan Pandémie de l'OMS publié en avril 2009 (page 14) définit-il une pandémie grippale de la manière suivante:

«An influenza pandemic occurs when an animal influenza virus to which most humans have no immunity acquires the ability to cause sustained chains of human-to-human transmission leading to community-wide outbreaks. Such a virus has the potential to spread worldwide, causing a pandemic».

Glissements et cassures sont expressément mentionnées: « The development of an influenza pandemic can be considered the result of the transformation of an animal influenza virus into a human influenza virus. At the genetic level, pandemic influenza viruses may arise through:

• Genetic reassortment: a process in which genes from animal and human influenza viruses mix together to create a human-animal influenza reassortant virus;

• Genetic mutation: a process in which genes in an animal influenza virus change allowing the virus to infect humans and transmit easily among them ».

Le plan Pandémie grippale 2009 de l'OMS ne fait d'ailleurs que reprendre en la développant la définition qui figurait dans la version de 2005 : il y a menace pandémique lorsqu'« un sous-type qui n'a pas circulé chez l'homme pendant au moins plusieurs décennies et vis-à-vis duquel la grande majorité de la population humaine n'est donc pas immunisée » vient à se répandre dans les populations humaines.

Puis survient une nouvelle controverse, à propos de la gravité. Schabas et Rau (janvier 2010, cité ci-dessus) reprochent alors à l'OMS de s'être cramponnée de manière rigide à ses définitions, ignorant le désaccord grandissant entre les faits et ses notions dès la crise mexicaine. Ainsi la définition même de la pandémie a fait l'objet d'un vif débat dans la première période de la pandémie. Patrick Zylberman nous rappelle que "*certains experts suggéraient alors d'intégrer une estimation de la gravité de la maladie dans la définition de la pandémie. Le comité technique de la grippe s'est réunit à Genève le 5 juin 2009 afin de discuter de l'introduction d'un index de gravité à la phase 6 du système d'alerte (le passage à la phase 6 n'était pas à l'ordre du jour de cette réunion). Il s'agissait de diviser la phase 6 en trois sous-niveaux tenant compte du degré de gravité de la maladie (Nebehay, mai 2009). Comme eût dit Victor Hugo, c'eût été là embrouiller un problème par des éclaircissements !*».

L'OMS avait du reste répliqué en mai 2009 à ceux qui exigeaient l'introduction d'une dose de «gravité» dans la définition de la pandémie:

- Que la gravité de la grippe était imprévisible
- Que ce qui apparaît « bénin » dans les pays bien pourvus en médicaments et système de soin peut être « grave » dans les pays qui en sont dépourvus et où l'état général de la population n'est pas très bon
- Que l'OMS a une mission limitée (détermination de l'extension de la transmission, coordination des mesures de santé publique à l'échelle internationale, sélection et lancement de la fabrication du vaccin, supervision des échanges d'informations scientifique) et que c'est aux Etats eux-mêmes à gérer la crise (D. Butler, mai 2009).

Mais laissons les derniers mots de ce billets à notre historien (que je remercie vivement de son éclairage sur cette épineuse question où se mêle beaucoup de mauvaise foi de la part de nombreux experts en verve contre l'organisation internationale) :

«*Le caractère imprévisible et difficilement calculable de la létalité est bien illustré par les soubresauts de de l'opinion des experts en Grande Bretagne en juin et juillet où la létalité estimée a constitué un instrument de « gestion de crise». Cette létalité estimée a connu trois phases:*

- *Très haute dans les scénarios du pire en juillet : voir les déclarations de Liam Donaldson relatives au 65 000 décès prévisibles (devenus 19 000 en septembre et 1 000 en octobre) (Laurance, nov. 2009)*
- *un regain d'anxiété quand l'estimation de l'incidence a été multipliée par 5 dès le passage à la confirmation clinique des cas*
- *une forte estimation à la baisse dans études rétrospectives*

La chute de la létalité estimée au cours du temps: 0,25% en juin/0,026% en décembre (Angleterre et Pays de Galles : 1918=3%; 1957 et 1968 = 0,2%).

Ce débat est d'autant plus surprenant que cela fait longtemps que l'on critique l'idée d'introduire une notion de sévérité dans la définition de la pandémie. Ainsi, dans la revue Science, en mars 1943, un épidémiologiste de l'Université du Michigan, le Dr Thomas Francis, brocardait-il «ceux qui parlent de pandémie grippale comme de quelque chose de spécial et continuent

d'employer ce terme dans l'acception non fondée de sévérité au lieu de distribution», c'est-à-dire de répartition géographique des cas. Le 11 juin, Chan s'en tenait donc à la définition initiale: extension de la propagation à plus d'une région de l'OMS (S Connor, 12 juin 2009, The Independent)».

The "Fake Pandemic" Charge Goes Mainstream and WHO's Credibility Nosedives

Psandman, 29 June 2010
https://www.psandman.com/col/WHO-credibility.htm

...

WHO's Failure to Acknowledge that it Changed Some Flu Pandemic Definitions and Descriptions Just as H1N1 Was Emerging

...

About definitions and redefinitions

All definitions are stipulative. Words don't come with their meanings stenciled on their foreheads. We forge their meanings by how we use them...

WHO cannot decree that the word "pandemic" (or the term "flu pandemic") means just what it chooses. Definitions are negotiated agreements … and sometimes the negotiations break down.

It is always dangerous to use a word in a way you know your audience is likely to misperceive. One of us (Peter) wrote a column on this topic in 2005, entitled "Risk Words You Can't Use." If he were revising that column today, "pandemic" might end up on the list. But we really need the word "pandemic." That's why we have to negotiate what it means, not just stop using it.

Sometimes you redefine a word – use it differently than your audience uses it – in order to point out something important about other people's mental models. That's what the "Risk = Hazard + Outrage" formula tries to do. It redefines "risk" in an effort to persuade people to change how they see the risk communication task. But any time you do that, you know before you start that you'll need to allocate a lot of time and effort to troubleshooting: "People understandably think I mean X when I say that, but I don't. I mean Y. Let me tell you why I'm using the term in such an unexpected way…."

It may have been a mistake for WHO to take on the extra burden of changing its definitions and descriptions of pandemic phases just as novel H1N1 appeared. It was certainly a mistake for WHO to take on this extra burden without taking it seriously as a potential risk communication problem.

And as skepticism and suspicion emerged and then grew, it was a mistake for WHO to avoid conceding (and appear to be denying) the particular changes that had become most salient to the skeptics, and then to a broader audience: the changes in WHO's definitions of the pandemic phases, and the changes in WHO's most prominent definition/description of an influenza pandemic.

If the swine flu pandemic had been more severe, the changes in WHO's pandemic phase definitions wouldn't have mattered much. And the absence of a severity criterion in WHO's definition/description of an influenza pandemic would have made no difference at all. But once the moderate/mild mismatch arose between WHO's portrayal of the pandemic and the public's view of it, the need to acknowledge and explain the redefined flu pandemic phases and the revised definition/description of an influenza pandemic became urgent. Yet WHO chose not to provide the needed acknowledgments and explanations.

For years, the word "pandemic" and the phrase "flu pandemic" meant absolutely nothing to most people. These were terms of art, used almost exclusively by experts. In much of the world, even the word "influenza" still doesn't ring a bell, while the word "flu" often refers to any mild respiratory infection, and sometimes even non-respiratory ones.

Experts, meanwhile, have often used "pandemic" and "flu pandemic" rather loosely.

In the professional literature, there are varying definitions of influenza pandemics. Pretty much all the definitions specify that a flu pandemic is a widespread outbreak of a novel flu virus subtype that does significant health harm to humans. But how widespread, how novel, and how much harm are sometimes specified in discrepant ways, and often not specified at all. With regard to novelty, for example, some definitions state that a population must have "no" immunity, while others state that there must be "little immunity." Some definitions say categorically that a "new subtype" of influenza is required, implying that a reassorted, antigenically shifted virus of the same subtype as one that is currently circulating cannot be considered "novel" enough to cause a pandemic, nor can one that re-emerges from a laboratory freezer decades after it last circulated. Other definitions stipulate that a subtype can be considered "novel" enough even with the same H and N as a currently or previously circulating flu virus.

Moreover, there is a huge professional literature that describes flu pandemics in ways that often go beyond the specifications in formal definitions. The boundary between definitions and descriptions isn't a bright line. This unclear boundary has figured periodically in the controversy over what exactly WHO did just as the novel H1N1 virus was beginning to spread. Leave aside the poorly framed charge that WHO changed the definition of a pandemic. Did it change the definition of a flu pandemic? Or did it merely publish yet another description of what flu pandemics are like? Do new definitions of the phases of flu pandemics constitute, collectively, a new definition of a flu pandemic – or do they just describe it differently?

This much is indisputable: WHO did change the role of severity in its definitions and descriptions of the phases of an influenza pandemic. It is those phase definitions and descriptions that ultimately determine whether and when WHO declares that an influenza pandemic has begun. Whether or not WHO redefined the term "flu pandemic," it did rejigger the criteria for declaring a flu pandemic. In particular, it took severity off the list of potential criteria.

How and why WHO changed its use of the term "influenza pandemic"

The word "pandemic" came into common use among nonprofessionals only when WHO and other health agencies started issuing warnings about the specter of bird flu. Bird flu (H5N1) in humans is certainly a novel subtype. And it is potentially incredibly serious; so far, it has killed over half the people who caught it – compared to 2–3 percent for the 1918 pandemic (the poster child of serious flu pandemics) and well under one tenth of one percent for swine flu so far.

The saving grace of bird flu is that it's extremely difficult to catch. Except for a handful of conspiracy nuts who murmur about cover-ups, there is universal agreement that bird flu is a panzootic or epizootic (among birds), but not a pandemic or epidemic because as a human disease it is rare and hard to catch, not widespread and easy to catch. Bird flu won't go pandemic unless the virus acquires the ability to pass easily from one person to another. If that ever happens, and if the bird flu virus remains anywhere near as virulent as it is today, it will be by far the worst influenza pandemic (and the worst disease catastrophe) in history.

Bird flu warnings said, in essence: "A bird flu pandemic might well be horrific. Thank God bird flu hasn't gone pandemic yet. Hope to God it never does." So if the general public learned *any* definition of a pandemic, it learned a scary one.

With bird flu in the backs of their minds, WHO officials kept on refining and streamlining the complex WHO guidance document for phased planning and response before, during, and after influenza pandemics.

In the 1999 and 2005 versions, severity had been one of many factors that would (1999) or could (2005) be taken into account in decisions about whether to raise the pandemic phase in the run-up to declaring a pandemic.

Here's a key reference to severity in the 1999 version:

The Pandemic will be declared when the new virus sub-type has been shown to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that *serious morbidity and mortality* is likely in at least one segment of the population.

In the 2005 version, severity appears most prominently in this footnote, appended to the definitions of pandemic phases and reiterated five times throughout the document:

The distinction between *phase 3, phase 4* and *phase 5* is based on an assessment of the risk of a pandemic. Various factors and their relative importance according to current scientific knowledge may be considered. Factors may include: rate of transmission; geographical location and spread; severity of illness; presence of genes from human strains (if derived from an animal strain); other information from the viral genome; and/or other scientific information.

Officials and their expert advisors had reservations about both of these formulations. The severity of a flu outbreak can vary from region to region. It isn't necessarily obvious in the early days of a new flu virus, and it can change suddenly (or slowly) as the virus mutates. It was clear that severity should be considered in figuring out what to do about a pandemic, but it was also clear that a pandemic, even a very serious pandemic, could look mild at the outset. Two of the last three pandemics had second waves more severe than the first – in the case of 1918, vastly more severe.

So when WHO published its revision of the 2005 guidance document in April 2009, the newest version included the warning that "if symptoms are mild and not very specific, an influenza virus with pandemic potential may attain relatively widespread circulation before being detected; thus, the global phase may jump from Phase 3 to Phases 5 or 6." The new version also removed the footnote that had been in the 2005 version, the footnote that had specified severity as one of the factors that "may" be considered when ratcheting from pandemic Phase 3 to 4 to 5. In the 2009 document, the revised phases were introduced in a section explicitly entitled "Definition of the phases."

Of course the official WHO influenza pandemic "guidance document" wasn't the only document WHO published that talked about flu pandemics. There were lots of others. One that became controversial after novel H1N1 emerged was a document entitled "Pandemic Preparedness," which had been on the WHO website since as early as February 2003. (Note: This page, originally on the WHO website, is now privately archived and may load very slowly.) Its very first paragraph offered a flu pandemic definition/description of its own that put severity front-and-center – far more so than any version of the guidance document:

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with *enormous numbers of deaths and illness*.

The 2009 updated guidance document had been in the works for a couple of years. But it was hurriedly posted on the WHO website just two or three days after H1N1 was first identified in late April 2009. Posted at the same time was a two-paragraph note explaining why WHO thought a new version was needed. The explanation did not mention anything about severity as an issue in the run-up to a pandemic declaration, most likely because it never occurred to WHO that eliminating references to severity was going to look evil later when people started wondering whether WHO had invented a fake pandemic-for-profit … a possibility that never crossed WHO officials' minds.

It is crucial to remember that at the time the new guidance document was posted, the early news from Mexico was terrifying. On April 24, WHO issued its first announcement about the mysterious pneumonia cases in Mexico City:

In the Federal District of Mexico, surveillance began picking up cases of ILI starting 18 March. The number of cases has risen steadily through April and as of 23 April there are now more than 854 cases of pneumonia from the capital. Of those, 59 have died.

If that initial assessment from Mexico had been representative of swine flu's ultimate case fatality rate, we would have been at the start of a pandemic about three times as bad as the pandemic of

1918. Fairly quickly – but not instantaneously – it became clear that there were far more cases (and thus a much lower percentage of deaths) than the earliest Mexico City news had suggested. Within weeks, the case fatality rate of the new flu virus began to look more like the data from the much milder pandemics of 1957 and 1968. By mid-summer it begin to look like the new pandemic might even be milder than the seasonal flu, in terms of its case fatality rate. But the first official Mexican report, in conjunction with cases popping up in California and Arizona, was justifiably terrifying to anyone who understood how bad a flu pandemic could be.

In April 2009, when WHO posted its newest version of its pandemic guidance document, it simply wasn't worrying about a pandemic that might be too mild to qualify as real.

When WHO posted its new 2009 guidance document, it took the 2005 version off its website – though of course any reasonably skilled computer user could easily find cached copies and repost them. (Note: It is back on again.) Nor did WHO scour its website for other WHO documents with inconsistent references to pandemic severity. There were higher priorities. And officials were no doubt used to such inconsistencies, and used to reading past them.

But about a week after the new guidance document was posted, a CNN reporter asked WHO officials about that "Pandemic Preparedness" document, the one that said a flu pandemic involved "enormous numbers of deaths and illness." WHO immediately removed the document from its website – and, needless to say, the critics (and even non-critics) immediately found cached versions to post on their own websites.

The version of the "Pandemic Preparedness" page that's posted on the WHO website today has new definitions/descriptions of both a generic pandemic and an influenza pandemic. It doesn't say anything about enormous numbers of deaths. It emphasizes that "Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic." So "mild" is still a contender. It also states that "An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity." No immunity? Does that mean that novel H1N1 can't have caused a pandemic, since many people had some immunity? It is really hard to get these definitions/descriptions just right, especially if people are going to hold you to them. So it's silly to get defensive when you decide to change them.

What about the earlier version of "Pandemic Preparedness," the one that specified "enormous numbers of deaths"? Here's what WHO communication officer Natalie Boudou told the CNN reporter who first asked about it: "It was a mistake, and we apologize for the confusion…. [That definition/ description] was put up a while ago and paints a rather bleak picture and could be very scary."

Months later, much more senior WHO officials would repeatedly insist that they had never, ever, changed the "definition" of a "pandemic," and that severity had never been a potential criterion – ignoring both their abandonment of that footnote in the 2005 guidance document and their quick effort to disappear the older version of the "Pandemic Preparedness" document. Natalie Boudou could have taught them how to acknowledge an indisputable reality more gracefully.

WHO did not update its pandemic guidance and pandemic phase definitions in order to justify declaring swine flu a pandemic. We can find nothing in the 1999 or 2005 guidance documents that would have stopped WHO from declaring that a pandemic was underway in June 2009. In fact, WHO might have declared swine flu a pandemic earlier under the old standards than the new, because the new ones had tougher criteria for geographical spread, requiring WHO to wait until the disease was spreading widely in at least two WHO regions. Because North and South America were part of the same WHO region, the new guidance document meant waiting until the swine flu virus was spreading widely in Europe as well.

WHO was simply trying to give national governments the benefit of its best, most recent thinking about flu pandemic phases as the world confronted the novel H1N1 virus.

Throughout May and June 2009, WHO – advised by its new Emergency Committee – kept trying to assess whether H1N1 met the criteria for Phase 6, a full-fledged influenza pandemic. Many

influenza experts argued that it did, and chafed at WHO's hesitation. But many national governments were afraid of over-alarming their publics, and successfully convinced WHO to wait. Their best technical argument was that H1N1 didn't yet meet the new widespreadness criteria.

There wasn't a lot of discussion back then about whether H1N1 was too mild to be called a pandemic. Mortality data in May and June were far less alarming than the earliest news from Mexico had been. H1N1 was beginning to look like a mild pandemic, more like the 1957 and 1968 pandemics than the horrific 1918 pandemic. But it was early days yet. The data on pandemic severity were still extremely spotty and tentative, and no one had any basis for deciding that H1N1 would or wouldn't become more virulent as it spread.

So yes, right after H1N1 was identified as a novel flu virus causing human-to-human spread in Mexico, WHO introduced new flu pandemic phase definitions that did not include an earlier footnote specifying that "severity of illness" "may be considered" as one of many factors in assessing the distinctions among phases 3, 4, and 5.

But WHO didn't make this change in order to make it easier to declare H1N1 a pandemic. If anything, the new phase definitions/descriptions made it harder for WHO to declare H1N1 a pandemic, because they gave national governments an argument that the virus wasn't widespread enough yet. But we don't think they were introduced for that purpose either. They were introduced because they were more in line with current knowledge, and with changes in the International Health Regulations and other protocols that had been updated since 2005. And they were introduced because they had been in development for about two years, and suddenly it looked like they were urgently needed right now.

...

N° 685

SÉNAT

SESSION EXTRAORDINAIRE DE 2009-2010

Rapport remis à Monsieur le Président du Sénat le 29 juillet 2010

Enregistré à la Présidence du Sénat le 29 juillet 2010

Dépôt publié au Journal Officiel - Édition des Lois et Décrets du 30 juillet 2010

RAPPORT

de la **commission d'enquête** *(1) sur le* **rôle** *des* **firmes pharmaceutiques** *dans la* **gestion** *par le* **Gouvernement** *de la* **grippe A (H1N1)v**, *créée sur la demande du groupe Communiste, Républicain et Citoyen et des sénateurs du Parti de Gauche, dont la Conférence des Présidents a pris acte le 10 février 2010, en vertu de l'article 6* bis, *alinéa 3, du Règlement du Sénat.*

Tome I : rapport

Président
M. François AUTAIN,

Rapporteur
M. Alain MILON,

Sénateurs.

2. La «fausse pandémie»

https://www.senat.fr/rap/r09-685-1/r09-685-111.html

Les critiques sur la fausse alerte pandémique ont été renforcées par le changement de définition de la pandémie grippale auquel aurait procédé l'OMS, dans les mois ayant précédé la déclaration du passage en phase 6 le 11 juin 2009. Dans sa proposition de recommandation, à l'origine du rapport de l'APCE présenté par M. Paul Flynn, M. Wolfgang Wodarg évoque ainsi de «*fausses pandémies*».

Le programme mondial 2009 de l'OMS de lutte contre une pandémie grippale s'inscrit dans le cadre défini par le règlement sanitaire international (RSI) révisé en 2005. Le RSI révisé a établi une procédure en cas d'«*urgence de santé publique de portée internationale*», et non de pandémie, ce terme ne figurant pas dans le RSI. En application des dispositions du premier alinéa (1.) de l'article 12 du RSI, « *le directeur général détermine, sur la base des informations qu'il reçoit, en particulier de l'Etat Partie sur le territoire duquel un événement se produit, si un événement constitue une urgence de santé publique de portée internationale* ».[47]Les recommandations de l'OMS faisant suite au passage en phase 6 du niveau d'alerte pandémique ont été la réponse à une urgence de santé publique.

Cependant, lors de son audition par la commission d'enquête,[48] M. Tom Jefferson a observé que «*la grippe pandémique est ce que l'OMS décide qu'elle est*», en s'appuyant sur les travaux d'un étudiant doctorant à Harvard, M. Peter Doshi, à qui l'utilisation d'un logiciel Internet, Wayback Machine, a permis de retrouver les anciennes définitions : de 2003 à 2009, une pandémie a été définie par l'apparition de «*plusieurs épidémies simultanées à travers le monde avec un grand nombre de décès et de maladies*»; un changement a été opéré entre le 1er et le 9 mai 2009, faisant disparaître le critère de gravité. Toujours selon ces travaux, le contenu des pages Internet de l'OMS a été modifié, sans changer la date affichée.

Pour sa part, l'OMS affirme que la définition de base de la pandémie n'a jamais changé. Citée par M. Tom Jefferson lors de son audition par la commission des questions sociales, de la santé et de la famille de l'Assemblée parlementaire du Conseil de l'Europe le 29 mars 2010, Mme Nathalie Boudou, porte-parole de l'OMS, a justifié le changement de définition sur le site de l'OMS par la correction d'une «*erreur*», en affirmant que la définition correcte d'une pandémie devait faire référence à l'apparition de foyers dans au moins deux régions du monde, mais n'avait rien à voir avec la gravité de la maladie ou le nombre de décès.[49]

La comparaison des documents de l'OMS *(cf. encadré ci-après)* montre que, dès 1999, les critères de nouveauté et d'extension géographique du virus ont toujours été au coeur de la définition de la pandémie (dont l'étymologie même renvoie à sa seule diffusion), avant la gravité «*probable*» que revêt une pandémie. En 2005, si la gravité n'est qu'un des critères de passage d'une phase à une autre dans le plan mondial actualisé de l'OMS de préparation à une pandémie, un autre document de l'OMS de planification face à une pandémie grippale mentionne un «*grand nombre de cas et de décès*». En revanche, dans le programme mondial de l'OMS d'avril 2009 de lutte contre une pandémie grippale, selon la version actuellement consultable sur son site Internet,[50] la gravité n'est plus un critère de définition de la pandémie.

Evolution de la définition d'une pandémie grippale par l'OMS

En 1999

Dans le plan mondial de l'OMS de 1999 de préparation à une pandémie de grippe, une pandémie apparaît lorsque sont réunis des critères géographiques et de gravité:

«*La pandémie sera déclarée quand il aura été montré qu'un nouveau sous-type de virus a causé des flambées sérieuses dans au moins un pays et s'est étendu à d'autres pays, avec des types de maladies indiquant qu'une grave morbidité et mortalité sont probables dans au moins un segment de la population*» («The Pandemic will be declared when the new virus sub-type has been shown to

cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that serious morbidity and mortality is likely in at least one segment of the population»).[51]

En 2005

Dans le plan mondial de l'OMS de 2005 de préparation à une pandémie de grippe,[52] la pandémie correspond à une «*transmission accrue et durable dans la population générale*». Si la «*gravité de la maladie*» figure explicitement (note p. 9) parmi les critères permettant de distinguer les phases 3, 4 et 5, les exemples donnés en phase 5 prévoient, en revanche, la possibilité de cas isolés et en nombre limité, avant le déclenchement de la phase 6.

Mais dans la «Liste de contrôle OMS pour la planification préalable à une pandémie de grippe» diffusée par l'OMS en avril 2005,[53] la pandémie est définie explicitement par un grand nombre de cas et de décès:

«Une pandémie de grippe survient lorsqu'apparaît un virus nouveau contre lequel le système immunitaire humain est sans défense, donnant lieu à une épidémie mondiale provoquant un nombre considérable de cas et de décès. Le nouveau virus grippal est d'autant plus susceptible de se propager rapidement dans le monde que les transports internationaux ainsi que l'urbanisation et les conditions de surpeuplement s'intensifient».

En 2009

Le plan mondial 2009 de l'OMS de préparation à une pandémie de grippe définit clairement la pandémie du seul point de vue de sa diffusion géographique :

- en phase 5: des «flambées soutenues à l'échelon communautaire dans au moins deux pays d'une même région OMS» ;

- en phase 6, le virus provoque « des flambées soutenues à l'échelon communautaire dans au moins un pays d'une autre région de l'OMS».[54]

Les critères de définition d'une pandémie ont donc été modifiés, un peu plus d'un mois avant le passage en phase 6, le 11 juin 2009, pour une pandémie alors reconnue comme étant «*de gravité modérée*». Cependant, rien n'indique une modification intentionnelle de la définition, la procédure suivie par l'OMS répondant à une urgence de santé publique internationale, en application du dispositif prévu par le RSI modifié en 2005.

Lors de son audition par la commission d'enquête, M. Wolfgang Wodarg a cependant estimé que la déclaration de l'état de pandémie a été permise par le changement de définition,[55] en s'interrogeant sur l'influence de l'industrie pharmaceutique qui se préparait de longue date à une nouvelle pandémie grippale. La proposition de recommandation de M. Wolfgang Wodarg estime que «*le soin de définir une pandémie alarmante ne doit pas être soumis à l'influence des marchands de médicaments*».

Ces interrogations soulèvent la question de la gestion par l'OMS des conflits d'intérêts entre ses experts et l'industrie pharmaceutique.

The elusive definition of pandemic influenza

L'insaisissable definition de la grippe pandemique
La evasiva definicion de la gripe pandemica

Bulletin of the World Health Organization, 1 July 2011, 89(7): 532-538.
doi: 10.2471/BLT.11.086173
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3127275/

Abstract:

There has been considerable controversy over the past year, particularly in Europe, over whether the World Health Organization (WHO) changed its definition of pandemic influenza in 2009, after novel H1N1 influenza was identified.

Some have argued that not only was the definition changed, but that it was done to pave the way for declaring a pandemic. Others claim that the definition was never changed and that this allegation is completely unfounded. Such polarized views have hampered our ability to draw important conclusions.

This impasse, combined with concerns over potential conflicts of interest and doubts about the proportionality of the response to the H1N1 influenza outbreak, has undermined the public trust in health officials anal our collective capacity to effectively respond to future disease threats.

WHO did not change its definition of pandemic influenza for the simple reason that it has never formally defined pandemic influenza. While WHO has put forth many descriptions of pandemic influenza, it has never established a formal definition and the criteria for declaring a pandemic caused by the H1N1 virus derived from "pandemic phase" definitions, not from a definition of "pandemic influenza".

The fact that despite ten years of pandemic preparedness activities no formal definition of pandemic influenza has been formulated reveals important underlying assumptions about the nature of this infectious disease. In particular, the limitations of "virus-centric" approaches merit further attention and should inform ongoing efforts to "learn lessons" that will guide the response to future outbreaks of novel infectious diseases.

Introduction

In 2009, governments throughout the world mounted large and costly responses to the H1N1 influenza outbreak. These efforts were largely justified on the premise that H1N1 influenza and seasonal influenza required different management, a premise reinforced by the decision on the part of the World Health Organization (WHO) to label the H1N1 influenza outbreak a “pandemic”. However, the outbreak had far less serious consequences than experts had predicted, a fact that led many to wonder if the public health responses to H1N1 had not been disproportionately aggressive.[1–3] In addition, concern over ties between WHO advisers and industry fuelled suspicion about the independence and appropriateness of the decisions made at the national and international levels.[4]

Central to this debate has been the question of whether H1N1 influenza should have been labelled a “pandemic” at all. The Council of Europe voiced serious concerns that the declaration of a pandemic became possible only after WHO changed its definition of pandemic influenza. It also expressed misgivings over WHO’s decision to withhold publication of the names of its H1N1 advisory Emergency Committee.[3] WHO, however, denied having changed any definitions and defended the scientific validity of its decisions, citing “numerous safeguards” for handling potential conflicts of interest.[5]

At stake in this debate are the public trust in health officials and our collective capacity to respond effectively to future disease threats. Understanding this controversy entails acknowledging that both parties are partially correct, and to resolve it we must re-evaluate how emerging threats should be defined in a world where the simple act of labelling a disease has enormous social, economic and political implications.

What sparked the controversy

Since 2003, the top of the WHO Pandemic Preparedness homepage has contained the following statement: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several simultaneous epidemics worldwide with enormous numbers of deaths and illness."[6] However, on 4 May 2009, scarcely one month before the H1N1 pandemic was declared, the web page was altered in response to a query from a *CNN* reporter.[7] The phrase "enormous numbers of deaths and illness" had been removed and the revised web page simply read as follows: "An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity." Months later, the Council of Europe would cite this alteration as evidence that WHO changed its definition of pandemic influenza to enable it to declare a pandemic without having to demonstrate the intensity of the disease caused by the H1N1 virus.[3]

A description versus a definition

Harvey Fineberg, chairman of a WHO-appointed International Health Regulations (IHR) Review Committee that evaluated WHO's response to H1N1 influenza, identified the definition of pandemic influenza as a "critical element of our review".[8] In a draft report released in March, the committee faulted WHO for "inadequately dispelling confusion about the definition of a pandemic" and noted WHO's "reluctance to acknowledge its part in allowing misunderstanding"[9] of the web page alteration, which WHO has characterized as a change in the "description" but not in the "definition" of pandemic influenza. "It's not a definition, but we recognize that it could be taken as such … It was the fault of ours, confusing descriptions and definitions",[10] a WHO communications officer declared. Indeed, the Council of Europe was not alone in claiming that the "definition" had been changed.[7,11,12]

WHO argues that this phrase – which could be more neutrally referred to as a *description–definition* – had little bearing on policy responses; a WHO press release states that it was "never part of the formal definition of a pandemic" and was never sent to Member States, but simply appeared in "a document on WHO's website for some months".[13] In actuality, the *description–definition* was displayed at the top of the WHO Pandemic Preparedness home page for over six years and is consistent with the descriptions of pandemic influenza put forth in various WHO policy documents over the years.[14–16] However, while the original *description–definition* unambiguously describes disease severity and certainly reflects general assumptions about pandemic influenza before novel H1N1 emerged, it is unrelated to the criteria WHO applied to declare H1N1 influenza a pandemic.

Definitions of pandemic phases, not pandemic influenza

In a press conference, WHO explained that "the formal definitions of pandemics by WHO can be seen in the guidelines".[5] This was a reference to WHO's pandemic influenza preparedness guidelines, first developed in 1999 and revised in 2005 and 2009. However, none of these documents contains what might reasonably be considered a formal definition of pandemic influenza (Table 1), a fact that may explain why WHO has refrained from offering a quotable definition despite its repeated assurances that "the definition" was never changed.[5,13,20] The startling and inevitable conclusion is that despite ten years of issuing guidelines for pandemic preparedness, WHO has never formulated a formal definition of pandemic influenza.

What WHO's pandemic preparedness guidelines19 do contain are "pandemic phase" definitions. WHO declared a pandemic on 11 June 2009, after determining that the novel reassortant H1N1 virus was causing community-level outbreaks in at least two WHO regions, in keeping with the definition of pandemic phase 6. The declaration of phase 6 reflected wider global dissemination of H1N1, not disease severity. But unlike other numerical scales, such as the Saffir–Simpson Hurricane

Wind Scale based on five "categories", WHO's six-point pandemic phase determinations do not correlate with clinical severity but rather with the likelihood of disease occurrence.[21] This point has received widespread attention and criticism.[3,7,22,23]

"The phased approach to pandemic alert was introduced by WHO in 1999," explained WHO Director-General Margaret Chan to the IHR Review Committee, "to allow WHO to gradually increase the level of preparedness and alert without inciting undue public alarm. In reality, it had the opposite effect".[24] Indeed, WHO's concern that declaring phase 6 could "cause an unnecessary panic"[25] may explain why it momentarily considered adding a severity index to its phasing system before declaring phase 6.22 WHO subsequently decided that developing a pandemic severity index was too complex.[23] However, the IHR Review Committee has called on WHO to "develop and apply measures that can be used to assess the severity of every influenza epidemic", while noting that "assessing severity does not require altering the definition of a pandemic to depend on anything other than the degree of spread".[9]

WHO's defence of its decision to declare H1N1 influenza a pandemic because it met "hard to bend", "clearly defined virological and epidemiological criteria"[26] overlooks the fact that these criteria changed over time. As Gross noted, under WHO's previous (2005) guidelines the 2009 H1N1 virus would not have been classified as a pandemic influenza virus simply because it was not a new subtype.[27] The 2009 plan, by contrast, only required a novel "reassortant" virus (Table 1).

Statements from WHO such as "Is this a real pandemic. Here the answer is very clear: yes"[5] suggest that pandemics are something inherently natural and obvious, out there in the world and not the subject of human deliberation, debate and changing classificatory schemes. But what would and would not be declared a pandemic depends on a host of arbitrary factors such as who is doing the declaring and the criteria applied to make such a declaration.

Bridging the gap

Had the novel 2009 H1N1 virus caused exceptionally severe disease, the extensive preparations and planning in recent years would have surely put us in a better position to respond to such a crisis, and decision-making at WHO would not have come under intense scrutiny.[28] But in the case of H1N1, governments mounted extraordinary and costly responses to what turned out to be mostly ordinary disease.[29,30] This resulted in much scrutiny and controversy over the decision-making process. As future policy responses to emerging infectious diseases will not succeed without the trust and understanding of the public, officials must revise the way they think about and characterize emerging diseases.

A first step is to openly acknowledge past failures in risk assessment. The description–definition of pandemic influenza that was on WHO's web site for so long, unchallenged and unchanged for years, is perhaps the most striking illustration that expert institutions assumed pandemics to be, in their basic nature, catastrophic events. (According to the IHR Review Committee, the description–definition was "understandable in the context of expectations about [avian influenza] H5N1",[9] but its appearance dates back to at least early 2003, when only 18 human cases of H5N1 were known.)[6] But it is by no means the only example of false assumptions. A 2005 WHO preparedness document titled Ten things you need to know about pandemic influenza31 stated that "large numbers of deaths will occur" and "economic and social disruption will be great". Statistical projections of future pandemic mortality varied widely, but even the self-described "best case scenarios"[32] yielded numbers that were four to 30 times greater than the estimated number of deaths from seasonal influenza.[33] Also, over the last five years public health experts and policy-makers have helped consolidate the idea that a pandemic is of necessity a catastrophe through repeated mention of the severe 1918 pandemic "in order to rouse governments and the public".[34] Descriptions of H5N1 as a pandemic candidate virus because it had met all the "requirements" only reinforced the message that a serious outbreak was inevitable (Fig. 1). The focus on 1918 and H5N1 came at the cost of preparing for possible future outbreaks similar to the 1957 and 1968 pandemics. These outbreaks, in contrast to the one in 1918, were similar to seasonal influenza and sometimes milder;[37–39] indeed,

historical descriptions of events in 1957 and 1968 have been mixed, a fact that highlights the lack of standardized measures of severity (Table 2). Preparations for future outbreaks must take stock of all the evidence, not just the most alarming.

Second, it is time to re-examine assumptions driven by virus-centric thinking. The fact that the spread of overwhelmingly mild[47] disease by a "novel" virus such as H1N1 could meet current phase 6 criteria highlights the shortcomings of virological assumptions and their central role in defining pandemic response measures. The enduring belief is that highly transmissible novel influenza viruses can be expected to cause serious disease and even death because the population lacks immunity against them.[49] However, this view is challenged by the recent experience with H1N1 and other influenza pandemics.[37,50–52] During the 2009 H1N1 outbreak, relatively few elderly people got sick,[51,53,54] despite the widespread circulation of the so-called novel virus, and when they did, the symptoms were mild in most cases.

Virus-centric thinking is also at the bottom of the current practice of dichotomizing influenza into "pandemic" and "interpandemic" or "seasonal" influenza on the basis of genetic mutations in the virus. This approach, however, ignores the fact that the severity and impact of epidemics, whether caused by influenza viruses or other pathogens, occur along a spectrum and not in catastrophic versus non-catastrophic proportions. We need responses that are calibrated to the nature of the threat rather than driven by these rigid categories.[11] The IHR Review Committee has called for simplifying the pandemic phase structure and for plans that "emphasize a risk-based approach to enable a more flexible response to different scenarios".[9] However, implementing this will remain difficult as long as health officials feel compelled to "err on the side of safety"[9] and respond to any novel influenza virus as if it were potentially a worst case scenario. We therefore need evidence-based ways to address hypothetical scenarios of non-zero probability, such as the fear – based on a very partial reading of history[55] – that novel influenza pathogens acquire increased virulence during successive "waves" of infection.

Virus-centric thinking may heavily influence pandemic influenza planning because of the considerable weight of expert opinion. Bonneux and Van Damme have argued that disease experts are not necessarily competent to judge a disease's relative importance against competing health priorities, and "final evidence-based policy advice should be drafted by independent scientists trained in evaluation and priority setting".[56] This advice is consistent with the views of Neustadt and Fineberg, who noted over three decades ago in their review of the 1976 swine flu affair in the United States of America that "panels tend toward 'group think' and over-selling, tendencies nurtured by long-standing interchanges and intimacy, as in the influenza fraternity. Other competent scientists, who do not share their group identity or vested interests, should be able to appraise the scientific logic applied to available evidence."[57] However, the IHR Review Committee's draft report, issued in March 2011, is less demanding. It calls for an "appropriate spectrum of expertise" to advise WHO's Director-General but fails to specify whether this should include non-influenza experts such as general epidemiologists, general practitioners and health economists.[9]

Third, we must come to broader agreement about acceptable sources of expert advice. While the IHR Review Committee "found no evidence of malfeasance", it urged WHO to "clarify its standards and adopt more transparent procedures for the appointment of members of expert committees".[9] Since the 1980s, "partnerships" between industry and academia have grown increasingly close.[58] Today, for example, both government officials and academic influenza scientists belong to the Neuraminidase Inhibitor Susceptibility Network, a group funded by GlaxoSmithKline and Roche.[59] Much work is needed to ensure that decisions are not unwittingly influenced by industrial interests.

Finally, we must remember the purpose of "pandemic preparedness", which was fundamentally predicated on the assumption that pandemic influenza requires a different policy response than does annual, seasonal influenza. The "pandemic" label must of necessity carry a notion of severity, for otherwise the rationale behind the original policy of having "pandemic plans" distinct from ongoing public health programmes would be called into question. Insofar as these plans allow us to effectively

respond to the spread of severe infectious diseases, regardless of the pathogen that causes them, planning for hypothetical "worst case" scenarios has value. But such scenarios are rare and, when they do occur, few people will require convincing that urgent action is needed. Indeed, if we do face the threat of widespread disease causing severe symptoms, the definition of pandemic influenza will likely become moot.

Depuis l'an dernier, il existe une importante controverse, en particulier en Europe: l'Organisation mondiale de la Sante (OMS) a-t-elle change ou non sa definition de la grippe pandemique en 2009, apres l'identification de la grippe H1N1 originale?

Certains ont soutenu que non seulement cette definition a ete modifiee, mais qu'elle l'a ete dans le but de preparer la declaration d'une pandemie. D'autres ont explique que la definition n'a jamais ete changee et que cette allegation est denuee de tout fondement. Ces vues polarisees ont gene notre capacite a tirer des conclusions importantes.

Cette impasse, associee aux preoccupations sur les conflits d'interets potentiels et aux doutes sur la proportionnalite de la reponse a, l'apparition de la grippe H1N1, a sape la confiance publique envers les autorites sanitaires et envers notre capacite collective a repondre de maniere efficace aux menaces des maladies futures.

L'OMS n'a pas modifie sa definition de la grippe pandemique pour la simple raison qu'elle ne l'a jamais definie de maniere officielle. Alors que l'OMS a propose de nombreuses descriptions de la grippe pandemique, elle n'a jamais elabore une definition formelle. De plus, les criteres de declaration d'une pandemie causee par le virus H1N1 ont leur origine dans les definitions de la , et non dans une definition de la .

Le fait que, malgre dix annees d'activites de preparation a une pandemie, aucune definition officielle de la grippe pandemique n'ait ete formulee revele des hypotheses sous-jacentes importantes sur la nature de cette maladie infectieuse. Les limitations des approches meritent en particulier une plus grande attention et doivent contribuer aux efforts incessants pour qui guideront la reponse aux apparitions futures de nouvelles maladies infectieuses.

Durante el pasado ano, fundamentalmente en Europa, se genero una considerable polemica sobre si la Organizacion Mundial de la Salud (OMS) habria cambiado su definicion de gripe pandemica en el ano 2009, tras la identificacion de la nueva gripe H1N1.

Algunos argumentan que no solo se cambio la definicion, sino que se hizo para despejar el camino hacia la declaracion de una pandemia. Otros aseguran que la definicion nunca se cambio y que esta alegacion esta completamente infundada. Estos puntos de vista tan opuestos han dificultado nuestra capacidad para extraer conclusiones relevantes.

Este callejon sin salida, unido a las preocupaciones sobre los posibles conflictos de intereses y las dudas sobre la proporcionalidad de la respuesta al brote de la gripe H1N1, ha menoscabado la confianza de la poblacion en los responsables de la salud y en nuestra capacidad colectiva para responder con eficacia a futuras amenazas de este tipo.

La OMS no cambio su definicion de gripe pandemica por el simple motivo de que nunca antes habla definido formalmente el concepto de gripe pandemica. Si bien la OMS ha propuesto numerosas descripciones de gripe pandemica, nunca establecio una definicion formal y los criterios para la declaracion de una pandemia provocada por el virus H1N1 procedian de las definiciones de , no de una definicion de.

El hecho de no contar con una definicion formal de gripe pandemica, a pesar del bagaje de los diez anos de actividades de preparacion contra las pandemias, revela importantes suposiciones subyacentes sobre la naturaleza de esta enfermedad infecciosa. En particular, las limitaciones de los enfoques reclaman una mayor atencion y se debe informar sobre los esfuerzos que se realicen para que dirijan nuestra respuesta ante los futuros brotes de nuevas enfermedades infecciosas.

Pandemic influenza and its definitional implications

Bull World Health Organ, 1 July 2011; 89(7): 539
doi: 10.2471/BLT.11.089078. PMID: 21734770.
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3127277/

In his thoughtful analysis, Doshi aptly describes the need for establishing greater definitional precision of "pandemic influenza" as the basis for future public health preparedness and response efforts.[1] Importantly, his assessment highlights a critical ongoing divide between competing perceptions of the very concept of a "pandemic": namely, between "pandemic" as predominantly a function of geography and virology, versus disease severity.

This is not a minor semantic distinction, but rather one with enormous bearing on planning priorities. For instance, while the United States of America applies an all-hazards approach in its federal, state and local public health emergency readiness efforts, a major piece of 2006 national preparedness legislation was notably called the Pandemic and All-Hazards Preparedness Act.[2] Such explicit separation between "pandemic" and "all-hazards" in the title reflects a unique concern about a pandemic's potential impact and severity, with implications for resource-intensive planning efforts among a myriad of stakeholders. Additionally, milder-than-feared global infectious disease events can subsequently engender a dangerous sense of complacency among frontline responders and the general public, erode trust in public health authorities and potentially reduce compliance with essential protective guidance in the face of future threats.

In keeping with these important considerations, Doshi proposes a more severity-driven approach to the declaration of an influenza pandemic. This strategy has certain merits: research suggests that people are more likely to engage in desired protective behaviours in the face of uncertain risk if they perceive the threat to be legitimately severe and relevant to them (and thus motivating), and if they view the recommended intervention as efficacious.3–5 This would argue for severity as the main definitional predicate for pandemic declaration, rather than geography and virology.

However, a primarily severity-based trigger for pandemic declaration would involve certain operational challenges that must be acknowledged. In the light of wide global variations in public health response infrastructure, population-specific vulnerabilities and the potentially unpredictable course of "pandemic influenza" itself (however defined), "severity" can be experienced very differently in different places and for different community segments at a given point in time.

At the international level, this variability introduces difficulties in yielding standardized severity-governed definitional criteria as the basis for pandemic influenza declaration. Geographic and virologic criteria thus remain more feasible and realistic definitional drivers, despite their admittedly inherent shortcomings from a risk perception standpoint. At the same time, however, severity indices do have considerable utility at national and subnational levels, where the above variations can and should factor directly into tailored, severity-based preparedness and response efforts for pandemic influenza.

In a broader sense, Doshi's assessment speaks powerfully to risk communication as among the greatest challenges in the international response to threats of global public health significance. In the context of pandemic influenza, explicitly establishing a consistent definition is a necessary first step that must be followed by aggressive pre-event education of the global community regarding that definition and its rationale. If we wait to ensure such clarity when the next influenza pandemic strikes, it will simply be too late.

Kelly Heath

The classical definition of a pandemic is not elusive

Bull World Health Organ, 1 July 2011, 89 (7): 540 – 541
http://dx.doi.org/10.2471/BLT.11.088815
https://apps.who.int/iris/handle/10665/270942

Doshi argues cogently that the definition of pandemic influenza in 2009 was elusive but does not refer to the classical epidemiological definition of a pandemic.[1] A pandemic is defined as "an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people".[2] The classical definition includes nothing about population immunity, virology or disease severity. By this definition, pandemics can be said to occur annually in each of the temperate southern and northern hemispheres, given that seasonal epidemics cross international boundaries and affect a large number of people. However, seasonal epidemics are not considered pandemics.

A true influenza pandemic occurs when almost simultaneous transmission takes place worldwide. In the case of pandemic influenza A(H1N1), widespread transmission was documented in both hemispheres between April and September 2009. Transmission occurred early in the influenza season in the temperate southern hemisphere but out of season in the northern hemisphere. This out-of-season transmission is what characterizes an influenza pandemic, as distinct from a pandemic due to another type of virus.

Simultaneous worldwide transmission of influenza is sufficient to define an influenza pandemic and is consistent with the classical definition of "an epidemic occurring worldwide". There is then ample opportunity to further describe the potential range of influenza pandemics in terms of transmissibility and disease severity. The emerging evidence for A(H1N1) is that transmissibility, as estimated by the effective reproduction number (R, or average number of people infected by a single infectious person) ranged from 1.2 to 1.3 for the general population but was around 1.5 in children (Kathryn Glass, Australian National University, personal communication). Some early estimates of R for pandemic influenza H1N1 2009 may have been overestimated.[3]

Severity, as estimated by the case fatality ratio, probably ranged from 0.01 to 0.03%.[4–6] These values are very similar to those normally seen in the case of seasonal influenza.[7,8] However, the number of deaths was higher in younger people, a recognized feature of previous influenza pandemics.[9]

It is tempting to surmise that the complicated pandemic definitions used by the World Health Organization (WHO) and the Centers for Disease Control and Prevention of the United States of America involved severity[1,10] in a deliberate attempt to garner political attention and financial support for pandemic preparedness. As noted by Doshi, the perceived need for this support can be understood given concerns about influenza A(H5N1) and the severe acute respiratory syndrome (SARS). However, conflating spread and severity allowed the suggestion that 2009 A(H1N1) was not a pandemic. It was, in fact, a classical pandemic, only much less severe than many had anticipated or were prepared to acknowledge, even as the evidence accumulated.

In 2009 WHO declared a pandemic several weeks after the criteria for the definition of a classical pandemic had been met. Part of the delay was no doubt related to the nexus between the formal declaration of a pandemic and the manufacture of a pandemic-specific vaccine. If a classical pandemic definition had been used, linking the declaration to vaccine production would have been unnecessary.

This could have been done with a severity index and, depending on the availability and quality of the emerging evidence on severity, a pandemic specific vaccine may have been deemed unnecessary. Alternatively authorities may have decided to order vaccine in much smaller quantities.

The response to A(H1N1) has been justified as being precautionary, but a precautionary response should be rational and proportionate and should have reasonable chances of success. We have argued that the population-based public health responses in Australia and, by implication, elsewhere, were not likely to succeed.[11] Similarly, the authors of the draft report on the response to the International Health Regulations during the 2009 pandemic note that what happened during the pandemic reflected the activity of the virus and, by implication, not the interventions.[10]

Risk is assessed by anticipation of severity and precaution should be calibrated to risk. As Doshi has argued, we need to redefine pandemic influenza. We can then describe the potential severity range of future pandemics. Finally, we need to use evidence to assess severity early to anticipate risk.

Competing interests: None declared.

Living forwards, understanding backwards

Bull World Health Organ, 1 July 2011, 89 (7): 541 – 542
doi: 10.2471/BLT.11.089474. PMID: 21734772; PMCID: PMC3127280
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3127280/

It has been said that pandemics are lived forwards and understood backwards. The 2009 influenza pandemic is no exception. The identification of the new influenza virus strain in the United States of America coincided with many media reports describing a very severe pneumonia affecting young Mexican adults – echoes of 1918! Hard data were sparse and quoted case fatality rates ranged from 0.3% to 2.5% of confirmed cases as late as September 2009. With the benefit of hindsight it is easy to say that the disease caused by the virus was in fact mild for most people and that this action or that action should have been taken. However, in real time with little reliable data on the effects of the virus on individuals and communities and faced with the need to make time-critical decisions, sovereign nations across the world responded differently. It is important to remember that the World Health Organization (WHO) remit is to help governments determine the level of interventions required as part of their response to threats to international health.

Unfortunately, the fact that WHO issued revised pandemic guidance just as the pandemic was starting generated confusion. Under the new guidance,[1] pandemic phases 4 to 6 differed significantly from the 2005 guideline document,[2] and this made communication difficult.

Individuals have made great play of the change to the wording of one sentence that was part of a 60-page document before phase 6 (the so-called start of the pandemic) was declared. In fact, in several places the WHO 2009 guidance document describes phases 5 to 6 as the pandemic period and clearly states that "during phases 5–6 (pandemic) actions shift from preparedness to response at a global level." From this it can be argued that the pandemic was actually declared on 29 April 2009, five days before the quoted change in definition.

In the United Kingdom of Great Britain and Northern Ireland, a new national influenza pandemic strategy was published for consultation on 22 March 2011.[3] This has taken on board many of the lessons learned during the 2009 pandemic. However, the strategy still recognizes the need for an initially precautionary approach, given the speed with which the virus can spread and the paucity of data that will be available at the start of a pandemic, although it states that proportionality and flexibility should guide the response as information about the virus and its effects become available. The strategy is now better adapted to the needs of the United Kingdom and is proposing a new phased response that is not linked to the WHO phases. This reflects the fact that in the United Kingdom the first cases were detected in late April 2009 and that using the WHO phases, which are global indicators of spread, proved to be unhelpful.

Peter Doshi highlights the lack of a definition of a pandemic.[4] There is also no definition of a pandemic wave or severity, both key issues when it comes to describing the progress and impact of a pandemic. I don't believe this reflects a lack of willingness to formulate such definitions, but rather, a lack of international consensus stemming from the absence of key data and the recognition that severity, impact and other descriptors can only be applied with certainty historically.

World Health Organization

Angus Nicoll

Planning for uncertainty:
a European approach to informing responses to the severity of influenza epidemics and pandemics

Bull World Health Organ, 1 July 2011, 89 (7): 542 – 544
doi: 10.2471/BLT.11.089508. PMID: 21734773; PMCID: PMC3127281.
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3127281/

The internationally accepted definition of a pandemic is straightforward and well known: "an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people".[1] However, as Doshi reminds us, for any modern influenza pandemic, with many available powerful countermeasures, it is the detailed description that is crucial in determining proportionate responses, not the definition.[2]

Because of the inherent unpredictability of influenza viruses, preparing for and responding to epidemics and pandemics will always be an uncertain business.[3] Annual epidemics and irregular pandemics have several important characteristics that summary terms such as *mild*, *moderate* and *severe* gloss over.[2] For example, even the "moderate" or "mild" pandemic of 2009 was severe in its impact on many intensive care units and in its initial pressures on primary care services.[4,5]

Data and analyses that inform on the relevant features in the early course of pandemics and epidemics become available continuously. Initial analyses can be misleading and the pattern of infection and disease can also change over time. In the 2009 pandemic, the European Centre for Disease Prevention and Control (ECDC) used updatable published risk assessments to organize this information, comment on its implications for the response and identify the most important areas of uncertainty.[6] This approach was based on a list of "known unknowns" of pandemics, part of a pre-planned "surveillance in a pandemic" strategy.[7]

As recommended by the report adopted by the 64th World Health Assembly,[3] ECDC has further developed this approach applying it as a matrix (Table 1) to annual seasonal epidemics, starting with the 2010–2011 season.

With powerful countermeasures increasingly available – public health interventions, antivirals, vaccines and higher-level intensive care – the matrix relates more to response than to conventional measures, such as transmission and infection fatality rates. Important as these are, they are rarely available in an accurate form early on, whereas the initial impressions of impact on services often appear rapidly.

In the 2009 pandemic, the experience and reports of predominantly mild illness (but with some very severe cases) received from New York City and Melbourne, once verified, were highly informative in determining the proportionate European response.[8] The risk assessments are undertaken by ECDC staff drawing on both European experience (from the European Influenza Surveillance Network) and whatever verifiable epidemic intelligence is available.[9]

For seasonal epidemics the information will be presented visually using internationally recognizable red, amber and green colours (Table 1 and Table 2). Red signals situations in which the evidence suggests action is justifiable, and amber signals those in which precautionary approaches may be needed. Europe has a particular advantage in that seasonal epidemics tend to progress from west to east, so that early experience and virology can be especially helpful in preparing countries for what they will experience later.[10]

Variants on this approach have been used since the 2007–08 season, beginning with the appearance of oseltamivir-resistant viruses in Norway (Table 3) Though concerned with responses, the severity matrix cannot prescribe actions. The ECDC's mandate is to offer scientific information, guidance and options, not to make recommendations. Decisions on risk management are made by its individual Member States and collectively by European Union bodies, such as the Health Security Committee. Capacity, preparation and disease intensity vary across countries; so what can be coped with in one setting may be stressful in another. Hence, the severity matrix will alert Member States as to what *may* give them problems and will suggest options for action.

One of the general lessons learned from the pandemic, as indicated by evaluations undertaken in Europe (listed on the ECDC web site), is that interventions that were not exercised beforehand did not work well. This explains why the ECDC uses interpandemic influenza as a practice ground for pandemic preparation, although it also merits public health action in its own right.[3,11]

Living forwards, understanding backwards (pp 541–542), and Angus Nicoll. Planning for uncertainty: a European approach to informing responses to the severity of influenza epidemics and pandemics (pp 542–544).

This collection of article is intended to clarify the issues that arose, during the 2009 pandemic around definitions of the pandemic term, both in a theoretical and practical way. This Public Health Development from ECDC describes some of the background and complex events in approximately chronological order. In 2009, governments throughout the world mounted responses to the 2009 A(H1N1) pandemic. These efforts were on the premise that pandemic and seasonal influenza potentially required different management and responses.(1) The Director General of the World Health Organization (WHO), followed the actions dictated by the International Health Regulations and acted on the advice of a global emergency committee selected from experts nominated by member states, declared the confirmed outbreak of novel A(H1N1)2009 influenza to be a 'pandemic' in June 2009.(1) As indeed it was according to the long standing definition in the Dictionary of Epidemiology "an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people" .

Later some persons, mostly new to influenza issues, suggested that the declaration of a 'pandemic' was only because WHO had changed its own definition of a pandemic and that this was bowing to commercial pressures.(1) Concern was increased by WHO's decision to withhold publication of the names of its H1N1 advisory Emergency Committee until the pandemic was declared over in August 2010. In response, WHO denied having changed any definitions and defended the scientific validity of its decisions, citing 'numerous safeguards' for handling potential conflicts of interest. Doshi suggests in his article that both parties are partially correct, and to resolve it he proposes a reevaluation of the way in which emerging threats should be defined, taking into account that the simple act of labelling a disease can have enormous social, economic and political implications. Doshi's article indicates how easy it was for people to confuse description with definition of a pandemic. WHO's Pandemic Preparedness homepage had contained statements about how an influenza pandemic could resulting in enormous numbers of deaths and illness and that less informed readers had then assumed that therefore all pandemics would result in such mortality. This process of perhaps over-

stating the risk has been described as risk advocacy by Thomas Abraham.(3) Dr Fineberg, independent chairman of the WHO-appointed International Health Regulations (IHR) Review Committee which evaluated WHO's response to the 2009 influenza A(H1N1) pandemic – identified the 'definition of pandemic influenza' as a critical element in his committee's review.

In the final report of the review released on the 5th May 2011, the Fineberg committee faulted WHO for 'inadequately dispelling confusion about the definition of a pandemic' and noted WHO's 'reluctance to acknowledge its part in allowing misunderstanding'. Doshi also notes that none of the influenza preparedness guidelines - first developed in 1999 and revised in 2005 and 2009 - contain what could be considered a formal WHO definition of a pandemic and that WHO's six-point pandemic phase determinations did not correlate with clinical severity but rather the international spread and the risk of disease occurrence. The Fineberg report recommends that WHO 'develop and apply measures that can be used to assess the severity of every influenza epidemic', while noting that 'assessing severity does not require altering the definition of a pandemic to depend on anything other than the degree of spread' (1). Finally the article by ECDC indicates a way this is being done in Europe.

What is a flu pandemic?

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world.

Outbreaks of influenza in animals, especially when happening simultaneously with annual outbreaks of seasonal influenza in humans, increase the chances of a pandemic, through the merging of animal and human influenza viruses. During the last few years, the world has faced several threats with pandemic potential, making the occurrence of the next pandemic a matter of time.

PANDEMICS

Mary K. Pratt

Pandemics

Edina, Minnesota: ABDO Pub., 2011, p. 16-21
https://archive.org/details/isbn_9781617147760/page/16/mode/1up

What is a Pandemic?

Even doctors, medical institutions, and government health agencies have no single, clear explanation of the word pandemic. “There is a lot of misinformation in the medical literature, and it is really quite hard to figure out what is and what is not a pandemic,” said Dr. David M. Morens, an epidemiologist at the National Institute of Allergy and Infectious Diseases.

In general, a pandemic is declared when many people in several different regions of the world have the same disease around the same time. A pandemic is a larger version of an epidemic, which happens when a communicable disease sickens many people around the same time in a small area. An epidemic that spreads around a large part of the world or sickens a high percentage of the population is a pandemic.

However, a disease does not have to be present in every country – or even most countries – to be considered a pandemic. The disease does not even have to be particularly deadly, either.

Controversy over definition

It is important that the definition created by the WHO be accurate because it affects how governments, institutions, health officials, and the public react to an outbreak.

The WHO uses a six-point system, which was created in 2005, to alert governments around the world to the severity of a potential pandemic. The system describes how widespread an infectious disease has become. In Phase 1, the disease being monitored occurs only in animals, and humans are not affected. As humans become infected and the disease becomes more widespread, it becomes a greater threat. By Phase 6, the disease has caused outbreaks in several countries and in multiple regions of the world. It has become a pandemic disease.

But some criticized WHO's definition of an influenza pandemic as too broad. According to Dr. Peter Gross, an infectious disease specialist at the Hackensack University Medical Center in New Jersey, under the WHO definition, some seasonal influenza viruses could be incorrectly classified as pandemics. Seasonal influenza occurs every year. Although the strain changes each year, medical professionals are prepared for the disease, and vaccines are ready in advance to prevent infection.

Also, WHO's system does not take into account the potential mortality rate of the pandemic disease. Because the H1N1 virus was less deadly than other pandemic diseases, some governments believed WHO's system created unnecessary panic. Many people believed the H1N1 virus was incredibly dangerous. Some parents were afraid to send their children to school. Others were demanding that avaccine be prepared immediately. Many governments believe that the severity of the illness should be considered, not just how widespread the infection is.

Redefining Panpemic

As the H1N1 virus spread throughout 2009, 'WHO officials found it necessary to revisit how they defined an influenza pandemic. For many years, the WHO defined an influenza pandemic simply as causing "enormous numbers of deaths and illness." But according to its Web site at the end of 2009,

a pandemic is a worldwide epidemic of a disease. An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity. . . . Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic.

It is important for the WHO to have an accurate and effective definition of a pandemic. The WHO is considered an authority on global health issues. Its recommendations shape the response of local governments in fighting outbreaks of disease. Governments and health officials must react quickly if they are to control a potential threat to public health. They must research treatments, procure medicine, train medical personnel about the disease, and design systems for responding to local outbreaks. If the pandemic illness is potentially deadly, the response will need to be even more aggressive.

Epidemiology
An Introduction

Kenneth J. Rothman

Epidemiology: an Introduction

2nd ed, New York, NY: Oxford University Press, 2012, p. 112.

What Makes a Pandemic?

In Chapter 4, an epidemic was defined as an unusually high occurrence of disease. A *pandemic* is defined in the *Dictionary of Epidemiology*[2] as "an epidemic occurring worldwide or over a very wide area, crossing boundaries of several countries and usually affecting a large number of people."

The World Health Organization (WHO) had a more specific description that it had used for *pandemic influenza*: An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide *with enormous numbers of deaths and illness*."

Just before WHO announced that the H1N1 influenza of 2009 (swine flu) had become pandemic, it changed its descrip-tion of pandemic by dropping the phrase "with enormous numbers of deaths and illness."

This new description of pandemic was mom consistent with the definition quoted from the Dictionary of Epidennology.2 It also allowed the WHO to declare a pandemic for a disease that did not have extraordinary mortality and morbidity.

The announcement of the pandemic in 2009 led to criticism that the declaration was motivated by ties between the WHO and the phamaaceutical industry, a claim that the WHO denied?'

Jacqueline Langwith, Editor

Pandemics:
The WHO Wanted a Pandemic

Detroit, New York, San Francisco, etc., Greenhaven Press, 2012, p. 74-75.

The WHO Wanted a Pandemic

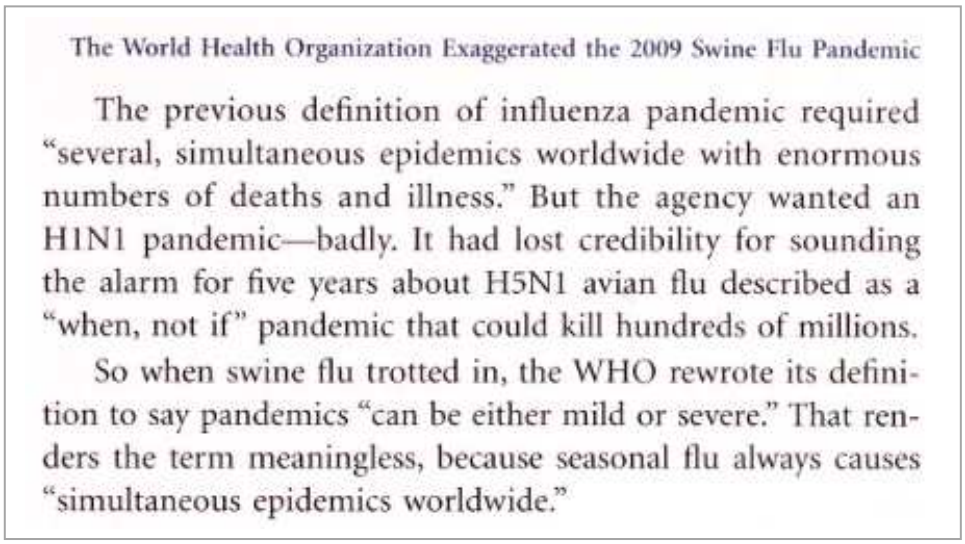
In fact, there was never a need for luck or alarm. Just two days after Fukuda's Spanish flu comparison. I wrote of a "porcine panic" I we on to ffiterate in any more articles that flu fears were being overblown: When the WHO made the pandemic official, for example, I noted that swine flu had killed only 144 people worldwide in 11 weeks, fewer than die e*ach day* from ordinary flu. If I knew the outbreak was being exaggerated, than the WHO and others knew or should have known.

The previous definition of influenza pandemic required "several, simultaneous epidemics worldwide with enormous numbers of deaths and illness" But the agency wanted an HINT pandemic – badly. It had lost credibility for sounding the alarm for five years about HSNI avian flu described as a "when, not if pandemic that could kill hundreds of millions.

So when swine flu trotted in, the WHO rewrote its definiion to say pandemics "can be either mild or severe." That renders the term meaninglew, because seasonal flu always causes "simultaneous epidemics worldwide."

This gave license to others to treat swine flu as a pandemic in the commonly accepted sense of the term. Thu, last August [2009], the President's Council of Advisors on Science and Technology forecast a "plausible" scenario of 30,000 to 90,000 U.S. deaths. In the *Washington Post*, author John Barry predicted more than 89,000 American deaths.

This was obviously nonsense. We already had information from all over the world showing swine flu to be vastly milder than the seasonal variety. A New York City estimate suggested that seasonal flu was 10 to 40 times deadlier than swine flu. In Australia, with the epidemic already well under may and no vaccine generally available, people were dying at a lower rate than nomul.



The World Health Organization Exaggerated the 2009 Swine Flu Pandemic

The previous definition of influenza pandemic required "several, simultaneous epidemics worldwide with enormous numbers of deaths and illness." But the agency wanted an H1N1 pandemic—badly. It had lost credibility for sounding the alarm for five years about H5N1 avian flu described as a "when, not if" pandemic that could kill hundreds of millions.

So when swine flu trotted in, the WHO rewrote its definition to say pandemics "can be either mild or severe." That renders the term meaningless, because seasonal flu always causes "simultaneous epidemics worldwide."

Søren Ventegodt

Why the Corruption of the World Health Organization (WHO) is the Biggest Threat to the World's Public Health of Our Time

J Integrative Med Ther. January 2015, 2(1): 1-5
https://www.avensonline.org/fulltextarticles/JIMT-2378-1343-02-0004.html

Abstract

In the scientific community it is generally accepted that metaanalyses are more accurate than single studies and independent studies more trustworthy than industrial studies. It is therefore understandable that Cochrane reviews, meta-analyses based on rigid protocol and independent origin, have the highest quality in medical research. It is therefore unfortunate that Cochrane reviews seems systematically to conflict with the information and recommendations from the World Health Organization (WHO).

A number of the drugs and vaccines recommended by WHO, especially the drugs used in psychiatry, are in Cochrane reviews found to be harmful and without significant clinical effect. Since whose recommendations are followed by many people in the member states, it could indeed lead to patients getting the wrong medication and many patients have severe adverse effects, because of these drugs.

To solve this serious public health problem it is recommended to revise the WHO-system, which in fact has been proven weak to the interests of the pharmaceutical industry. We therefore believe that the WHO's recommendations regarding medicine in its "list of essential medicines" and other drug directories are biased and not reliable as a source of information on medicine

...

Many drugs listed in the WHO drug directories, like "WHOs model list of essential medicines" [6], have no value as medicine according to Cochrane reviews, since the drugs are dangerous, often harmful, and without significant beneficial effects for the patient. You can even say that the lack of effect and the danger of the drugs are well documented!

...

It turned out to be a false alarm and the Swine Flu epidemic in 2009 did not cause the many cases of deaths as first expected [12,13,15-25]. Slowly it became known that the WHO actually knew this already BEFORE the director-general Margaret Chan declared the pandemic. This can be seen by the fact that WHO changed the definition of a "pandemic" from meaning "millions of deaths" to mean a non-dangerous infection that spreads worldwide only one month before the WHO's declaration of the pandemic [1,2,14-25,28,29].

L'OBS

Gérard Bapt

Grippe A: comment l'OMS a dramatisé les effets de la pandémie

L'OBS, 10 novembre 2016 à 10h34
https://www.nouvelobs.com/rue89/rue89-nos-vies-connectees/20100603.RUE6852/grippe-a-comment-l-oms-a-dramatise-les-effets-de-la-pandemie.html

7,4 millions de décès annoncés. 18 114 dénombrés, au final, depuis avril 2009. Alors que l'Organisation mondiale de la santé (OMS) s'apprête à lever l'alerte sur la grippe A, sa gestion de la pandémie est attaquée. Et pour cause: en retirant le critère de mortalité du phasage de la mise en œuvre de sa stratégie de gestion face à tout virus nouveau, l'OMS nous condamne à l'«alerte sanitaire mondiale» à perpétuité.

Comment l'Organisation mondiale de la santé a-t-elle élaboré sa stratégie de réponse aux pandémies grippales que l'on observe depuis près d'un siècle ? Sur quelle définition précise et reconnue de l'épidémie à combattre ?

En modifiant sa définition d'une «pandémie de grippe»

En surfant sur le site de l'OMS, j'ai remarqué que l'organisation avait changé sa définition de la notion de pandémie virale.

Avant le 4 mai 2009, la définition d'une pandémie virale était la suivante:
«Une pandémie de grippe se produit lorsque apparaît un nouveau sous-type de virus dont personne n'est à l'abri. Plusieurs épidémies peuvent se déclarer simultanément dans le monde, provoquant un grand nombre de cas et de décès».

Le site renvoie à la «check-list» qui précise des recommandations aux Etats et dit notamment que: «même dans l'hypothèse la plus modérée, on dénombrera quelques 7,4 millions de décès dans le monde, dans un laps de temps très bref...».

En déclenchant l'alerte maximale très tôt

Après le 4 mai 2009, sur le même site, les notions de morbidité et de mortalité ont disparu. Le 11 juin, Margaret Chan, directrice général de l'OMS déclenche la phase 6 de la pandémie grippale, la plus haute, alors que 144 décès sont attribués à la grippe A dans le monde.

Cette déclaration n'aurait pu être faite sans ce changement de définition, excluant la prise en considération de la mortalité. Le Center of Disease Control américain estimait dès le 23 avril 2009 que ce virus ferait beaucoup moins de morts qu'une grippe saisonnière.

Mais les mêmes prévisions en nombre de morts apparaissent toujours dans la «check-list» des recommandations aux Etats, ainsi déconnectée de la définition de la pandémie et entretenant le catastrophisme.

En changeant les règles de l'expertise du virus

Le 24 avril 2009, jour de « l'alerte sanitaire mondiale » proclamée par l'OMS, quinze cas de grippe étaient attribués au H1N1 type A. Richard Besser, le directeur du Center of Disease Control déclarait:
=> https://www.cdc.gov/media/transcripts/2009/t090424.htm

«Nous allons expertiser le nouveau virus selon trois dimensions: Est-il nouveau pour la population? Cause-t-il des affect ions sévères? Est-il aisément transmissible?»

Las, quelques jours plus tard, le 4 mai, les bases sur lesquelles l'expertise devait être conduite allaient être bouleversées: la notion de sévérité de la pandémie disparaissait de la définition officielle de la pandémie. On venait de changer les règles du jeu en cours de partie!

C'est au bout d'une longue maturation que l'OMS en est arrivée à ce changement, prenant prétexte du nouveau règlement sanitaire international. Les efforts des firmes productrices de vaccins et de certains experts n'y ont toutefois pas manqué !

En partant des prévisions les plus graves...

En témoigne l'examen des comptes rendus de la réunion regroupant OMS, agences et firmes à Genève les 11 et 12 novembre 2004, de même, celui de l'assemblée de l'ESWI (European Scientists Fighting Influenza), présidée par le très contesté Professeur Osterhaus, réunie en janvier 2009 à Bruxelles.

A partir de mai 2009, l'OMS continue à renvoyer à des recommandations faisant appel à des prévisions évoquant 7,4 millions de décès. Ces prévisions seront relayées dans les différents pays : en France, le Professeur Flahaut affiche, le 12 mai 2009, la « prévision modérée » de 30000 décès.

Beaucoup plus tard, le très officiel Institut de Veille Sanitaire (INVS) livre dans son avis du 28 septembre 2009 des fourchettes d'évaluation actualisées, allant de 6400 décès dans le scénario le plus optimiste, à 96 000 décès dans le plus pessimiste, avec 640 à 4800 décès pour les enfants de 0 à 4 ans...

Malgré les données du terrain

A cette date étaient pourtant connues de nombreuses données provenant de pays ayant connu le pic pandémique de grippe A. On dénombrait ainsi le 26 août 439 décès en Argentine, 128 au Chili, 34 en Uruguay, 132 en Australie, 522 aux USA... beaucoup moins que pour une grippe saisonnière !

Le caractère modéré («mild») de la pandémie était souligné, de même que les publics vulnérables désignés (femmes enceintes, pathologies associées...).

Certains experts et chercheurs (par exemple du très prestigieux Massachussets Institute of Technology) avaient aussi indiqué que des prévisions trop pessimistes sur une pandémie avaient un grand impact sur l'expérience sociale en matière de santé publique.

Des stratégies de réponse aux pandémies uniquement basées sur des prévisions catastrophistes ne peuvent qu'éroder la confiance des populations et des professionnels de santé, d'autant plus que la communication publique y contribue fortement.

Thierry Saussez, responsable de la communication gouvernementale, n'a-t-il pas indiqué devant la commission d'enquête de l'Assemblée nationale que, face à une menace, il fallait partir des prévisions les plus graves ? L'INVS les a formulées !

...

Так действительно ли это пандемия – нечто, чего стоит бояться?

На ум приходит поддельная пандемия свиного гриппа H1N1 в 2009 году. ВОЗ изменила определение термина ‘пандемия’ за месяц до объявления пандемии гриппа H1N1.

Определение ВОЗ до внесения изменений гласило: “Пандемия гриппа возникает, когда появляется новый вирус гриппа, против которого человеческое население не имеет иммунитета, что приводит к нескольким одновременным эпидемиям во всем мире *с огромным числом смертей и болезней*”.

За месяц до объявления H1N1 пандемией определение ВОЗ было изменено на следующее: “Пандемия гриппа может произойти, когда появляется новый вирус гриппа, против которого человеческое население не имеет иммунитета”.

Статья ВОЗ продолжает: “Несколько месяцев спустя Совет Европы будет ссылаться на это изменение как на доказательство того, что ВОЗ изменила свое определение пандемии гриппа, чтобы можно было объявить пандемию без необходимости демонстрации интенсивности заболевания, вызванного вирусом H1N1″.[27]

Поддельная пандемия не означает поддельный вирус, но это означает, что все меры по борьбе с чем-то не более опасным, чем сезонный грипп, несоразмерны. На ум приходят также спящие контракты с фармацевтическими компаниями.

Возможно, стоит задуматься, сколько денег могут заработать фармацевтические компании, сколько на этом могут заработать их спонсоры, такие как Фонд Билла и Мелинды Гейтс? И к каким крайним мерам они могли подтолкнуть правительства для достижения своих целей? Каждому человеку на планете сделать прививку? Билл Гейтс сам сказал: “Пока мы не вакцинируем всех во всем мире, мы не сможем вернуться к нормальному состоянию”.[28]

Историко-эпидемиологические события, предшествовавшие и сопровождавшие изменения в описании пандемии на веб-сайте ВОЗ

May 2024; DOI: 10.13140/RG.2.2.33031.82088
https://www.researchgate.net/publication/380365936_Istoriko-epidemiologiceskie_sobytia_predsestvovavsie_i_soprovozdavsie_izmenenia_v_opisanii_pandemii_na_veb-sajte_VOZ

Краткое содержание

Данное исследование было проведено с целью выявления исторических и эпидемиологических событий, которые предшествовали изменениям определения пандемии, произошедшим на сайте ВОЗ в 2009 и 2011 годах.

В связи с тем, что причина изменения определения пандемии была неизвестна, поэтому возникла необходимость провести анализ литературы, посвященной эпидемиям и пандемиям, а также документов ВОЗ, веб-сайта ВОЗ, и статей, опубликованных в печатных изданиях и в Интернете.

До четвертого мая 2009 года, при описании пандемии основное внимание уделялось «большому числу случаев заболевания и смертей». Шестого мая 2009 года было опубликовано новое описание пандемии, в котором основное внимание уделялось распространенности заболевания. В 2011 году описание пандемии на веб-сайте ВОЗ было возвращено к первоначальному варианту без какихлибо комментариев.

...

В результате проведенного исследования выявлена следующая последовательность событий:

2003-2009: Нарастающая, но затем снижающаяся угроза развития пандемии птичьего гриппа;

2004-2009: Разработка и производство вакцин от виртуального пандемического штамма вируса птичьего гриппа;

2009, Январь: Австрийская компания Baxter разослала «вакцины», содержавшие живой вирус птичьего гриппа;

Апрель, 8: В прокуратуру города Вены подан иск против австрийского филиала компании Baxter и против компании Avir Green Hills Biotechnology;

Апрель, 14: CDC: Американский Центр по контролю и профилактике заболеваний (CDC) сообщил о выявлении первого случая лихорадочного заболевания на территории США, вызванного новым штаммом свиного гриппа

Апрель, 29: ВОЗ: Уровень предупреждения о пандемии гриппа повышен с 4-й фазы до 5-й;

Май, 2: Министр здравоохранения Мексики, заявил, что, эпидемия идет на спад, и, вероятно, на следующей неделе страна вернется к обычной жизни;

Май, 4: ВОЗ: Во время пресс-конференции, *Натали Буду, заявила*, что *определение пандемии* на веб-сайте ВОЗ, где пандемия гриппа характеризовалась «большим числом случаев заболевания и смертей», *было ошибочным*... и оно будет исправлено;

Май, 6: На веб-сайте ВОЗ появилось новое определение пандемии;

2011, Июль-Август: На веб-сайте ВОЗ определение пандемии *вернулось к первоначальному варианту* с акцентом на высокую заболеваемость и смертность.

«В течение многих лет на веб-сайте ВОЗ, пандемия гриппа определялась,
как причина 'большого числа случаев заболевания и смертей'.
Но недавно агентство отозвало это определение, извинившись за то,
что оно вызвало замешательство и беспокойство ... ».
[*The New York Times*, 8 июня 2009]

Краткое содержание

Данное исследование было проведено с целью выявления исторических и эпидемиологических событий, которые предшествовали изменениям определения пандемии, произошедшим на сайте ВОЗ в 2009 и 2011 годах.

В связи с тем, что причина изменения определения пандемии была неизвестна, поэтому возникла необходимость провести анализ литературы, посвященной эпидемиям и пандемиям, а также документов ВОЗ, веб-сайта ВОЗ, и статей, опубликованных в печатных изданиях и в Интернете.

До четвертого мая 2009 года, при описании пандемии основное внимание уделялось «*большому числу случаев заболевания и смертей*». Шестого мая 2009 года было опубликовано новое описание пандемии, в котором основное внимание уделялось распространенности заболевания. В 2011 году описание пандемии на веб-сайте ВОЗ было возвращено к первоначальному варианту без каких-либо комментариев.

Если ориентироваться на документы ВОЗ, опубликованные в 2009 году, то объявление пандемии свиного гриппа в июне 2009 года было оправданным. Однако, учитывая историю предыдущих пандемий, здравый смысл и последствия объявления пандемии при заболевании, не сопровождающимся большим числом случаев и высокой смертностью, объявление пандемии было преждевременным.

Поскольку основным фактором, препятствующим развитию пандемии, является эффективное лечение нового инфекционного заболевания, поэтому, для минимизации вероятности возникновения новой пандемии в будущем, необходимо повысить качество специального медицинского образования, а также изучить и адаптировать к современным условиям все эффективные методы и лекарственные препараты, использовавшиеся для лечения инфекционных заболеваний в прошлом.

Abstract

The study was carried out to evaluate historical and epidemiological events that preceded and accompanied the adjustment of the description of a pandemic on the WHO website in 2009 and 2011.

Since the cause of the change in the description of a pandemic on the WHO website is not clear, analyses of the literature related to the epidemics and pandemics, WHO documents, WHO website, and articles published in journals and the Internet have been done.

Until early May 2009, the description of the pandemic focused on "enormous numbers of cases and deaths." On May 6, 2009, a new description of the pandemic was published, focusing on the prevalence of the disease; in 2011 it reverted to the initial one without any comments. From the perspective of the WHO document issued in 2009, the declaration of a swine flu pandemic in June 2009 seemed justified. However, considering the previous pandemic history, common sense, and the consequences of declaring a pandemic for a disease not accompanied by a high number of cases and high mortality, it was a premature move.

Since the primary factor hindering the development of a pandemic is the effectiveness of treating infectious disease, to minimize the likelihood of a new pandemic, it is necessary to improve the quality of special medical education and to study and adapt to modern conditions all effective drugs and methods used in the past.

Ключевые слова: пандемия, эпидемия, свиной грипп, pandemic, epidemic, swine flu, WHO, H1N1,

1. Предпосылки

При анализе страниц веб-сайта ВОЗ, посвященных пандемии гриппа, выявлены изменения в использовании термина «пандемия», произошедшие в 2009-2011 годах. Некоторые изменения были отражены в документах ВОЗ и в средствах массовой информации, другие изменения остались незамеченными.

2. Цель исследования

Целью данного исследования является выявление исторических и эпидемиологических событий, предшествовавших и сопровождавших изменения в определении пандемии на веб-сайте ВОЗ.

3. Материалы и методы исследования

При проведении данного исследования использовалась литература, посвященная эпидемиям и пандемиям, документы ВОЗ, страницы веб-сайта ВОЗ, а также статьи, опубликованные в журналах и на веб-сайтах различных Интернет изданий.

Для оптимизации данного исследования, страницы веб-сайта ВОЗ, посвященные описанию пандемии, были собраны в тематический сборник, содержащий текст и копии страниц.[1]

4. Введение

Инфекционные заболевания, а также эпидемии, были хорошо известны с древних времен. В китайском *Каноне о Внутреннем*, предположительно датируемым десятым веком до н.э., описаны внешние патогены, которые могут вызвать острые заболевания и способны поразить большòе число людей одновременно. Прогноз относительно возникновения таких заболеваний можно было составить, наблюдая погоду в первые дни китайского нового года.[2]

Уже в те времена врачи знали, что протекание заболевания в каждом конкретном случае зависит от исходного состояния пациента, и его «защитной энергии» (*Wei Qi*).[3] Под «защитной энергией» можно подразумевать комплексный ответ иммунной системы, а также других систем организма, вовлеченных в патогенетические и саногенетические реакции больного.

Несмотря на многообразие внешних патогенов, представленных тысячами вирусов и бактерий, организм человека обладает ограниченным набором защитных реакций, которые в современной патофизиологии известны, как *воспаление*, *лихорадка*, *гипоксия*, *общий адаптационный синдром*, и пр. Эти патогенетические синдромы сопровождаются неспецифическими симптомами, такими как повышение температуры, слабость, озноб или ощущение жара, головная боль, кашель, одышка, тошнота, рвота, понос, кожная сыпь, изменение цвета кожи, и т.д., которые имеют схожий патогенез, независимо от возбудителя инфекционного заболевания.

При широкой вариабильности патогенов, в случае развития любого лихорадочного заболевания, участвуют только два ведущих механизма, приводящих к повышению температуры – это увеличение теплопродукции или снижение теплоотдачи.[4] Аналогичным образом можно найти 2-3 механизма, участвующих в формировании каждого клинического синдрома.

Около 1800 лет назад д-р *Чжан Чжунцзин* изучил результаты исследований предыдущих поколений и разработал теорию острых инфекционных заболеваний, которая объясняла диагностику и лечение ведущих синдромов. Согласно этой теории, в случае развития острого заболевания, происходит смена нескольких фаз инфекционного процесса, от 1-й до 6-й, отражающих постепенное включение различных уровней защиты. Каждая фаза может протекать по одному из двух или трех вариантов. Таким образом, всё разнообразие клинических синдромов, связанных с любым острыми инфекционным заболеванием, можно свести к 10-12 вариантам, для каждого из которых был разработан протокол этиопатогенетического лечения.[5] При изменении симптомов и, соответственно, при изменении клинического синдрома, необходимо подобрать новое лечение. Поэтому при лечении каждого пациента протокол использования лекарственных средств постоянно менялся в соответствии с изменениями основных симптомов заболевания.

Приведем несколько примеров из рецептуры, предложенной доктором Чжаном: в начале лихорадки с ощущением холода без потоотделения рекомендуется использовать отвар из травы эфедры (*Herba Ephedrae*); если в начале лихорадки имеется ощущение жара – используется отвар из листьев белой шелковицы (*Folium Mori Albae*) и мяты (*Herba Menthae Haplocalycis*); в начале лихорадки с интенсивным потоотделением, но без ощущения жара – отвар из веточек коричного дерева (*Ramulus Cinnamomi Cassiae*); при наличии лихорадки с чередованием ощущения жара и холода, или озноба – отвар из корней володушки (*Radix Bupleuri*). Если лихорадочное заболевание прогрессирует и появляется кожная сыпь, геморрагический синдром, делирий, и прочие осложнения, то используется отвар из корней вайды красильной (*Radix Isatis tinctoria*).[6]

В последующие века протоколы лечения инфекционных заболеваний обновлялись в соответствии с новым пониманием этиологии и патогенеза заболеваний, а также достижениями фармакологии.

Современный врач, изучавший общий адаптационный синдром Ганса Селье,[7] к сожалению, знаком лишь с ограниченной версией теории острых инфекционных заболеваний доктора Чжана и не обладает достаточными знаниями для ее применения у постели больного.

1.	*Tai Yang*	- Простудные симптомы
2.	*Shao Yang*	- Переходная фаза: жар ~ озноб
3.	*Yang Ming*	- Прогрессирующая лихорадка
4.	*Tai Yin*	- Начальная фаза истощения защиты
5.	*Shao Yin*	- Стойкая высокая лихорадка, геморрагический синдром и прочие осложнения
6.	*Jue Yin*	

Рис. 1. Шесть фаз развития острого инфекционного заболевания

Можно предположить, что развитие эпидемии или пандемии зависит не столько от опасности внешнего патогена, сколько от *знаний* и *опыта* врача и от его *способности* подобрать индивидуальное лечение, соответствующее теку-

щей фазе острого заболевания. Поэтому подготовка врача, умеющего использовать эффективные средства и методы лечения, должна быть в основе успешной борьбы с будущими эпидемиями. В противном случае, нас ожидает череда пандемий, напоминающих те, которые произошли в 2009-2010 и 2020-2023 годах, когда основная надежда была возложена на карантин, ограничение передвижения и массовую вакцинацию.

5. Краткий обзор определения пандемии до 1999 года

В словаре, изданном в Лондоне в 1791 году, термин эпидемия (*epidemius*) относился к заболеванию, которое одновременно поражает множество людей, а затем исчезает. В том же словаре слово пандемия (*pandemius*) трактуется как синоним слова эпидемия.[8]

В энциклопедическом словаре, изданном в России в 1847 году, имеется следующее определение эпидемии: «*Эпидемія*. – Такъ называется всякая болѣзнь, происходящая отъ особаго свойства воздуха, способствующаго развитію, упорности и особой злокачественности болѣзни, и поражающая одновременно множество людей; таковы холера, тиф и другія болѣе или менѣе острыя или злокачественныя болѣзни».[9] Термин «пандемия» в словаре отсутствовал.

В словаре, изданном в Филадельфии, в 1874 году, термин «эпидемия» [греч. ἐπί - *epi*, означает - «на», + δῆμος - *dēmos*, означает «народ»] использовался для описания заболевания, при котором одновременно поражено большое число людей определенной страны или региона. Термин «пандемия» [греч. παν - *pan*, означает - «все» или «всё», + δῆμος - *dēmos*, означает «народ»] означал заболевание, которым было охвачено большинство или все население страны.[10]

В энциклопедическом словаре, изданном в России в 1904 году, под *эпидемией* подразумевается такое заболевание, которое возникает где-либо, время от времени, и затем распространяется на большие территории, поражая многих людей, а, прекратившись, исчезает на долгое время. При одновременном распространении болезни на все население земного шара или при поражении большинства людей на более ограниченной территории говорят о *пандемии*.[11]

В конце 20-го века смысл термина «*эпидемия*» приобрел более широкое значение и стал применяться к необычному увеличению числа случаев определенного заболевания, как инфекционной, так и неинфекционной природы. В это же время, термин «*пандемия*» стал использоваться при описании вспышки таких заболеваний, как чума, холера или грипп.[12]

Обсуждение противоречий между необходимостью и правомерностью использования термина «*пандемия*» началось в начале мая 2009 года,[13] т.е. примерно за месяц до 11 июня, когда Генеральный директор Всемирной Организации Здравоохранения (ВОЗ), д-р Маргарет Чан (*Chan*) заявила: «*Сейчас мир находится в начале пандемии гриппа* 2009 *года*».[14] С момента объявления пандемии вступили в силу контракты, заключенные между правительствами различных стран и фармакологическими компаниями, поставляющими противовирусные препараты и вакцины.[15]

6. Определение термина «*пандемия*» в документах ВОЗ, изданных в 1999-2017 годах

В 1999 году ВОЗ разработала документ – *План подготовки к пандемии гриппа.* В нем приводятся ссылки на пандемии гриппа, произошедшие в 1918, 1957 и 1968 годах, а также дано подробное описание периодов развития пандемии, включая межпандемический период, период предупреждения о пандемии (три уровня), и пандемический период (четыре фазы), по окончанию которого вновь наступал межпандемический период.[16]

В документе 1999 года не было определения, что такое *пандемия*, но было дано разъяснение, что «*Пандемия* будет объявлена, если будет доказано, что новый подтип вируса вызвал несколько вспышек, по крайней мере в одной стране и распространился на другие страны. При этом характерные признаки заболевания указывают на то, что *высокая заболеваемость и смертность* (serious morbidity and mortality) вероятны, по крайней мере, в одном сегменте населения».[16]

В связи с возникновением спорадических случаев птичьего гриппа, в 2004 году был издан новый документ, где дано следующее описание возникновения пандемии:

«*Пандемия* гриппа возникает с появлением нового вируса гриппа, против которого никто из населения не имеет какого-либо иммунитета. Это приводит к нескольким одновременным эпидемиям с *большим числом случаев заболевания и смертей*. В связи с глобальным развитием транспорта и коммуникаций, а также с урбанизацией и перенаселенностью, эпидемии, вызванные новым вирусом гриппа, могут быстро распространиться на весь мир».[17] Таким образом, главный критерий пандемии – *большое число заболевших и смертей* – остался неизменным.

Ниже приведены описания пандемии, представленные в документах ВОЗ в последующие годы, позволяющие предположить, что характеристики пандемии оставались прежними. Например,

«*Пандемия гриппа* связана с высокой заболеваемостью, повышенной смертностью и социальными и экономическими потрясениями» (январь 2005 г.).[18]

«*Пандемия гриппа* (мировые эпидемии) происходила через нерегулярные и непредсказуемые промежутки времени и была связана со значительной заболеваемостью, смертностью и экономическими издержками» (март 2005 г.).[19]

«*Пандемия гриппа* (или глобальная эпидемия) возникает, когда появляется новый подтип вируса гриппа, от которого нет иммунитета. Это может привести к нескольким одновременным эпидемиям во всем мире с *большим числом случаев заболевания и смертности*. В связи с глобальным развитием транспорта и урбанизацией, эпидемии, вызванные новым вирусом гриппа, могут быстро распространиться по всему миру» (весна 2005 г.).[20]

«*Пандемия гриппа* (мировые эпидемии) ... характеризуется *высокой заболеваемостью*, *смертностью* и экономическими издержками (октябрь 2005 г.).[21]

Кроме того, в документах ВОЗ подчеркивалось, что пандемический вирус может привести к нескольким одновременным эпидемиям во всем мире, вызывая большое число случаев и смертей (*high numbers of cases and deaths*), [19] или, к значительной заболеваемости и смертности (*considerable morbidity and mortality*).[22]

An influenza pandemic

An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with high numbers of cases and deaths. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world.

Рис. 2. WHO checklist for influenza pandemic preparedness planning WHO/CDS/CSR/GIP/2005.4. – Geneva, WHO, p. vi (2005).[20]
В русском варианте документа этого параграфа нет.[23]

В марте 2005 года ВОЗ подготовила еще один документ – «*Глобальный план ВОЗ по обеспечению готовности к гриппу*», в котором, как и в предыдущих документах, говорилось, что пандемический вирус может вызвать значительную заболеваемость и смертность во всех возрастных группах. В новом документе упоминаются пандемии гриппа 1918, 1957 и 1968 годов, унесшие миллионы жизней. В нем также представлено подробное описание шести фаз развития пандемии, каждая из которых характеризовалась повышенной и устойчивой передачей вируса среди населения в целом.[24]

Первой задачей руководства ВОЗ во время пандемии (фаза 6) была «*минимизация заболеваемости и смертности*», связанных с текущими инфекциями среди людей.[24] Таким образом, пандемия по-прежнему характеризовалась *высокой заболеваемостью и смертностью*; в противном случае не было бы смысла снижать эти параметры.

Новый документ ВОЗ – «*Обеспечение готовности к пандемии гриппа*» – был завершен и опубликован весной 2009 года.[25] Согласно результата поиска в «google search», проводимого в 2023 году, при подготовке *Сборника...*[1] новое издание было опубликовано 26 апреля 2009 г., (рис. 3), т.е. на следующий день после первого заседания Комитета по чрезвычайным ситуациям, созванного Генеральным директором ВОЗ для решения проблемы вспышки свиного гриппа.[26]

Pandemic Influenza Preparedness And Response

3 Mar 2009 — **Pandemic Influenza Preparedness And Response**. WHO guidance document. 3 March 2009.

Рис 4. "Pandemic Influenza Preparedness and Response".

Как и в предыдущем аналогичном документе, опубликованном в 2005 году, в новом издании упоминаются пандемии гриппа 1918, 1957 и 1968 годов, унесшие миллионы жизней; однако встречаемость слов «*смерть*» или «*смертность*» в новом документе сократилось вдвое.

В новой редакции документа сохранено шестифазное развитие пандемии. Критериями для 6-й фазы являются следующие признаки: «В дополнение к критериям, определенным для фазы 5, один и тот же вирус вызывает постоянное заражение населения на уровне общин, по крайней мере, еще в одной стране в другом регионе ВОЗ».[25]

Определение «пандемии» отсутствовало; различные фазы готовности к пандемии различались лишь по распространенности инфекции без учета тяжести течения заболевания и смертности. Согласно новому документу, ВОЗ не брала на себя никаких обязательств по минимизации заболеваемости и смертности, как это было в документе, выпущенном в 2005 году. Новый документ использовался как руководство для объявления пандемии свиного гриппа 11 июня 2009 года.[14]

В документе, выпущенном ВОЗ в 2017 году – «*Руководств ВОЗ по обеспечению готовности* контролирующих органов к выдаче разрешения на реализацию вакцин ... », вновь упоминалось, что пандемический вирус может вызвать одновременно несколько эпидемий по всему миру с *большим числом случаев заболевания и смертей*.[27]

7. Определение термина «*пандемия*» на веб-сайте ВОЗ перед 4 мая 2009 года

В 2003-2005 годах раздел, посвященный инфекционным заболеваниям, был озаглавлен «*Эпидемиологический надзор* за инфекционными заболеваниями и реагирование в случае их возникновения».[28] Во второй половине октября 2005 г. эта страница получила новое название «*Оповещение* об эпидемиях и пандемиях и ответные действия (EPR)».[29] 10 июля 2009 года, страница сайта ВОЗ, посвященная инфекционным заболеваниям, получила название «*Глобальное предупреждение* и ответные действия (GAR)».[30]

На веб-сайте ВОЗ, первое доступное определение пандемии датируется вторым февраля 2003 года, в частности, там написано: «*Пандемия гриппа*: Пандемия гриппа возникает, когда появляется новый вирус гриппа, против которого человеческое население не имеет иммунитета, что приводит к нескольким одновременным эпидемиям во всем мире с *большим числом случаев заболевания и смерти*», (рис. 5) и далее: «В условиях увеличения масштабов перевозок на глобальном уровне, а также урбанизации и перенаселенности в некоторых районах, эпидемия, вы-

званная каким-либо новым вирусом гриппа, может распространиться во всем мире и превратиться в пандемию быстрее, чем это наблюдалось ранее».[28]

Во второй половине июня 2004 года, на сайте ВОЗ появилось дополнение: «*Вспышки гриппа* среди животных, особенно когда они происходят одновременно с ежегодными вспышками среди людей, повышают вероятность пандемии за счет слияния вирусов гриппа животных и человека. За последние несколько лет мир столкнулся с несколькими угрозами, имеющими пандемический потенциал, что делает возникновение следующей пандемии лишь вопросом времени».[31]

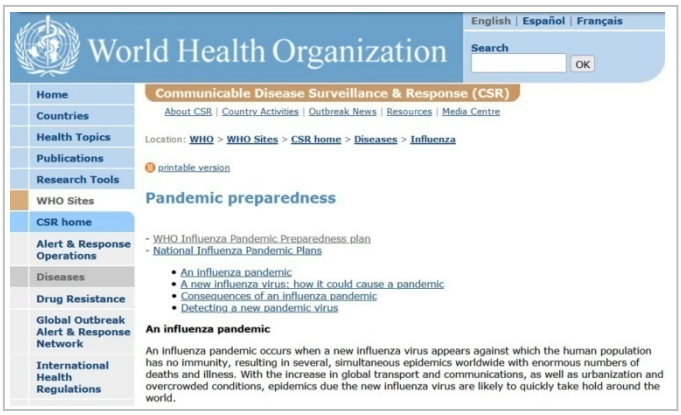

Рис. 5. Эпидемиологический надзор за инфекционными заболеваниями и реагирование в случае их возникновения ВОЗ, 2 февраля 2003; 14:05:45.[28]

В октябре 2008 года на сайте ВОЗ были внесены незначительные изменения: «*Пандемия гриппа* возникает, когда появляется новый вирус гриппа, против которого человеческое население не имеет иммунитета, что приводит к эпидемиям во всем мире с *большим числом случаев заболевания и смерти*».[32] Это определение пандемии сохранилось на веб-сайте ВОЗ до 4 мая 2009 года.[33]

8. Определение термина «пандемия» на веб-сайте ВОЗ после 6 мая 2009 года

В течение нескольких лет, начиная с 2003 года, ученые многих стран высказывали предостережения о возможном начале пандемии птичьего гриппа. Согласно плану по обеспечению готовности к пандемии от 1999 года, ВОЗ инициировала исследования, необходимые для быстрого производства новой вакцины. Однако после небольшого пика смертельных случаев в 2006 году (n=79), в последующие годы наметился их спад, и к концу 2008 года было очевидно, что угроза пандемии птичьего гриппа пошла на убыль.[34]

Несмотря на снижение потребности в вакцине против вируса птичьего гриппа, ее разработка и производство продолжались. В январе 2009 года австрийская фармацевтическая компания *Baxter* отправила емкости с «вакциной» против гриппа (H3N2) в биологические лаборатории Австрии, Германии, Чехии и Словении. Вскоре оказалось, что «вакцина» содержала живой вирус птичьего гриппа (H5N1). Представитель компании *Baxter* признался, что вместо вакцин они отправили «экспериментальный вирусный материал», что не было отражено в сопроводительных документах. К началу апреля 2009 года обсуждение темы распространения зараженной вакцины вышло на международный уровень. 8 апреля 2009 года в прокуратуру города Вены был подан иск против австрийского филиала компании *Baxter* и против компании *Avir Green Hills Biotechnology*.[35] Вскоре, а именно 14 апреля 2009 года, американский Центр по контролю и профилактике заболеваний (*Centers for Disease Control and Prevention* – CDC) сообщил о выявлении первого случая лихорадочного заболевания, вызванного новым штаммом свиного гриппа.[36]

23 апреля 2009 г. д-р Энн Шучат (*Schuchat*) сообщила о пяти новых случаях свиного гриппа. Возбудителем нового заболевания являлся реассортантный вирус, состоящий из генов четырех штаммов гриппа, а именно североамериканского свиного, североамериканского птичьего, евразийского свиного и сезонного человеческого.[37] 24 апреля 2009 года Ричард Бессер (*Besser*), исполняющий обязанности директора CDC, заявил, что эпидемия свиного гриппа началась в Мексике и в США.[38]

25 апреля 2009 года состоялось первое совещание Комитета по чрезвычайной ситуации, созванного Генеральным директором ВОЗ.[26] Список членов Комитета по чрезвычайной ситуации в связи с пандемией гриппа (H1N1), 2009 года, включал 15 человек.[39]

27 апреля 2009 г. после второго совещания Комитета, уровень предупреждения о пандемии гриппа был повышен с 3-й фазы до 4-й.[41]

29 апреля 2009 года, директор ВОЗ, доктор Чан, заявила: «Основываясь на оценке всей доступной информации и после нескольких консультаций с экспертами, я приняла решение повысить текущий уровень оповещения о пандемии гриппа с фазы 4 до фазы 5». Она также призвала правительства всех стран активировать свои планы готовности к пандемии и находиться в состоянии «повышенной готовности к необычным вспышкам гриппоподобных заболеваний и тяжелой пневмонии».[40]

В связи с нарастанием вероятности достижения высшей (6-й) фазы пандемии, в прессе началось обсуждение самого понятия *пандемия*. 29 апреля 2009 года, профессор общественного здравоохранения бостонского университета, Дэвид Озонофф (*Ozonoff*), комментируя вопрос о возможном изменении фазы пандемии, заявил, что слово *пандемия* несёт устрашающий смысл только из-за сравнения с пандемией гриппа «испанки». На самом деле, отличие пандемии от обычного протекания сезонного гриппа заключается лишь в том, что пандемию вызывает новый вирус, с неизученным течением заболевания и с неизвестной смертностью, к которому пока еще нет иммунитета, а течение заболевания может быть как тяжелым, так и легким.[42]

Однако 30 апреля 2009 г. официальные лица Мексики заявили, что эпидемия свиного гриппа оставалась стабильной в течение последних нескольких дней. Из 168 случаев, где причиной смерти предполагался свиной грипп, подтверждено только двенадцать.[43] Через два дня руководитель министерства здравоохранения Мексики, Хосе Анхель Кордова, заявил, что пик заболеваемости свиным гриппом пришелся на период с 23 по 28 апреля, а текущая динамика эпидемии указывает на ее спад. Он также предположил, что не позднее следующей недели страна вернется к обычной жизни.[44] Тем не менее, средства массовой информации, по-прежнему распространяли угрожающие новости, нагнетая страха перед будущей пандемией.[45]

4-го мая 2009 года, доктор Р. Бессер объявил, что принято решение изменить отчетность заболеваемости, которая теперь должна включать не только подтвержденные, но и вероятные случаи инфицирования вирусом H1N1 2009.[46] В этот же день, во время пресс-конференции, проводимой сотрудниками ВОЗ, репортер CNN выразил сомнение о возможном объявлении пандемии и указал на то, что на сайте ВОЗ, пандемия гриппа характеризуется «*большим числом случаев заболевания и смертей*». На это замечание, представитель ВОЗ по связям с общественностью, Натали Буду (*Boudou*), ответила, что «это определение было ошибочным... и оно будет исправлено».[13] Вечером того же дня определение пандемии исчезло с веб-сайта ВОЗ,[47] а новое определение появилось 6 мая 2009 года.[48]

Там было написано следующее:

«*Что представляет собой пандемия гриппа*?

Эпидемия той или иной болезни возникает тогда, когда число случаев этой болезни превышает обычный уровень. *Пандемия* представляет собой эпидемию той или иной болезни в мировом масштабе. *Пандемия* гриппа может возникнуть в том случае, когда появляется какой-либо новый вирус гриппа, против которого у людей нет иммунитета. В условиях увеличения масштабов перевозок на глобальном уровне, а также урбанизации и перенаселенности в некоторых районах, эпидемия, вызванная каким-либо новым вирусом гриппа, может распространиться во всем мире и превратиться в пандемию быстрее, чем это наблюдалось ранее. В целях создания глобальной системы оказания странам помощи в обеспечении готовности к пандемии и планированию необходимых мер ВОЗ определила соответствующие фазы пандемии. *Пандемии* – в зависимости от степени тяжести вызванной ими болезни и смертности – могут быть легкими или тяжелыми, причем в ходе пандемии уровень ее тяжести может изменяться».[48]

11 июня 2009 года, директор ВОЗ, д-р Маргарет Чан заявила: «... Я провела совещание с ведущими экспертами по гриппу, вирусологами и специалистами общественного здравоохранения. В соответствии с порядком действий, определенным в Международных медико-санитарных правилах, я обратилась за указаниями и рекомендациями к Комитету по чрезвычайной ситуации, учрежденному с этой целью. Имеющиеся фактические данные и их оценки, сделанные этими экспертами, указывают на то, что научно-обоснованные критерии свидетельствуют о наступлении пандемии гриппа. Поэтому, я решила поднять уровень предупреждения о пандемии гриппа с фазы 5 до фазы 6. Сейчас мир находится в начале пандемии гриппа 2009 года. Идут первые дни пандемии ... Ни одна предшествующая пандемия не была выявлена на таком раннем этапе ... *Сейчас мир может пожинать плоды*, которые принесли инвестиции в обеспечение готовности к пандемии, сделанные на протяжении последних пяти лет».[14]

В середине июля 2009 года представитель ВОЗ заявил: «На сегодняшний день пандемия характеризуется мягкостью симптомов у подавляющего большинства пациентов, которые обычно выздоравливают, даже без медицинского лечения, в течение недели после появления симптомов». Поэтому было рекомендовано прекратить тестирование на наличие вируса свиного гриппа.[49]

9. События, предшествовавшие корректировке описания пандемии на сайте ВОЗ в 2011 году

Повышение фазы пандемии до шестого, «*пандемического*» уровня сопровождалось активизацией антипандемических мероприятий. Большинство государственных чиновников и врачей по всему миру последовали рекомендациям ВОЗ, и начались массовое производство и закупка вакцин.

В тоже время, в некоторых средствах массовой информации появились критические комментарии, вызванные объявлением пандемии. По мнению их авторов, число случаев заболевания, в том числе тяжелых, а также смертность от нового вируса не превышали данные ежегодной статистики по сезонному гриппу.[50-52]

Были критические высказывания и со стороны опытных профессионалов, в частности, 5 ноября 2009 года, министр здравоохранения Польши, доктор Эва Копач (*Kopacz*), выступая на заседании польского парламента, заявила, что новое заболевание не опасней сезонного гриппа, и перед началом закупок вакцин нужно изучить результаты клинических испытаний, список ингредиентов, и отчет о побочных эффектах, которые не были предоставлены. Она также отметила, что ответственность за побочные эффекты должна лежать на производителях вакцин.[53]

Негативное отношение к использованию вакцин, не прошедших необходимые испытания, было поддержано заместителем министра здравоохранения Польши – Адамом Фрончак (*Fronczak*),[54] а также Премьер министром Польши – Дональдом Туском (*Tusk*).[55]

Наиболее серьезным ударом по пандемии стало заявление датских журналистов, обнаруживших признаки финансовой заинтересованности экспертов ВОЗ при объявлении пандемии.[56-57]

29 января 2010 года, Парламентская ассамблея Совета Европы (ПАСЕ) приняла резолюцию о проведении расследования влияния фармацевтического бизнеса на глобальную компанию по борьбе со свиным гриппом, уделяя особое внимание степени зависимости сотрудников ВОЗ от фармаиндустрии.[58]

4 июня 2010 года, Пол Флинн (*Flynn*), докладчик из Великобритании, сообщил о выявлении серьезных недостатков в прозрачности принятия решений о начале пандемии, что вызвало обеспокоенность по поводу влияния фармацевтической промышленности на принимаемые решения. Он также отметил, что ВОЗ не желает признавать факт внесения изменений в определение пандемии, а также пересмотреть прогноз дальнейшего развития пандемии. Флинн призвал представителей СМИ избегать сенсационности и паники в сфере общественного здравоохранения.[59]

24 июня 2010 года, ПАСЕ утвердила выводы своего Комитета по социальному здоровью и делам семьи. По мнению членов Ассамблеи, действия Всемирной организации здравоохранения, учреждений здравоохранения Европейского союза и национальных правительств привели к необоснованному опасению по поводу рисков для здоровья, с которыми столкнулись европейцы во время пандемии свиного гриппа, а также к растрате больших сумм государственных денег. В принятой резолюции говорится, что имелись *неопровержимые доказательства* того, что сотрудники ВОЗ *переоценили* серьезность пандемии, что привело к искажению приоритетов общественного здравоохранения.[60]

10 августа 2010 г. Генеральный директор ВОЗ д-р Маргарет Чан объявила, что пандемия гриппа, вызванная вирусом H1N1, завершена, т.е. наступил постпандемический период.[61] К этому времени вакцину получили не менее 350 миллионов человек.[62] Негативные последствие вакцинации против вирусаH1N1 наблюдались в течение нескольких лет.[63-64]

К середине марта 2011 года, независимая *Комиссия* экспертов сочла бездоказательными обвинения в коррупции в адрес руководства ВОЗ, поскольку сотрудники ВОЗ действовали в рамках закона, на основании имевшихся объективных данных.[65] В конце марта 2011 года, руководитель *Комиссии*, доктор Харви Файнберг (*Fineberg*), произнес оправдательную речь в офисе Всемирной Организации Здравоохранения.[66] В ответной речи директор ВОЗ, Маргарет Чан, поблагодарила членов Комиссии за высокую оценку усилий сотрудников ВОЗ во время пандемии свиного гриппа.[67]

17 мая 2011 года, Колумбийский университет присудил доктору Харви В. Файнбергу высшую награду в области общественного здравоохранения – премию Фрэнка А. Кальдерона.[68]

Определение пандемии, которое было на веб-сайте ВОЗ во время объявления пандемии свиного гриппа, сохранилось в течение двух лет. В 2011 году, между датами: 8 июля и 7 августа,[69-70] на сайте ВОЗ определение пандемии вернулось к прежнему варианту, который был до 4 мая 2009 года, а именно: «Пандемия гриппа возникает, когда появляется новый вирус гриппа, против которого человеческое население не имеет иммунитета, что приводит к эпидемиям во всем мире с большим числом случаев заболевания и смерти».[28,33]

Это определение пандемии было на веб-сайте ВОЗ, по крайней мере, до 3-го сентября 2011 года.[71]

Последующие страницы ВОЗ, посвященные пандемии гриппа, недоступны.[72] В некоторых случаях имеется следующее объяснение: «Страница или файл, к которому вы пытаетесь получить доступ, не найдены. Это связано с тем, что указан неверный веб-адрес, или файл был перемещен или удален. В 2020 году мы перенесли веб-контент в новую систему, поэтому часть старого контента в настоящее время может быть недоступна».[73]

Большинство страниц веб-сайта ВОЗ, относящихся к событиям, произошедшим до 2012 года, в настоящее время недоступно. Некоторые страницы, посвященные инфекционным заболеваниям и пандемии, были обнаружены на сайте архива – (https://web.archive.org/web/),[74] однако количество доступных страниц постепенно уменьшается. Для сохранений возможности проведений последующих исследований на тему пандемии свиного гриппа, собранный материал был систематизирован и опубликован.[1,35]

10. Обсуждение

Сравнение документов ВОЗ и страниц веб-сайта ВОЗ выявило различия в определении пандемии.

В «*Плане подготовки к пандемии гриппа*», изданном в 1999 году, помимо описания развития пандемии и выделения последовательных периодов и фаз пандемии, имело место разъяснение о том, что характерными признаками пандемии являются *высокая заболеваемость и смертность*.[16] В 2005 году, когда ведущие эпидемиологи прогнозировали скорое начало пандемии птичьего гриппа, при этом акцент на то, что пандемический вирус может вызвать эпидемию с *высокой заболеваемостью и смертностью* сохранился. Как следствие этого, задачей ВОЗ во время пандемии было объединение усилий систем здравоохранения различных стран для минимизации *заболеваемости и смертности*.[17]

В документе ВОЗ, опубликованном весной 2009 г., акцент на высокую заболеваемость и смертность, связанную с пандемическим вирусом и пандемией, был снят,[25] в связи с чем отпала необходимость в объединении усилий ВОЗ по минимизации заболеваемости и смертности.

На веб-сайте ВОЗ, привычная для многих характеристика пандемии, такая как, *большое число случаев заболевания и смерти*, присутствовала более шести лет.[28,33]

С небольшим изменением формулировки, но без изменения смысла, это определение пандемии использовали в правительственных документах Канады (Рис. 6), США и Великобритании, а также в других изданиях, опубликованных в 2004-2008 годах.[75-77]

2004-03-24 *Canada Gazette Part II, Vol. 138, No. 6*

Influenza Pandemic

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness[1].

Рис.6. Quarantine Act. *Canada Gazette* 2004; Mar 24, 138(6):113.[75]

На это же определение пандемии ссылались сотрудники Комитет Палаты представителей США по внутренней безопасности при написании документа, определяющего формат подготовки к пандемии гриппа, опубликованного в январе 2009 года.[78]

Тем не менее, во время пресс конференции, состоявшейся 4-го мая 2009, представитель ВОЗ, Натали Буду, сообщила, что определение пандемии, включавшее *большое число случаев заболевания и смерти* «было ошибочным... и оно будет исправлено».[13] 6-го мая на веб-сайте ВОЗ появилось новое определение пандемии, в котором акцент был смещен на распространение заболевания.[48] Некоторое время спустя, другой представитель ВОЗ, Грегори Хартл (*Hartl*), заявил,[79] что определение пандемии с *большим числом случаев заболевания и смерти* было размещено на веб-сайте в 2004 году, но оно не было официальным, поэтому следовало читать *Руководство по обеспечению готовности к пандемии*.

Трудно представить, что определение пандемии, находившееся на веб-сайте ВОЗ с февраля 2003 года по май 2009 года, было ошибочным, тем более, если учесть, изменения текста, которые осуществлялись в 2004, 2005 и 2008 годах.

Что касается заявления Грегори Хартла о том, что веб-сайт ВОЗ не отражает официальную позицию Всемирной Организации Здравоохранения, то слова Г. Хартла вызывают дополнительные вопросы к этой организации.

Например, в настоящее время нет никаких опубликованных документов ВОЗ, в которых подтверждено повышение уровня оповещения о пандемии гриппа с фазы 5 до фазы 6. При поиске в *google* (2009-2011) можно найти лишь две веб-ссылки, от 11 и 12 июня 2009, которые не принадлежат ВОЗ и напрямую не связанные с ВОЗ. (рис. 7)

Рис.7. «Поэтому я решила повысить уровень оповещения о пандемии гриппа с фазы 5 до фазы 6».[80]

Аналогичная ситуация произошла 11 марта 2020 года, когда размышления директора ВОЗ, имевшие место во время брифинга, были расценены, как побуждение к принятию решений на местах. При этом вновь не было опубликовано официальных документов ВОЗ, отражающих принятие коллективного решения экспертами ВОЗ.

Чтобы правильно понять смысл слов Н. Буду, Г. Хартла в 2009 году, и рассуждения Т. Гебреисуса в 2020, нужно послушать выступление директора ВОЗ на Всемирном правительственном саммите (12 февраля 2024 г.). В частности, он сказал:

«*Позвольте мне внести ясность*: во время пандемии COVID-19, ВОЗ никому ничего не навязывала. Ни режимов изоляции, ни требований в отношении масок и вакцин ... Наша задача – оказывать поддержку правительствам, предоставляя им научно обоснованные рекомендации, советы и, при необходимости, предметы медицинского назначения, чтобы помочь им защитить свое население. Но решения они принимают самостоятельно».[81]

В последующем, тема изменения определения пандемии обсуждалась неоднократно, но сотрудники ВОЗ настаивали, что никакого изменения определения пандемии не было.[59] На самом деле, это было правдой, поскольку ВОЗ никогда официально не определяла, что такое «*пандемия*», ни в документах ВОЗ, ни на веб-сайтах ВОЗ.[82]

Тем не менее, в середине лета 2011 года, определение пандемии на веб-сайте ВОЗ вернулось к первоначальному варианту с акцентом на *высокую заболеваемость и смертность*.[70]

11. Заключение

Понятие об эпидемиях, вызванных внешними причинами (*патогенами*), было известно в течение многих веков. Термин «пандемия» появился позже, чем термин «эпидемия», и мог иметь несколько значений. Его использовали, как синоним эпидемии; или для описания эпидемии, охватившей обширную территорию; или для указания на эпидемию инфекционного заболевания, сопровождающегося высокой смертностью, например, *пандемия* чумы, черной оспы или холеры. В XX веке термин «пандемия» стал использоваться по отношению к тяжело протекающей эпидемии гриппа, а также к неинфекционным заболеваниям, играющим ведущую роль в увеличении смертности среди населения большинства стран мира.

Если ссылаться на документ ВОЗ, подготовленный весной 2009 года, то объявление пандемии свиного гриппа в июне 2009 года было оправданным. Однако, учитывая предыдущую историю, здравый смысл и последствия объявления пандемии заболевания, не сопровождающегося большим числом случаев и высокой смертностью, это был преждевременный шаг, что нашло отражение в постановлении *Комитета по социальному здоровью и делам семьи* Парламентской ассамблеи Совета Европы.

Можно с горечью отметить, что, несмотря на достижения современной медицины, менее чем за четверть XXI века человечество успело пережить две пандемии, которых могло не быть. Среди причин объявления *пандемии* была расширенная трактовка этого термина, а также чрезмерное доверие проводимому тестированию и запоздалое использование патогенетического лечения.

Для образованного врача различия между *эпидемией* и *пандемией* не имеют большого значения. Опытный врач не делает акцент на название вируса или штамма, но в каждом конкретном случае он использует индивидуальное патогенетическое лечение, с учетом ведущего клинического синдрома.

Поэтому, чтобы минимизировать вероятность появление новой *пандемии*, необходимо изучить и внедрить эффективные лекарства и методы, использовавшиеся с древних времен до наших дней.

Рекомендуется изучить опыт лечения с использованием теории фазового развития инфекционного заболевания, и применительно к ней разработать методику субъективной и объективной оценки состояния больного, а также внедрить современные аналоги лекарственных препаратов, использовавшихся в те далекие времена.

Можно предположить, что повышение качества университетского образования и постдипломной специализации могут сыграть ведущую роль в эффективном лечении новых инфекционных заболеваний и в предупреждении возникновения будущих пандемий.

В результате проведенного исследования выявлена следующая последовательность основных исторических и эпидемиологических событий, предшествовавших и сопровождавших изменения определения пандемии на веб-сайте ВОЗ в 2009 и 2011 годах:

2003-2009: Нарастающая, но затем снижающаяся угроза развития пандемии птичьего гриппа;

2004-2009: Разработка и производство вакцин от виртуального пандемического штамма вируса птичьего гриппа;

2009, Январь: Австрийская компания *Baxter* разослала «вакцины», содержавшие живой вирус птичьего гриппа;

Апрель, 8: В прокуратуру города Вены подан иск против австрийского филиала компании *Baxter* и против компании *Avir Green Hills Biotechnology*;

Апрель, 14: CDC: Американский Центр по контролю и профилактике заболеваний (CDC) сообщил о выявлении первого случая лихорадочного заболевания на территории США, вызванного новым штаммом свиного гриппа;

Апрель, 22: Сообщение о возможной утечке патогенов из лаборатории, находящейся в г. Фредерик (Мэриленд);[83]

Апрель, 23: CDC: Д-р Энн Шучат сообщила о том, что возбудителем нового заболевания являлся реассортантный вирус, состоящий из генов четырех штаммов гриппа, а именно североамериканского свиного, североамериканского птичьего, евразийского свиного и сезонного человеческого;

Апрель, 24: CDC: Д-р. Ричард Бессер, исполняющий обязанности директора CDC, заявил о начале эпидемии свиного гриппа в Мексике и США;

Апрель, 25: ВОЗ: Состоялось первое совещание Комитета по чрезвычайной ситуации, созванного Генеральным директором ВОЗ;

Апрель, 27: ВОЗ: Уровень предупреждения о пандемии гриппа повышен с 3-й фазы до 4-й;

Апрель, 28: Министр здравоохранения Индонезии предполагает, что новый вирус имеет искусственное происхождение;[84]

Апрель, 29: ВОЗ: Уровень предупреждения о пандемии гриппа повышен с 4-й фазы до 5-й;

Май, 2: Министр здравоохранения Мексики, заявил, что, эпидемия идет на спад, и, вероятно, на следующей неделе страна вернется к обычной жизни;

Май, 4: CDC: Д-р. Ричард Бессер объявил, что теперь отчет по свиному гриппу должен включать не только подтвержденные, но и вероятные случаи инфицирования вирусом H1N1 2009;

Май, 4: ВОЗ: Во время пресс-конференции, Натали Буду, заявила, что определение пандемии на веб-сайте ВОЗ, где пандемия гриппа характеризовалась «*большим числом случаев заболевания и смертей*», было ошибочным... и оно будет исправлено;

Май, 4 (20:58): Определение пандемии исчезло с веб-сайта ВОЗ;

Май, 5: Геннадий Онищенко в интервью на *Эхо Москвы*, заявил, что «*ВОЗ выступает в роли маркетингового отдела фирмы Ля Рошэ*».[85]

Май, 6 (00:51): На веб-сайте ВОЗ появилось новое определение пандемии;

Май, 12: Эксперты заявляют, что свиной грипп может быть результатом человеческой (лабораторной) ошибки;[86]

Июнь, 11: ВОЗ: Уровень предупреждения о пандемии гриппа повышен с 5-й фазы до 6-й;

Июнь, 18: В ходе инвентаризации потенциально смертельных патогенов в лаборатории инфекционных заболеваний в Форт-Детрик, было обнаружено более 9000 флаконов, которые не были учтены;[87]

Июнь, 30: Эксперты продолжают утверждать, что вирус свиного гриппа имеет искусственное происхождение;[88]

Июль, 16: ВОЗ: Отмена тестирования на наличие вируса свиного гриппа;

Май-Октябрь: Обсуждение и разработка *проекта первой глобальной вакцинации*;

Октябрь, 24: Президент США, Барак Обама объявил в США чрезвычайную ситуацию, связанную с пандемией гриппа H1N1 2009 года;

Ноябрь, 5: Министр здравоохранения Польши, Эва Копач, выступая на заседании польского парламента, заявила, что новое заболевание не опасней сезонного гриппа. Производители вакцин должны предоставить список ингредиентов, входящих в вакцины, и документы с результатами клинических испытаний; они также должны нести ответственность за побочные действия вакцин;

Ноябрь, 16: Датские журналисты обвинили сотрудников ВОЗ в коррупционных связях с производителями вакцин;

Ноябрь, 25: В газете *Новые Известия* появилась статья Алексея Смирнова, «Агенты вливания», вызвавшая в России волну статьей и передач о лже-пандемии и о коррупции среди сотрудников ВОЗ;

Декабрь, 18: Доктор Вольфганг Водарг, председатель Комитет по социальному здоровью и делам семьи Парламентской ассамблеи Совета Европы (ПАСЕ), и группа парламентариев, внесли на обсуждение тему: – «*Фальшивые пандемии – угроза здоровью*»; Д-р. В. Водарг обвинил сотрудников ВОЗ в организации ложной пандемии и в коррупционных связях с производителями вакцин;

2010, январь, 12: Тема «*Фальшивые пандемии – угроза здоровью*» была запланирована для обсуждения на пленарном заседании зимней сессии ПАСЕ;

Январь, 29: ПАСЕ приняла резолюцию о проведении расследования влияния фармацевтических компаний на глобальную кампанию по борьбе со свиным гриппом, уделяя особое внимание степени влияния фармацевтической промышленности на ВОЗ;

Июнь, 4: В докладе перед членами Комитета по социальному здоровью и делам семьи, ПАСЕ, Пол Флинн со-

общил о выявлении серьезных недостатков в прозрачности принятия решений; ... Он также отметил, что ВОЗ не желает признавать факт внесения изменений в определение пандемии, а также пересмотреть прогноз дальнейшего развития пандемии;

Июнь, 24: ПАСЕ утвердила выводы своего Комитет по социальному здоровью и делам семьи. В принятой резолюции говорится, что имелись *неопровержимые доказательства* того, что сотрудники ВОЗ *переоценили* серьезность пандемии, что привело к искажению приоритетов общественного здравоохранения.

Август, 10: Генеральный директор ВОЗ д-р Маргарет Чан объявила, что пандемия гриппа, вызванная вирусом H1N1, завершена.

2011, март: независимая *Комиссия* экспертов, изучавшая действия сотрудников ВОЗ до начала пандемии и во время пандемии свиного гриппа, сочла бездоказательными обвинения в коррупции в адрес руководства ВОЗ;

Март, 28: Руководитель *Комиссии*, Д-р Харви Файнберг (*Fineberg*), произнес оправдательную речь в офисе Всемирной Организации Здравоохранения.

Март, 28: Директор ВОЗ, Маргарет Чан, поблагодарила членов Комиссии за высокую оценку усилий сотрудников ВОЗ во время пандемии свиного гриппа.

Май, 17: Колумбийский университет присудил доктору Харви В. Файнбергу высшую награду в области общественного здравоохранения – премию Фрэнка А. Кальдерона.

2011, Июль-Август: На веб-сайте ВОЗ определение пандемии вернулось к первоначальному варианту с акцентом на *высокую заболеваемость и смертность*.

Для анализа фактов и выявления причинно-следственных связей между вышеуказанными событиями, подготовлены специальные сборники по теме пандемии свиного гриппа.[1,35, 89-91]

Definition of Pandemic:
the causes and consequences of its adjustment in 2009 and 2011

SSRN, 31 May 2024
https://ssrn.com/abstract=4848086

Besides the main text this Preprint contains the 11th part, titled – *The Chronology of the events*

...

11. Chronology of the events

This study has revealed the following sequence of the significant historical and epidemiological events that preceded and accompanied changes in the definition of a pandemic on the WHO website in 2009 and 2011:

2003-2009: Increasing, but then decreasing in probability of an Avian Flu pandemic.[32]

2004-2009: Development and production of vaccines against a virtual pandemic strain of the Avian Flu virus.[77]

2009, January: The Austrian company Baxter delivered "vaccines" against seasonal flu which contained live deadly Avian Flu virus.[33]

April 8: A lawsuit was filed with the Vienna City Prosecutor's Office against the Austrian branch of Baxter and Avir Green Hills Biotechnology.[78]

April 14: CDC: The American Centers for Disease Control and Prevention (CDC) announced the identification of the first case of a febrile illness in the United States caused by a new strain of swine flu.[79]

...

"For years, the organization's web site defined an influenza pandemic
as causing 'enormous numbers of deaths and illness.'
But the agency recently pulled the definition,
apologizing for causing confusion and anxiety."
[*The New York Times*, 8 June 2009]

Abstract

The study was carried out to evaluate historical and epidemiological events that preceded and accompanied the adjustment of the description of a pandemic on the WHO website in 2009 and 2011.

Since the cause of the change in the description of a pandemic on the WHO website is not clear, analyses of the literature related to the epidemics and pandemics, WHO documents, WHO website, and articles published in journals and the Internet have been done.

Until early May 2009, the description of the pandemic focused on "enormous numbers of cases and deaths." On May 6, 2009, a new description of the pandemic was published, focusing on the prevalence of the disease; in 2011 it reverted to the initial one without any comments. From the perspective of the WHO document issued in 2009, the declaration of a swine flu pandemic in June 2009 seemed justified. However, considering the previous pandemic history, common sense, and the consequences of declaring a pandemic for a disease not accompanied by a high number of cases and high mortality, it was a premature move.

Since the primary factor hindering the development of a pandemic is the effectiveness of treating infectious disease, to minimize the likelihood of a new pandemic, it is necessary to improve the quality of special medical education and to study and adapt to modern conditions all effective drugs and methods used in the past.

Key words: pandemic, epidemic, swine flu, WHO, H1N1

1. Background

An analysis of WHO website pages dedicated to influenza pandemics revealed changes in the use of the term "pandemic" between 2009 and 2011. Some changes were reflected in WHO documents and the media, while others went unnoticed.

The purpose of this study is to identify the historical and epidemiological events that preceded and accompanied changes in the WHO website's definition of a pandemic.

2. Materials and methods

Since the cause of the change of the description of a pandemic on the WHO website in 2009 and 2011 is not clear, analyses of the literature related to the epidemics and pandemics, WHO documents, WHO website, and articles published in journals and the Internet pages have been done. This study aims to reveal the main historical and epidemiological events that preceded and accompanied the adjustment of the description of a pandemic on the WHO website in 2009 and 2011.

To optimize this study, pages of the WHO website dedicated to the description of a pandemic were collected in a thematic digest containing text and page screenshots.[1]

3. Introduction

Infectious diseases, as well as epidemics, have been well-known since ancient times. The Chinese Canon of the Internal, believed to date from the tenth century BC, describes external pathogens that can cause acute illness and affect large numbers of people at once. A forecast regarding the occurrence of such diseases could be made by observing the weather in the first days of the Chinese New Year.[2]

At that time, doctors knew that the course of a disease in each case depended on the patient's initial state and his "defense energy" (Wei Qi).[3] By "defense energy," one can mean a complex response of the immune and other body systems involved in the pathogenetic and sanogenetic reactions of the patient.

Despite the variety of external pathogens represented by thousands of viruses and bacteria, the human body has a limited set of protective reactions known in modern pathophysiology as inflammation, fever, hypoxia, general adaptation syndrome, and others. These pathogenetic syndromes are accompanied by nonspecific symptoms, such as fever, weakness, chills or feeling hot, headache, cough, shortness of breath, nausea, vomiting, diarrhea, skin rash, discoloration of the skin, and so on, which have similar pathogenesis, regardless of the causative agent of the infectious disease.

With all the variety of pathogens, in the case of the development of any febrile disease, only two main mechanisms are involved that lead to an increase in temperature - an increase in heat production or a decrease in heat transfer.[4] Similarly, 2-3 mechanisms are involved in forming each clinical syndrome.

About 1800 years ago, Dr. Zhang Zhongjing studied the results of previous generations of research and developed a theory of acute infectious diseases that explained the diagnosis and treatment of leading syndromes. According to this theory, in the case of the development of an acute infectious process, there is a change in six phases of the disease, reflecting the gradual inclusion of various levels of protection. Each phase can proceed according to one of two or three options. Thus, the variety of clinical syndromes associated with acute infectious diseases can be reduced to ten or twelve options, each of which a protocol of etiopathogenetic treatment has been developed.[5] When symptoms change and, accordingly, when the clinical syndrome changes, a new treatment must be selected. Therefore, in treating one patient, the protocol for the use of drugs was constantly changed following changes in the main symptoms of the disease. (fig. 1) This phenomenon could explain failed clinical trials conducted by modern scientists unfamiliar with phases of an infectious disease.

There are some examples of treatment of the initial phases of infectious diseases: in the case of initial fever with general cold feelings without sweating – *Herba Ephedrae* was recommended; if there is initial fever with general hot feelings – *Folium Mori Albae* or *Herba Menthae Haplocalycis* should be used; if there is initial fever with intensive sweating or tension in the muscles – *RamulusCinnamomiCassiae* was recommended; in the case of fever with alternating cold and hot feelings – *Radix Bupleuri*, was used, and so on. A change in symptoms pointed to a change in the phase of the disease and required an adjustment of therapy. If a patient has a severe fever with hemorrhagic symptoms, skin rashes, kidney and liver impairment, delirium, and other symptoms of aggravation of the disease – *Radix of Isatis tinctoria* should be applied.[6] In the succeeding centuries, protocols for treating infectious diseases were updated following a new understanding of the etiology and pathogenesis of diseases and advances in pharmacology.

1.	*Tai Yang*	Common cold symptoms
2.	*Shao Yang*	Unstable phase
3.	*Yang Ming*	Progressive fever
4.	*Tai Yin*	Beginning of exhaustion
5.	*Shao Yin*	High fever, hemorrhagic and other Complications
6.	*Jue Yin*	

Figure 1. Six phases of acute infectious diseases evolution.

A modern physician who has studied Hans Selye's General Adaptation Syndrome[7] is only familiar with a limited version of Dr. Zhang's theory of acute infectious diseases and needs more knowledge to apply it at the patient's bedside.

It can be assumed that the development of an epidemic or pandemic depends not so much on the danger of an external pathogen but on the knowledge and experience of the doctor and on his ability to choose an individual treatment corresponding to the current phase of the acute disease. Therefore, training a doctor who knows how to use effective means and methods of treatment should be the basis for a successful fight against future pandemics. Otherwise, we are in for a series of pandemics reminiscent of those that occurred in 2009-2010 and 2020-2023, when the main hope was placed on quarantine, movement restrictions, and mass vaccination.

4. A brief overview of the pre-1999 definition of a pandemic

In a dictionary published in London in 1791, the term epidemic (*epidemius*) refers to a disease that affects many people simultaneously and then disappears. In the same dictionary, the word pandemic (*pandemius*) is explained as a synonym for the word epidemic.[8]

In a dictionary published in Philadelphia in 1874, there is an explanation, that the term 'Epidemic' (*Epidemius*) derived from the Greek words – ἐπί (epi), meaning "upon", and – δῆμος (dēmos), meaning "people" is applied to any disease which seems to be upon the entire population of a country at one time.[9] A term 'Pandemia' also derived from Greek words – παν (pan), that means "all" or "everything", and – δῆμος (dēmos), that means "people". This term refers to the disease which affects the people of a country generally.[10]

At the end of the 20th century, the term "epidemic" took on a broader meaning and began to be applied to an unusual increase in the number of cases of a particular disease, both infectious and non-infectious. The term "pandemic" is used to describe an epidemic affecting a very high proportion of the population of a significant geographic region but "customarily restricted to diseases such as cholera, plague, and influenza".[11,12]

The discussion of the contradictions between the necessity and legitimacy of using the term "pandemic" began in early May 2009,[13] i.e., about a month before June 11, 2009, when the Director-General of the World Health Organization (WHO), Dr. Margaret Chan, stated: "*The world is now at the start of the 2009 influenza pandemic*".[14]

5. Definition of the "pandemic" in the WHO documents published in 1999-2017

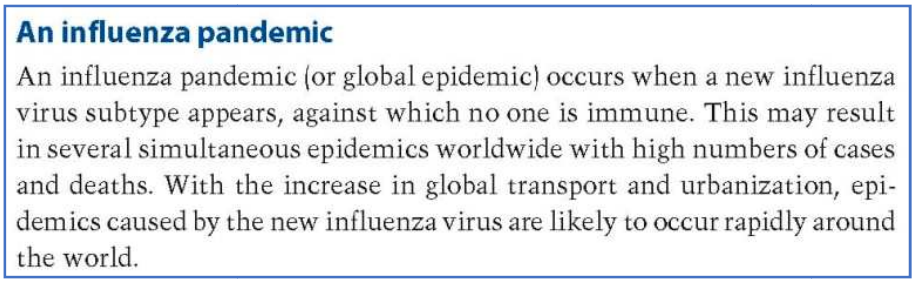
In 1999, the WHO issued a document, the *Influenza Pandemic Preparedness Plan*. It referred to influenza pandemics that occurred in 1918, 1957, and 1968 and provided a detailed description of the phases of pandemic development, including the Inter-Pandemic phase, the Preparedness phase

(three levels), and the Pandemic period (four phases), after which the Post-Pandemic period, that is the same as the Inter-Pandemic one began again.[15]

The 1999 document did not define what a pandemic was but clarified that "A pandemic will be declared when the new virus sub-type has been shown to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that serious morbidity and mortality is likely in at least one segment of the population".[15] Thus, the criterion for the onset of a pandemic was *serious morbidity and mortality*.

Due to the emergence of sporadic cases of avian influenza a new document was issued in 2004, where the following description of the emergence of a pandemic was given: "An influenza pandemic occurs with the appearance of a new influenza virus against which none of the population has any immunity. This results in several simultaneous epidemics worldwide with *enormous numbers of cases and deaths*. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics resulting from a new influenza virus are likely to be established quickly around the world".[16] Thus, the main pandemic criterion as *enormous numbers of cases and deaths* remained unchanged.

The following are the descriptions of the pandemic presented in the WHO documents in subsequent years, suggesting that the characteristics of the pandemic have remained the same. For example, "Influenza pandemics are associated with *high morbidity, excess mortality*, and social and economic disruption" (January 2005).[16] "Influenza pandemics (worldwide epidemics) have occurred at irregular and unpredictable intervals, and have been associated with *substantial morbidity, mortality* and economic cost" (March 2005).[18] "An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with *high numbers of cases and deaths*. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world." (Spring 2005).[19] (fig. 2) "Influenza pandemics (worldwide epidemics) ... have been associated with *substantial morbidity, mortality* and economic cost (October 2005).[20] In addition, documents of the WHO emphasized that the pandemic virus may lead to several simultaneous epidemics worldwide, resulting in *high numbers of cases and deaths*,[18] or *considerable morbidity and mortality*.[21]



An influenza pandemic

An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with high numbers of cases and deaths. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world.

Figure 2. WHO checklist for influenza pandemic. preparedness planning. – WHO, 2005, p. vi.[19]

In March 2005, the WHO prepared one more document – *WHO Global Influenza Preparedness Plan*[22] which, like the previous documents, stated that the pandemic virus could cause significant *morbidity and mortality* in all age groups. This new document mentioned the 1918, 1957, and 1968 influenza pandemics, which claimed millions of lives. It also provided a detailed description of six phases of the development of a pandemic, all of which were characterized by an increased and sustained transmission in the general population.

The first objective for the WHO leadership during a pandemic (phase 6) was "to minimize morbidity and mortality" associated with current human infections.[22] Thus the pandemic was still characterized by *high morbidity and mortality*; otherwise, there would be no reason to lower these parameters.

The development of the following WHO document – *Pandemic Influenza Preparedness and Response*, was completed in the spring of 2009. According to a 'Google search,' the new edition was published on April 26, 2009,[23] on the very next day after the first meeting of the Emergency Committee convened by the WHO Director-General to address the swine flu outbreak.[24] (fig. 3)

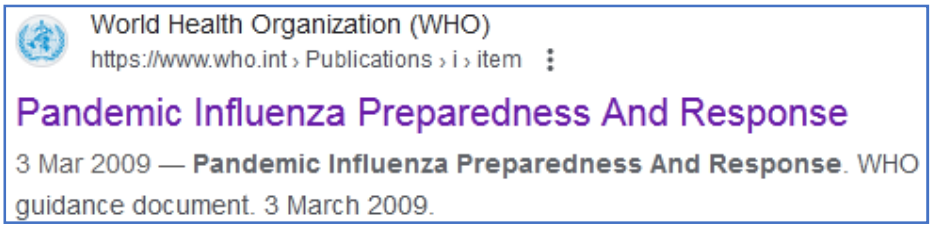
Pandemic Influenza Preparedness and Response: A WHO ...

Apr 26, 2009 — **Pandemic Influenza Preparedness and Response**: A WHO Guidance

Figure 3. Pandemic Influenza Preparedness and Response. – WHO, April 26, 2009

When conducting a new search during the preparation of the latest version of this study (20.05.24), it was mentioned that a new edition of the *Pandemic Influenza Preparedness and Response*, was published on March 3, 2009 (fig. 4).



World Health Organization (WHO)
https://www.who.int › Publications › i › item
Pandemic Influenza Preparedness And Response
3 Mar 2009 — Pandemic Influenza Preparedness And Response. WHO guidance document. 3 March 2009.

Figure 4. Pandemic Influenza Preparedness and Response. – WHO, March 3, 2009

Like the previous analog document, published in 2005, the new one mentioned the 1918, 1957, and 1968 influenza pandemics, which claimed millions of lives; however, the occurrence of the word 'mortality' or 'death' in the new document has decreased by half. The new document retained the six-phase structure. The Phase 6 (the pandemic phase) was characterized "by community level outbreaks in at least one other country in a different WHO region in addition to the criteria defined in Phase 5".[23]

There was no definition of a pandemic; various pandemic phases differ only in the prevalence of infection without considering the severity of the course of the disease and mortality. According to the new document, WHO did not commit "*to minimize morbidity and mortality*," as it was in the document issued in 2005. This document was used as a guide to declare the swine flu pandemic on June 11, 2009.

In the document issued by the WHO in 2017 – *Guidelines on Regulatory Preparedness* for provision of marketing authorization of human pandemic influenza vaccines in non-vaccine-producing countries, it was mentioned that a pandemic could cause several simultaneous epidemics worldwide with *high numbers of cases of clinical disease and deaths*.[25]

6. Definition of the term "pandemic" on the WHO website before May 4, 2009

In 2003-2005, the section on infectious diseases was entitled *Communicable Disease Surveillance & Response*.[26] In October 2005, this page was renamed *Epidemic and Pandemic Alert and Response*.[27] On July 10, 2009, the WHO website dedicated to infectious diseases was named *Global Alert and Response*.[28]

The first description of a pandemic, available on the WHO website, dates back to February 2, 2003. In particular, it says: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with *enormous numbers of deaths and illness*." Further: "With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due

the new influenza virus are likely to quickly take hold around the world" (fig. 5).[26] This description was similar to that which appeared in the WHO document published in 2005.[19]

In the second half of June 2004, an addendum appeared on the WHO website: "Outbreaks of influenza in animals, especially when happening simultaneously with annual outbreaks in humans, increase the chances of a pandemic, through the merging of animal and human influenza viruses. During the last few years, the world has faced several threats with pandemic potential, making the occurrence of the next pandemic just a matter of time".[29]

In October 2008, minor changes were made on the WHO website: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness".[30] This definition of a pandemic remained on the WHO website until May 4, 2009.[31]

An influenza pandemic
An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world.

Figure 5. Pandemic Influenza Preparedness and Response.[26]

7. The historical and epidemiological events that preceded the adjustment of the description of a pandemic on the WHO website in May 2009

For several years, commencing in 2003, scientists in many countries have warned about the possible beginning of an avian influenza pandemic. Under the 1999 Pandemic Preparedness Plan, the WHO initiated the research necessary to produce a new vaccine rapidly. However, after a small peak in deaths in 2006, they began to decline in subsequent years, and by the end of 2008, it was clear that the threat of an avian influenza pandemic had subsided.[32]

Despite declining demand for an avian influenza vaccine, development and production continued. In January 2009, the Austrian pharmaceutical company Baxter sent containers with a

"vaccine" against influenza (H3N2) to biological laboratories in Germany, the Czech Republic, and Slovenia. It was soon discovered that the "vaccine" contained live avian influenza (H5N1) virus. At first, a Baxter spokesman said that the vaccine was contaminated accidentally. However, he later admitted that "experimental viral material" was sent instead of vaccines, which was not noticed in the accompanying documents. By the beginning of April 2009, the discussion of the spread of the contaminated vaccine had reached the international level. On April 8, 2009, a lawsuit was filed against the Austrian branch of Baxter and against AVIR Green Hills Biotechnology.[33]

On April 17, 2009, the Center for Disease Control and Prevention (CDC) determined that two cases of febrile respiratory illness in southern California were infected with a swine influenza A (H1N1) virus.[34] On April 23, 2009, Dr. Anne Schuchat (Director of CDC's National Center for Influenza and Respiratory Diseases), reported about five new cases and informed that the causative agent of the new disease was a reassortant virus consisting of the genes of four strains of influenza, namely North American swine, North American avian, Eurasian swine, and human seasonal.[35] On April 24, 2009, Richard Besser, acting director of the CDC, declared that a swine flu epidemic had begun in Mexico and the United States.[36]

On April 25, 2009, the first meeting of the Emergency Committee convened by the Director-General of WHO took place.[25] Two days later, after the second meeting of the Committee, the pandemic influenza alert level was raised from Phase 3 to Phase 4.[37] On April 29, 2009, WHO Director Dr. Chang stated: "Based on assessment of all available information, and following several expert consultations, I have decided to raise the current level of influenza pandemic alert from phase 4 to phase 5." She also urged all governments to activate their pandemic preparedness plans and be on "high alert for unusual outbreaks of influenza-like illness and severe pneumonia".[38]

However, on April 30, 2009, Mexican officials said the swine flu epidemic was stable for several days. Of the 168 deaths attributed to swine flu, only 12 have been confirmed.[39] On May 3, 2009, the Mexican Health Minister, Jose Angel Cordova, said the swine flu virus peaked between April 23 and 28, and the evolution of an epidemic began to decline. He also assumed businesses would return to regular activity during the week and schools would be opened for studies.[40]

On May 4, 2009, Dr. R. Besser announced a change in reporting of morbidity, which should now include confirmed and probable cases of the infection with the 2009 H1N1 virus.[41]

On the same day, during a press conference held by WHO staff, a CNN reporter expressed doubt about a possible pandemic announcement and pointed out that on the WHO website, the flu pandemic was characterized by "enormous numbers of deaths and illness." To this remark, WHO's public relations representative, Natalie Boudou, replied, "*It was a mistake*, *and we apologize for the confusion. The definition was put up a while ago and paints a rather bleak picture and could be very scary*".[13] On the evening of May 4, the definition of a pandemic disappeared from the WHO

website,[42] and a new definition appeared on May 6, 2009. It read as follows:"What is an influenza pandemic? A disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity. With the increase in global transport, as well as urbanization and overcrowded conditions in some areas, epidemics due to a new influenza virus are likely to take hold around the world, and become a pandemic faster than before. WHO has defined the phases of a pandemic to provide a global framework to aid countries in pandemic preparedness and response planning. Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic".[43]

On June 11, 2009, WHO Director Dr. Margaret Chan stated: "... I have conferred with leading influenza experts, virologists, and public health officials. In line with procedures set out in the International Health Regulations, I have sought guidance and advice from an Emergency Committee established for this purpose. On the basis of available evidence, and these expert assessments of the evidence, the scientific criteria for an influenza pandemic have been met. I have therefore decided to raise the level of influenza pandemic alert from phase 5 to phase 6. The world is now at the start of the 2009 influenza pandemic".[14]

In mid-July 2009, the WHO representative stated: "This pandemic has been characterized, to date, by the mildness of symptoms in the overwhelming majority of patients, who usually recover, even without medical treatment, within a week of the onset of symptoms." Therefore it was recommended to stop testing for the swine flu virus.[44]

8 The historical and epidemiological events that preceded the adjustment of the description of a pandemic on the WHO website in 2011

The increase in the pandemic phase to the sixth level was accompanied by the intensification of anti-pandemic measures. Most government officials and doctors around the world followed the recommendations of the WHO, in connection with which mass production and purchase of antiviral drugs and vaccines began. At the same time, some scientists and journalists believed that the pandemic announcement lacked common sense because mortality from the new virus did not exceed the seasonal influenza statistics.[45,46]

Besides, there were criticisms from professionals and officials. In particular, on November 5, 2009, Polish Minister of Health, Dr. Ewa Kopacz, speaking at a meeting of the Polish Parliament, said that the new disease is not more dangerous than seasonal flu, and before starting to purchase vaccines, it is necessary to study the results of clinical trials, the list of ingredients, and reports on

side effects which had not been provided. She also noted that vaccine manufacturers should be held responsible for side effects.[47]

Following standard requirements for obtaining approval to use vaccines and a negative attitude towards the use of vaccines that have not passed the necessary tests and clinical trials were supported by the Deputy Minister of Health of Poland – Adam Fronczak,[48] as well as the Prime Minister of Poland – Donald Tusk.[49]

The most dramatic blow to the "pandemic" was the statement of Dutch journalists who found signs of financial interest in WHO experts when declaring a pandemic.[50]

On January 20, 2010, the Parliamentary Assembly of the Council of Europe (PACE) adopted a resolution to investigate the influence of pharmaceutical companies on the global swine flu campaign, focusing on the extent of the pharmaceutical industry's influence on the WHO.[51]

On June 24, 2010, PACE approved the conclusions of its Social, Health and Family Affairs Committee. According to the Assembly, the actions of the WHO, the health institutions of the European Union, and national Governments have led to unjustified concerns about the health risks faced by Europeans during the swine flu pandemic and the wastage of large sums of public money. The adopted resolution states that there was irrefutable evidence that WHO staff overestimated the severity of the pandemic, which led to a distortion of public health priorities. Paul Flynn, a speaker from the UK, reported on identifying severe shortcomings in the transparency of decision-making about the pandemic outbreak, which raised concerns about the influence of the pharmaceutical industry on decisions made. He also noted that the WHO wanted to deny making changes to the definition of a pandemic and revising the forecast of further development of the pandemic. Flynn also urged the media to avoid sensationalizing and staring up panic in public health.[52-53]

On August 10, 2010, WHO Director-General Dr. Margaret Chan announced that the H1N1 influenza pandemic was over, and the post-pandemic period had begun.[54] By this time, at least 350 million people had received the vaccine.[55] Adverse reactions after vaccination against the H1N1 virus have been observed for several years.[56-57]

By mid-March 2011, a new independent Committee of Experts found that accusations of corruption against WHO management were unsubstantiated since WHO employees acted within the law, based on the available objective data.[58] At the end of March 2011, the head of the Commission, Dr. Harvey Fineberg delivered a vindication speech at the office of the World Health Organization.[59] In a response speech, WHO Director Margaret Chan thanked the members of the Commission for appreciating the efforts of WHO staff during the swine flu pandemic.[60] On May 17, 2011, Columbia University awarded Dr. Harvey W. Feinberg its highest honor in public health, the Frank A. Calderone Prize.[61]

The new description of a pandemic on the WHO website had been in place for a little more than two years. In 2011, between July 8 and August 7,[62-63] the WHO website reverted to the description of a pandemic that was prior to May 4, 2009, namely: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide *with enormous numbers of deaths and illness*." This description was on the WHO website until September 2011.[64]

Subsequent WHO pages on influenza pandemics are not accessible.[65] In some cases, the explanation was: "*The page or file you are trying to access was not found.* This is because the web address was incorrect or the file had been moved or deleted. We migrated web content to a new platform in 2020, so some old content may no longer be available".[66]

Most WHO website pages relating to events before 2012 are currently unavailable. Small number of pages on infectious diseases and pandemics have been found on the archive website (https://web.archive.org/web/),[67] but the number of available pages is gradually decreasing. To maintain the possibility of further research on the swine flu pandemic, the collected web pages were systematized and published.[1,33...000]

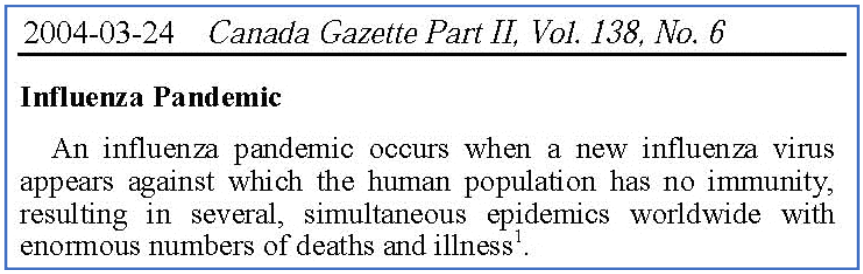
9. Discussion

A comparison of the WHO documents and pages on the WHO website published in different years revealed fundamental differences in the description of a pandemic.

In the WHO document issued in 1999, there was an explanation that the characteristic attributes of a pandemic were *high morbidity and mortality*.[15] In 2005, when leading epidemiologists predicted the imminent start of an avian influenza pandemic, the emphasis that a pandemic virus could cause an epidemic with high morbidity and mortality was retained. Therefore, the first objective of WHO during a pandemic was to unite the efforts of the health systems of various countries *to minimize morbidity and mortality*.[22]

In the WHO document published in the spring of 2009, the emphasis on high morbidity and mortality associated with a pandemic virus and pandemic was removed,[23] in connection with which there was no need for a unifying effort by WHO *to minimize morbidity and mortality*.

On the WHO website, the description of a pandemic familiar to many, such as the "*enormous numbers of deaths and illness*," had been present for over six years.[26,64] With a slight change in wording but without change in meaning, it was used by the governments of Canada, (fig. 6) the United States, the United Kingdom, (fig. 7) and other officials who prepared documents dealing with the pandemic in 2004-2008.[68-71]



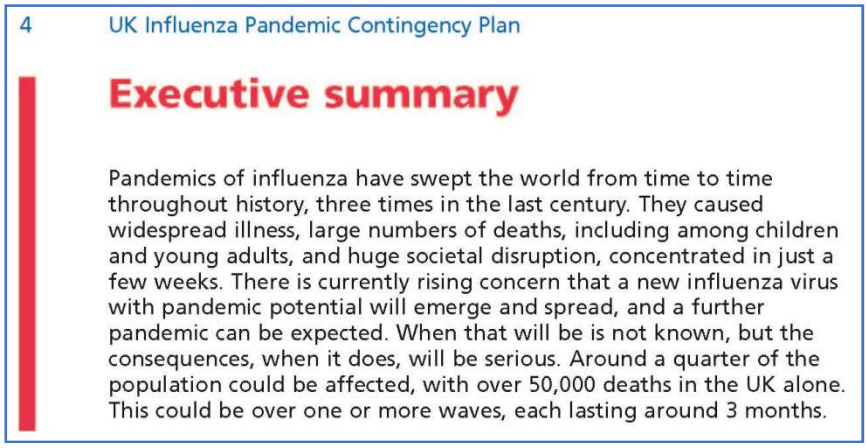
2004-03-24 *Canada Gazette Part II, Vol. 138, No. 6*

Influenza Pandemic

An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness[1].

Figure 6. Quarantine Act. – Canada Gazette 2004; Mar 24, 138(6): 113.[68]

Nevertheless, during a press conference held on May 4, 2009, Natalie Boudou, a WHO communications officer, said that the definition of a pandemic, which included "*enormous numbers of deaths and illness*," was wrong and would be corrected.[13] Sometime later, another WHO representative, Gregory Hartl, stated that the definition of a pandemic with *enormous numbers of deaths and illness* was posted on the website in 2004, however, it was not official, so the Pandemic Preparedness Guide should be read.[72]



4 UK Influenza Pandemic Contingency Plan

Executive summary

Pandemics of influenza have swept the world from time to time throughout history, three times in the last century. They caused widespread illness, large numbers of deaths, including among children and young adults, and huge societal disruption, concentrated in just a few weeks. There is currently rising concern that a new influenza virus with pandemic potential will emerge and spread, and a further pandemic can be expected. When that will be is not known, but the consequences, when it does, will be serious. Around a quarter of the population could be affected, with over 50,000 deaths in the UK alone. This could be over one or more waves, each lasting around 3 months.

Figure 7. Pandemic Flu: UK Influenza Pandemic Contingency Plan. – London, 20 Oct 2005, p. 4.[69]

Remarks

One cannot imagine that the definition of a pandemic on the WHO website from February 2003 to May 2009 was incorrect, especially given the changes to the text that were made in 2004, 2005, and 2008.

Besides that, Hartl's statement that the WHO website does not reflect the official position of the World Health Organization raises additional questions for this organization. For example, currently, there is no published document confirming that the Director General of the WHO has raised the influenza pandemic alert level from Phase 5 to Phase 6. A Google search (2009-2011) revealed only two web links, dated June 11 and 12, 2009,[73] which do not belong to the WHO and are not directly associated with the WHO. (Fig. 8) Does it mean that all documents disappeared or did not exist?

Figure 8. "I have therefore decided to raise the level of influenza pandemic alert from phase 5 to phase 6"

A similar incident occurred on March 11, 2020,[74] when the WHO Director's thoughts on the pandemic expressed during his briefing were perceived as prompting local decision-making. However, no official WHO documents reflecting the collective decision made by WHO experts have been published so far.

To understand the statements of N. Budu and G. Hartl in 2009 and the reasoning of T. Ghebreyesus in 2020, one should listen to the speech of the WHO Director at the World Government Summit (February 12, 2024). In particular, he said: "Let me be clear: *WHO did not impose anything on anyone* during the COVID-19 pandemic. Not lockdowns, not mask mandates, not vaccine mandates… Our job is to support governments with evidence-based guidance, advice and, when needed, supplies, to help them protect their people. But the decisions are theirs".[75]

After the Paul Flynn report (June 4, 2010), the changes in the definition of a pandemic were discussed many times, but WHO staff insisted that it was not changed.[52] Actually, it was true since WHO has never formally defined pandemic influenza either in the WHO documents or on the WHO websites.[76] However, in mid-summer 2011, the description of a pandemic on the WHO website reverted to its original definition with *enormous numbers of deaths and illness*.[63]

10. Conclusion

The concept of epidemics caused by external pathogens has been known for many centuries. The term "pandemic" appeared later than "epidemic" and could have several meanings. It was used as a synonym for an epidemic, or to describe an epidemic that covered a vast territory, or to indicate an epidemic of an infectious disease accompanied by high mortality, like a pandemic of plague, smallpox, or cholera. In the 20th century, the term "pandemic" began to be used with severe influenza epidemics and non-communicable diseases that increased mortality in most countries.

From the formal perspective of the WHO document issued in 2009, the declaration of a swine flu pandemic in June 2009 seemed justified. However, taking into account the previous history, common sense, and the consequences of declaring a pandemic for a disease not accompanied by a

high number of cases and high mortality, it was a somewhat premature move, which was reflected in the resolution of the Health Committee of the Parliamentary Assembly of the Council of Europe.

Despite the achievements of modern medicine, in less than a quarter of the 21st century, humanity managed to survive two pandemics that could not have happened. From a practitioner's point of view, the difference between a pandemic, an epidemic, and one infectious disease case is irrelevant. A knowledgeable and experienced physician will not focus on the name of the virus or its strain since, in each case, individual pathogenesis-based treatment is used, considering the leading clinical syndrome.

To minimize the likelihood of a new pandemic studying and implementing all effective medicines and methods from ancient times to the present is necessary. Medical Universities should include Dr. Zhan's universal theory of acute infectious diseases in the curriculum. According to this theory, the progression of any viral infectious disease is accompanied by a succession of specific clinical syndromes, reflecting the inclusion of various phases of the pathogenesis of the infectious process. Assessing the patient's complaints is sufficient to use this theory in practice. The development of modern drugs, used in the past according to Dr. Zhan's theory, will effectively treat any new infectious disease without waiting for the results of clinical trials.

Thus, by improving the quality of the university education and postgraduate medical specialization, the problem of successful treatment of new infectious diseases can be solved, and future epidemics and pandemics be prevented.

11. Chronology of the events

This study has revealed the following sequence of the significant historical and epidemiological events that preceded and accompanied changes in the definition of a pandemic on the WHO website in 2009 and 2011:

2003-2009: Increasing, but then decreasing in probability of an Avian Flu pandemic.[32]

2004-2009: Development and production of vaccines against a virtual pandemic strain of the Avian Flu virus.[77]

2009, January: The Austrian company Baxter delivered "vaccines" against seasonal flu which contained live deadly Avian Flu virus.[33]

April 8: A lawsuit was filed with the Vienna City Prosecutor's Office against the Austrian branch of Baxter and Avir Green Hills Biotechnology.[78]

April 14: CDC: The American Centers for Disease Control and Prevention (CDC) announced the identification of the first case of a febrile illness in the United States caused by a new strain of swine flu.[79]

April 22: Cable News Network (CNN) reported the possible leaking of pathogens from a laboratory in Frederick, Maryland.[80]

April 23: CDC: Dr. Ann Schuchat reported that the causative agent of the new disease was a reassortant virus consisting of genes from four strains of influenza, namely North American swine, North American avian, Eurasian swine, and seasonal human.

April 24: CDC: Dr. Richard Besser, acting director of the CDC, announced the beginning of the swine flu epidemic in Mexico and the United States.

April 25: WHO: The first meeting of the Emergency Committee convened by the WHO Director-General took place.

April 26: WHO: A new edition of the "Pandemic Influenza Preparedness and Response" was published on line.

April 27: WHO: Influenza pandemic alert level raised from phase 3 to phase 4.

April 28: Indonesian Health Minister suggests that the new virus is of artificial origin. [84]

April 29: WHO: Influenza pandemic alert level raised from phase 4 to phase 5.

May 2: Mexico's Health Minister said that the epidemic is declining, and the country will probably return to normal life next week.

May 4: CDC: Dr. Richard Besser announced that the swine flu report must now include both confirmed and probable cases of infection with the 2009 H1N1 virus.

May 4: WHO: During a press conference, a WHO representative, Nathalie Boudou, stated that the previous definition of the pandemic with the *enormous numbers of deaths and illnesses* … "was a mistake, and we apologize for the confusion."

May 4 (20:58): The definition of a pandemic has disappeared from the WHO website.

May 5: The Chief State Sanitary Doctor of Russia, Gennady Onishchenko, in an interview with Echo of Moscow, stated that “WHO acts as the marketing department of the La Roche company." [85]

May 6 (00:51): A new definition of the pandemic has appeared on the WHO website.

May 12: Experts say swine flu may result from human (laboratory) error. [86]

June 11: WHO: Pandemic influenza alert level raised from phase 5 to phase 6.

June 18: An inventory of potentially deadly pathogens at Fort Detrick's infectious disease laboratory found more than 9,000 vials that had not been accounted for. [87]

June 30: Experts continue to claim that the swine flu virus is of artificial origin. [88]

July 16: WHO: Canceling testing for swine flu virus.

May-October: Discussion and development of the first global vaccination project.

October 24: US President Obama declared a national emergency in the United States due to the 2009 H1N1 influenza pandemic.

November 5: Polish Minister of Health Ewa Kopacz, speaking at a meeting of the Polish parliament, said that the new disease is no more dangerous than seasonal flu. Vaccine manufacturers must provide a list of vaccine ingredients and clinical trial results.

November 16: Danish journalists accused WHO employees of corrupt connections with vaccine manufacturers.

November 25: The newspaper Novye Izvestia published an article "Agents of Infusion," which ended the propaganda about the Swine pandemic in Russia.

December 18: Dr. Wolfgang Wodarg, Chairman of the Committee on Social Health and Family Affairs of the Parliamentary Assembly of the Council of Europe (PACE), and a group of parliamentarians introduced the topic for discussion: – "False pandemics - a threat to health"; Dr. V. Wodarg accused WHO employees of organizing a false pandemic and having corrupt connections with vaccine manufacturers.

2010, January 12: The topic "Fake pandemics - a threat to health" was planned for discussion at the plenary session of the PACE winter session.

January 29: PACE adopted a resolution to investigate the influence of pharmaceutical companies on the global campaign against swine flu, paying particular attention to the degree of influence of the pharmaceutical industry on the WHO.

June 4: In a report to members of the Committee on Social Health and Family Affairs, PACE, Paul Flynn reported the identification of severe shortcomings in the transparency of decision-making; ... He also noted that WHO does not want to acknowledge the fact that changes have been made to the definition of a pandemic, as well as to revise the forecast for the further development of the pandemic.

June 24: PACE approved the conclusions of its Committee on Social Health and Family Affairs. The resolution said there was overwhelming evidence that WHO officials overestimated the severity of the pandemic, resulting in misrepresentation of public health priorities.

August 10: WHO Director-General Dr Margaret Chan announced that the influenza pandemic caused by the H1N1 virus is over.

2011, March: A new independent Committee of Experts, which studied the actions of WHO employees before and during the swine flu pandemic, found the accusations of corruption against the WHO leadership unsubstantiated.

March 28: The head of the Commission, Dr. Harvey Fineberg, gave an acquittal speech at the office of the World Health Organization.

March 28: WHO Director Margaret Chan thanked Commission members for appreciating the efforts of WHO staff during the swine flu pandemic.

May 17: Columbia University awarded Dr. Harvey W. Feinberg its highest honor in public health, the Frank A. Calderon Award.

2011, July-August: The WHO website returned to the original definition of a pandemic, emphasizing high morbidity and mortality.

Special digests related to the Swine Flu pandemic have been prepared to collect facts and to identify cause-and-effect relationships between events presented above. [1,35, 89-91]

THE DEFINITION OF PANDEMIC: CAUSES AND CONSEQUENCES OF ITS ADJUSTMENT IN 2009 AND 2011

Bionion Sdn Bhd. № 1, Jalan Sungai Jeluh 32/192, Shah Alam, 40460, Selangor, Malaysia

The article considers results of the study evaluating historical and epidemiological events that preceded and accompanied adjustment of the pandemic description on the WHO website in 2009 and 2011.
The analysis covered publications related to epidemics and pandemics issues, the WHO documents, the WHO website.
The descriptions of pandemic mostly focused on "enormous numbers of cases and deaths". Since May 2009, new description of pandemic was published, focusing on disease prevalence. In 2011 it reverted to initial one with no comments. From perspective of the WHO document of 2009, declaration of swine flu pandemic in June 2009 seemed justified. However, considering previous pandemic history, common sense and consequences of declaring pandemic of disease with low both number of cases and mortality, it was premature move.
Since primary factor hindering development of pandemic is effectiveness of infectious disease treatment, to minimize likelihood of new pandemic it is necessary to improve special medical education quality and to study and to adapt to modern conditions all effective medications and methods used in the past.

K e y w o r d s : pandemic; epidemic; swine flu; the WHO; H1N1.

"For years, the organization's web site defined an influenza pandemic as causing 'enormous numbers of deaths and illness.' But the agency recently pulled the definition, apologizing for causing confusion and anxiety."

(*The New York Times*, 8 June 2009)

Introduction

Infectious diseases, as well as epidemics, have been well-known since ancient times. The Chinese Yellow Emperor's Inner Canon, believed to date from the tenth century BC, describes external pathogens that can cause acute infectious diseases which affect many people simultaneously [1]. At that time, doctors knew that the course of a disease in each case depended on the patient's initial state and his "defense energy" (Wei Qi) [2]. By "defense energy," one can mean a complex response of the immune and other body systems involved in the pathogenetic and sanogenetic reactions of the patient.

Despite the variety of external pathogens represented by thousands of viruses and bacteria, the human body has a limited set of protective reactions known in modern pathophysiology as inflammation, fever, hypoxia, general adaptation syndrome, and others. These pathogenetic syndromes are accompanied by nonspecific symptoms, such as fever, weakness, chills or feeling hot, headache, cough, shortness of breath, nausea, vomiting, diarrhea, skin rash, discoloration of the skin, and so on, which have similar pathogenesis, regardless of the causative agent of the infectious disease.

With all the variety of pathogens, in the case of the development of any febrile disease, only two main mechanisms are involved that lead to an increase in temperature — an increase in heat production or a decrease in heat transfer [3]. Similarly, 2–3 mechanisms are involved in forming each clinical syndrome.

About 1800 years ago, Dr. Zhang Zhongjing studied the results of previous generations of research and developed a theory of acute infectious diseases that explained the diagnosis and treatment of leading syndromes. According to this theory, in the case of the development of an acute infectious process, there is a change in six phases of the disease, reflecting the gradual inclusion of various levels of protection. Each phase can proceed according to one of two or three options. Thus, the variety of clinical syndromes associated with acute infectious diseases can be reduced to ten or twelve options, each of which a protocol of etiopathogenetic treatment has been developed [4]. When symptoms change and, accordingly, when the clinical syndrome changes, a new treatment must be selected. Therefore, in treating one patient, the protocol for the use of drugs was constantly changed following changes in the main symptoms of the disease. This phenomenon could ex-

The problems of social hygiene, public health and history of medicine. 2024; 32(4)
DOI: http://dx.doi.org/10.32687/0869-866X-2024-32-4-691-697

plain failed clinical trials conducted by modern scientists unfamiliar with phases of an infectious disease.

There are some examples of treatment of the initial phases of infectious diseases: in the case of initial fever with general cold feelings without sweating — *Herba Ephedrae* was recommended; if there is initial fever with general hot feelings — *Folium Mori Albae* or *Herba Menthae Haplocalycis* should be used; if there is initial fever with intensive sweating or tension in the muscles — *Ramulus Cinnamomi Cassiae* was recommended; in the case of fever with alternating cold and hot feelings — *Radix Bupleuri*, was used, and so on. A change in symptoms pointed to a change in the phase of the disease and required an adjustment of therapy. If a patient has a severe fever with hemorrhagic symptoms, skin rashes, kidney and liver impairment, delirium, and other symptoms of aggravation of the disease — *Radix of Isatis tinctoria* should be applied [5]. In the succeeding centuries, protocols for treating infectious diseases were updated following a new understanding of the etiology and pathogenesis of diseases and advances in pharmacology.

A modern physician who has studied Hans Selye's General Adaptation Syndrome [6] is only familiar with a limited version of Dr. Zhang's theory of acute infectious diseases and needs more knowledge to apply it at the patient's bedside.

It can be assumed that the development of an epidemic or pandemic depends not so much on the danger of an external pathogen but on the knowledge and experience of the doctor and on his ability to choose an individual treatment corresponding to the current phase of the acute disease. Therefore, training a doctor who knows how to use effective means and methods of treatment should be the basis for a successful fight against future pandemics. Otherwise, we are in for a series of pandemics reminiscent of those that occurred in 2009–2010 and 2020–2023, when the main hope was placed on quarantine, movement restrictions, and mass vaccination.

Materials and methods

Since the cause of the change of the description of a pandemic on the WHO website in 2009 and 2011 is not clear, analyses of the literature related to the epidemics and pandemics, WHO documents, WHO website, and articles published in journals and the Internet pages have been done. This study aims to reveal the main historical and epidemiological events that preceded and accompanied the adjustment of the description of a pandemic on the WHO website in 2009 and 2011.

To optimize this study, pages of the WHO website dedicated to the description of a pandemic were collected in a thematic digest containing text and page screenshots [7].

Results

A brief overview of the pre-1999 definition of a pandemic

In a dictionary published in London in 1791, the term epidemic (*epidemius*) refers to a disease that affects many people simultaneously and then disappears. In the same dictionary, the word pandemic (*pandemius*) is explained as a synonym for the word epidemic [8].

In a dictionary published in Philadelphia in 1874, there is an explanation, that the term 'Epidemic' (*Epidemius*) derived from the Greek words — ἐπί (epi), meaning "upon", and δῆμος (dēmos), meaning "people" is applied to any disease which seems to be upon the entire population of a country at one time [9]. A term 'Pandemia' also derived from Greek words — παν (pan), that means "all" or "everything", and δῆμος (dēmos), that means "people". This term refers to the disease which affects the people of a country generally [10].

At the end of the 20th century, the term "epidemic" took on a broader meaning and began to be applied to an unusual increase in the number of cases of a particular disease, both infectious and non-infectious. The term "pandemic" is used to describe an epidemic affecting a very high proportion of the population of a significant geographic region but "customarily restricted to diseases such as cholera, plague, and influenza" [11, 12].

The discussion of the contradictions between the necessity and legitimacy of using the term "pandemic" began in early May 2009 [13], i.e., about a month before June 11, 2009, when the Director-General of the World Health Organization (WHO), Dr. Margaret Chan, stated: "*The world is now at the start of the 2009 influenza pandemic*" [14].

Definition of the "pandemic" in the WHO documents published in 1999–2017

In 1999, the WHO issued a document, the "Influenza Pandemic Preparedness Plan". It referred to influenza pandemics that occurred in 1918, 1957, and 1968 and provided a detailed description of the phases of pandemic development, including the Inter-Pandemic phase, the Preparedness phase (three levels), and the Pandemic period (four phases), after which the Post-Pandemic period, that is the same as the Inter-Pandemic one began again [15].

The 1999 document did not define what a pandemic was but clarified that "A pandemic will be declared when the new virus sub-type has been shown to cause several outbreaks in at least one country, and to have spread to other countries, with consistent disease patterns indicating that serious morbidity and mortality is likely in at least one segment of the population" [15]. Thus, the criterion for the onset of a pandemic was *serious morbidity and mortality*.

Due to the emergence of sporadic cases of avian influenza a new document was issued in 2004, where the following description of the emergence of a pandemic was given: "An influenza pandemic occurs with the appearance of a new influenza virus against which none of the population has any immunity. This results in several simultaneous epidemics worldwide with *enormous numbers of cases and deaths*. With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics resulting from a new influenza virus are likely to be established quickly around the world" [16]. Thus, the main pandemic crite-

rion as *enormous numbers of cases and deaths* remained unchanged.

The following are the descriptions of the pandemic presented in the WHO documents in subsequent years, suggesting that the characteristics of the pandemic have remained the same. For example, "Influenza pandemics are associated with *high morbidity, excess mortality*, and social and economic disruption" (January 2005). [17] "Influenza pandemics (worldwide epidemics) have occurred at irregular and unpredictable intervals, and have been associated with *substantial morbidity, mortality* and economic cost" (March 2005) [18]. "An influenza pandemic (or global epidemic) occurs when a new influenza virus subtype appears, against which no one is immune. This may result in several simultaneous epidemics worldwide with *high numbers of cases and deaths*. With the increase in global transport and urbanization, epidemics caused by the new influenza virus are likely to occur rapidly around the world." (Spring 2005) [19]. "Influenza pandemics (worldwide epidemics) … have been associated with *substantial morbidity, mortality* and economic cost (October 2005) [20]. In addition, documents of the WHO emphasized that the pandemic virus may lead to several simultaneous epidemics worldwide, resulting in *high numbers of cases and deaths* [18], or *considerable morbidity and mortality* [21].

In March 2005, the WHO prepared one more document — "WHO Global Influenza Preparedness Plan" [22] which, like the previous documents, stated that the pandemic virus could cause significant *morbidity and mortality* in all age groups. This new document mentioned the 1918, 1957, and 1968 influenza pandemics, which claimed millions of lives. It also provided a detailed description of six phases of the development of a pandemic, all of which were characterized by an increased and sustained transmission in the general population.

The first objective for the WHO leadership during a pandemic (phase 6) was "to minimize morbidity and mortality" associated with current human infections [22]. Thus the pandemic was still characterized by *high morbidity and mortality*; otherwise, there would be no reason to lower these parameters.

The development of the following WHO document — "Pandemic Influenza Preparedness and Response," was completed in the spring of 2009. According to a 'Google search,' the new edition was published on April 26, 2009 [23], on the very next day after the first meeting of the Emergency Committee convened by the WHO Director-General to address the swine flu outbreak [24].

Like the previous analog document, published in 2005, the new one mentioned the 1918, 1957, and 1968 influenza pandemics, which claimed millions of lives; however, the occurrence of the word 'mortality' or 'death' in the new document has decreased by half. The new document retained the six-phase structure. The Phase 6 (the pandemic phase) was characterized "by community level outbreaks in at least one other country in a different WHO region in addition to the criteria defined in Phase 5" [23].

There was no definition of a pandemic; various pandemic phases differ only in the prevalence of infection without considering the severity of the course of the disease and mortality. According to the new document, WHO did not commit "*to minimize morbidity and mortality*," as it was in the document issued in 2005. This document was used as a guide to declare the swine flu pandemic on June 11, 2009.

In the document issued by the WHO in 2017 — "Guidelines on Regulatory Preparedness for provision of marketing authorization of human pandemic influenza vaccines in non-vaccine-producing countries," it was mentioned that a pandemic could cause several simultaneous epidemics worldwide with *high numbers of cases of clinical disease and deaths* [25].

Definition of the term "pandemic" on the WHO website before May 4, 2009

In 2003–2005, the section on infectious diseases was entitled "Communicable Disease Surveillance & Response." In October 2005, this page was renamed "Epidemic and Pandemic Alert and Response." On July 10, 2009, the WHO website dedicated to infectious diseases was named "Global Alert and Response" [7].

The first description of a pandemic, available on the WHO website, dates back to February 2, 2003. In particular, it says: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with *enormous numbers of deaths and illness*". Further: "With the increase in global transport and communications, as well as urbanization and overcrowded conditions, epidemics due the new influenza virus are likely to quickly take hold around the world" [7]. This description was similar to that which appeared in the WHO document published in 2005 [19].

In the second half of June 2004, an addendum appeared on the WHO website: "Outbreaks of influenza in animals, especially when happening simultaneously with annual outbreaks in humans, increase the chances of a pandemic, through the merging of animal and human influenza viruses. During the last few years, the world has faced several threats with pandemic potential, making the occurrence of the next pandemic just a matter of time" [7].

In October 2008, minor changes were made on the WHO website: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness". This definition of a pandemic remained on the WHO website until May 4, 2009 [7].

The historical and epidemiological events that preceded the adjustment of the description of a pandemic on the WHO website in May 2009

For several years, commencing in 2003, scientists in many countries have warned about the possible beginning of an avian influenza pandemic. Under the 1999 Pandemic Preparedness Plan, the WHO initiated the re-

The problems of social hygiene, public health and history of medicine. 2024; 32(4)
DOI: http://dx.doi.org/10.32687/0869-866X-2024-32-4-691-697

search necessary to produce a new vaccine rapidly. However, after a small peak in deaths in 2006, they began to decline in subsequent years, and by the end of 2008, it was clear that the threat of an avian influenza pandemic had subsided [26].

Despite declining demand for an avian influenza vaccine, development and production continued. In January 2009, the Austrian pharmaceutical company Baxter sent containers with a "vaccine" against influenza (H3N2) to biological laboratories in Germany, the Czech Republic, and Slovenia. It was soon discovered that the "vaccine" contained live avian influenza (H5N1) virus. At first, a Baxter spokesman said that the vaccine was contaminated accidentally. However, he later admitted that "experimental viral material" was sent instead of vaccines, which was not noticed in the accompanying documents. By the beginning of April 2009, the discussion of the spread of the contaminated vaccine had reached the international level. On April 8, 2009, a lawsuit was filed against the Austrian branch of Baxter and against AVIR Green Hills Biotechnology [27].

On April 17, 2009, the Center for Disease Control and Prevention (CDC) determined that two cases of febrile respiratory illness in southern California were infected with a swine influenza A (H1N1) virus [28]. On April 23, 2009, Dr. Anne Schuchat (Director of CDC's National Center for Influenza and Respiratory Diseases), reported about five new cases and informed that the causative agent of the new disease was a reassortant virus consisting of the genes of four strains of influenza, namely North American swine, North American avian, Eurasian swine, and human seasonal [29]. On April 24, 2009, Richard Besser, acting director of the CDC, declared that a swine flu epidemic had begun in Mexico and the United States [30].

On April 25, 2009, the first meeting of the Emergency Committee convened by the Director-General of WHO took place [24]. Two days later, after the second meeting of the Committee, the pandemic influenza alert level was raised from Phase 3 to Phase 4 [31]. On April 29, 2009, WHO Director Dr. Chang stated: "Based on assessment of all available information, and following several expert consultations, I have decided to raise the current level of influenza pandemic alert from phase 4 to phase 5." She also urged all governments to activate their pandemic preparedness plans and be on "high alert for unusual outbreaks of influenza-like illness and severe pneumonia" [32].

However, on April 30, 2009, Mexican officials said the swine flu epidemic was stable for several days. Of the 168 deaths attributed to swine flu, only 12 have been confirmed [33]. On May 3, 2009, the Mexican Health Minister, Jose Angel Cordova, said the swine flu virus peaked between April 23 and 28, and the evolution of an epidemic began to decline. He also assumed businesses would return to regular activity during the week and schools would be opened for studies [34].

On May 4, 2009, Dr. R. Besser announced a change in reporting of morbidity, which should now include confirmed and probable cases of the infection with the 2009 H1N1 virus [35]. On the same day, during a press conference held by WHO staff, a CNN reporter expressed doubt about a possible pandemic announcement and pointed out that on the WHO website, the flu pandemic was characterized by "enormous numbers of deaths and illness". To this remark, WHO's public relations representative, Natalie Boudou, replied, "It was a mistake, and we apologize for the confusion. The definition was put up a while ago and paints a rather bleak picture and could be very scary" [13]. On the evening of May 4, the definition of a pandemic disappeared from the WHO website [7], and a new definition appeared on May 6, 2009. It read as follows: "What is an influenza pandemic? A disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity. With the increase in global transport, as well as urbanization and overcrowded conditions in some areas, epidemics due to a new influenza virus are likely to take hold around the world, and become a pandemic faster than before. WHO has defined the phases of a pandemic to provide a global framework to aid countries in pandemic preparedness and response planning. Pandemics can be either mild or severe in the illness and death they cause, and the severity of a pandemic can change over the course of that pandemic" [7].

On June 11, 2009, WHO Director Dr. Margaret Chan stated: "…I have conferred with leading influenza experts, virologists, and public health officials. In line with procedures set out in the International Health Regulations, I have sought guidance and advice from an Emergency Committee established for this purpose. On the basis of available evidence, and these expert assessments of the evidence, the scientific criteria for an influenza pandemic have been met. I have therefore decided to raise the level of influenza pandemic alert from phase 5 to phase 6. The world is now at the start of the 2009 influenza pandemic" [14].

In mid-July 2009, the WHO representative stated: "This pandemic has been characterized, to date, by the mildness of symptoms in the overwhelming majority of patients, who usually recover, even without medical treatment, within a week of the onset of symptoms". Therefore it was recommended to stop testing for the swine flu virus [36].

The historical and epidemiological events that preceded the adjustment of the description of a pandemic on the WHO website in 2011

The increase in the pandemic phase to the sixth level was accompanied by the intensification of anti-pandemic measures. Most government officials and doctors around the world followed the recommendations of the WHO, in connection with which mass production and purchase of antiviral drugs and vaccines began. At the same time, some scientists and journalists believed that the pandemic announcement lacked common sense because mortality from the new virus did not exceed the seasonal influenza statistics [37, 38].

Besides, there were criticisms from professionals and officials. In particular, on November 5, 2009, Polish Minister of Health, Dr. Ewa Kopacz, speaking at a meeting of the Polish Parliament, said that the new disease is not more dangerous than seasonal flu, and before starting to purchase vaccines, it is necessary to study the results of clinical trials, the list of ingredients, and reports on side effects which had not been provided. She also noted that vaccine manufacturers should be held responsible for side effects [39].

The most severe blow to the "pandemic" was the statement of journalists who found signs of financial interest in WHO experts when declaring a pandemic [40].

At the end of January 2010, the Parliamentary Assembly of the Council of Europe (PACE) adopted a resolution to investigate the influence of pharmaceutical companies on the global swine flu campaign, focusing on the extent of the pharmaceutical industry's influence on the WHO [41].

On June 24, 2010, PACE approved the conclusions of its Health Committee. According to the Assembly, the actions of the WHO, the health institutions of the European Union, and national Governments have led to unjustified concerns about the health risks faced by Europeans during the swine flu pandemic and the wastage of large sums of public money. The adopted resolution states that there was irrefutable evidence that WHO staff overestimated the severity of the pandemic, which led to a distortion of public health priorities. Paul Flynn, a speaker from the UK, reported on identifying severe shortcomings in the transparency of decision-making about the pandemic outbreak, which raised concerns about the influence of the pharmaceutical industry on decisions made. He also noted that the WHO wanted to deny making changes to the definition of a pandemic and revising the forecast of further development of the pandemic. Flynn also urged the media to avoid sensationalizing and staring up panic in public health [42].

On August 10, 2010, WHO Director-General Dr. Margaret Chan announced that the H1N1 influenza pandemic was over, and the post-pandemic period had begun [43].

The new description of a pandemic on the WHO website had been in place for a little more than two years. In 2011, between July 8 and August 7, the WHO website reverted to the description of a pandemic that was prior to May 4, 2009, namely: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide *with enormous numbers of deaths and illness*". This description was on the WHO website until September 2011. Subsequent WHO influenza pandemic pages are not available [7].

Discussion

A comparison of the WHO documents and pages on the WHO website published in different years revealed fundamental differences in the description of a pandemic.

In the WHO document issued in 1999, there was an explanation that the characteristic attributes of a pandemic were *high morbidity and mortality* [15]. In 2005, when leading epidemiologists predicted the imminent start of an avian influenza pandemic, the emphasis that a pandemic virus could cause an epidemic with high morbidity and mortality was retained. Therefore, the first objective of WHO during a pandemic was to unite the efforts of the health systems of various countries *to minimize morbidity and mortality* [22].

In the WHO document published in the spring of 2009, the emphasis on high morbidity and mortality associated with a pandemic virus and pandemic was removed [23], in connection with which there was no need for a unifying effort by WHO *to minimize morbidity and mortality*.

On the WHO website, the description of a pandemic familiar to many, such as the "*enormous numbers of deaths and illness*," had been present for over six years [7]. With a slight change in wording but without change in meaning, it was used by the governments of Canada, the United States, the United Kingdom, and other officials who prepared documents dealing with the pandemic in 2004–2008 [44–46].

Nevertheless, during a press conference held on May 4, 2009, Natalie Boudou, a WHO communications officer, said that the definition of a pandemic, which included "*enormous numbers of deaths and illness*," was wrong and would be corrected [13]. Sometime later, another WHO representative, Gregory Hartl, stated that the definition of a pandemic with *enormous numbers of deaths and illness* was posted on the website in 2004, however, it was not official, so the Pandemic Preparedness Guide should be read [47].

In the following months, changing the definition of a pandemic was discussed many times, but WHO staff insisted that there was no change in the definition of a pandemic [42]. Actually, it was true since WHO has never formally defined pandemic influenza either in the WHO documents or on the WHO websites [48]. However, in mid-summer 2011, the description of a pandemic on the WHO website reverted to its original definition with *enormous numbers of deaths and illness* [7].

Conclusion

The concept of epidemics caused by external pathogens has been known for many centuries. The term "pandemic" appeared later than "epidemic" and could have several meanings. It was used as a synonym for an epidemic, or to describe an epidemic that covered a vast territory, or to indicate an epidemic of an infectious disease accompanied by high mortality, like a pandemic of plague, smallpox, or cholera. In the 20th, the term "pandemic" began to be used with severe influenza epidemics and non-communicable diseases that increased mortality in most countries.

From the formal perspective of the WHO document issued in 2009, the declaration of a swine flu pandemic in June 2009 seemed justified. However, taking into account the previous history, common sense, and the consequences of declaring a pandemic for a disease not accompanied by a high number of cases and high mortality, it was a somewhat premature move, which was re-

flected in the resolution of the Health Committee of the Parliamentary Assembly of the Council of Europe.

Despite the achievements of modern medicine, in less than a quarter of the 21st century, humanity managed to survive two pandemics that could not have happened. From a practitioner's point of view, the difference between a pandemic, an epidemic, and one infectious disease case is irrelevant. A knowledgeable and experienced physician will not focus on the name of the virus or its strain since, in each case, individual pathogenesis-based treatment is used, considering the leading clinical syndrome.

To minimize the likelihood of a new pandemic studying and implementing all effective medicines and methods from ancient times to the present is necessary. Medical Universities should include Dr. Zhan's universal theory of acute infectious diseases in the curriculum. According to this theory, the progression of any viral infectious disease is accompanied by a succession of specific clinical syndromes, reflecting the inclusion of various phases of the pathogenesis of the infectious process. Assessing the patient's complaints is sufficient to use this theory in practice. The development of modern drugs, used in the past according to Dr. Zhan's theory, will effectively treat any new infectious disease without waiting for the results of clinical trials.

Thus, by improving the quality of the university education and postgraduate medical specialization, the problem of successful treatment of new infectious diseases can be solved, and future epidemics and pandemics be prevented.

BBC NEWS

Killer flu recreated in the lab:
Scientists have shown that tiny changes to modern flu viruses
could render them as deadly as the 1918 strain which killed millions

BBC News, 7 October 2004, 05:02 GMT 06:02 UK
http://news.bbc.co.uk/2/hi/health/3719990.stm

A US team added two genes from a sample of the 1918 virus to a modern strain known to have no effect on mice. Animals exposed to this composite were dying within days of symptoms similar to those found in human victims of the 1918 pandemic. The research is published in the journal Nature.

The work of the US team, lead by Dr Yoshihiro Kawaoka of the University of Wisconsin, was carried out under the tightest security. Experts focused on two genes thought to play a key role in the infection process. One controls production of a spike-like molecule called haemagglutinin (HA), believed to be used by the flu virus to attach itself to the cells it is about to infect.

Previous research published earlier this year in the journal Science identified the HA gene as being the crucial element which made the 1918 virus so deadly - and the latest work appears to confirm this. Post mortems on mice injected in the nose with the composite virus showed that it had rampaged through their lungs, producing inflammation and haemorrhaging. The researchers stress the experiment is conclusive for lab mice, and not humans.

Better monitoring

But they say that their work may lead to better ways to assess the potential danger of emerging flu viruses. Writing in Nature, the researchers say: "Once the properties of the (1918) HA gene that gave rise to its lethal infectivity are better understood, it should be possible to devise effective control measures and to improve global surveillance networks for influenza viruses that pose the greatest threat to humans as well as other animal species."

Scientists believe the 1918 virus leapt to humans by mutating from bird flu, possibly after passing through pigs, which are able to harbour both human and avian viruses and thus allow them to swap genes as the viruses reproduce. For that reason, experts are deeply concerned that the avian flu that has broken out in poultry flocks in parts of south-east Asia may acquire genes that will make it highly infectious as well as lethal for humans.

Professor John Oxford, an expert in virology at Queen Mary College London, told BBC News Online the latest research underlined just what a threat all flu viruses potentially posed. He said: "It is not a big difference at all between a virus that kills 15m people and one that does not kill anyone at all. "The lesson is not to be complacent about anything to do with flu. Every flu virus must be carrying baggage that could potentially harm us, and we would be well advised not to ignore them."

Many deaths

The 1918 "Spanish" flu pandemic is estimated to have infected up to one billion people - half the world's population at the time. The virus killed more people than any other single outbreak of disease, surpassing even the Black Death of the Middle Ages.

Although it probably originated in the Far East, it was dubbed "Spanish" flu because the press in Spain - not being involved in World War I - were the first to report extensively on its impact. The virus caused three waves of disease. The second of these, between September and December 1918, resulting in the heaviest loss of life.

It is thought that the virus may have played a role in ending World War I as soldiers were too sick to fight, and by that stage more men on both sides died of flu than were killed by weapons. Although most people who were infected with the virus recovered within a week following bed rest, some died within 24 hours of infection.

Zwei Killervirus-Proben verschwunden

Spiegel, 16 April 2005, 10.32 Uhr
https://www.spiegel.de/wissenschaft/mensch/seuchengefahr-zwei-killervirus-proben-verschwunden-a-351566.html

Einige der Proben mit tödlichen Grippeviren, die ein US-Labor in alle Welt verschickt hat, sind möglicherweise verloren gegangen. Der Verbleib von mindestens zwei Behältern mit dem gefährlichen Erreger der Asiatischen Grippe ist derzeit unbekannt.

Genf - Ein US-Labor hatte über mehrere Monate tödliche Grippeviren an 3747 Labore verschickt und damit vor einigen Tagen weltweit Alarm ausgelöst. Nun stellt sich heraus, dass manche der hoch gefährlichen Proben mit dem Erreger der Asiatischen Grippe möglicherweise verschwunden sind. Der Verbleib von zwei Lieferungen nach Mexiko und in den Libanon sei ungeklärt, teilte die Weltgesundheitsorganisation (WHO) mit.

"Wir wissen nicht, wann diese Behälter verschickt werden sollten und auch nicht, wo sie verloren gegangen sein könnten", sagte WHO-Grippeexperte Klaus Stöhr in Genf. "Die Ermittlungen, was zwischen dem Versand und der nie erfolgten Ankunft geschehen ist, steht ganz oben auf unserer Liste." Derzeit bestehe aber auch die Möglichkeit, dass die Proben nie verschickt worden seien.

Das tödliche Virus war von der Firma Meridian Bioscience mit Sitz in Cincinnati (US-Bundesstaat Ohio) an Labors in 18 Ländern verschickt worden, die meisten davon in den USA. Das Unternehmen hatte den Auftrag, eine Influenza-A-Probe für Testkits herzustellen, mit denen Labore interne Qualitätskontrollen ihrer Arbeit durchführen.

Statt der vorgesehenen H3N2-Viren wählte Meridian Bioscience aber den tödlichen H2N2-Erreger aus, der 1957 die sogenannte Asiatische Grippe ausgelöst hat. Zwischen einer und vier Millionen Menschen kamen bei der Pandemie ums Leben. Da das hochansteckende H2N2-Virus seit Ende der sechziger Jahre als ausgerottet gilt und nur noch in den Kühlschränken von Labors existierte, ist es heute besonders gefährlich: Zumindest nach 1968 geborene Menschen besitzen keinen Immunschutz mehr gegen den Erreger.

Die Besorgnis, dass erneut eine verheerende Pandemie ausbrechen könnte, wird laut Stöhr jedoch von der Tatsache gedämpft, dass die Viren als gefriergetrocknetes Pulver versandt worden seien. Die Erreger reagierten äußerst empfindlich auf Hitze und ultraviolettes Licht und würden schon bei Zimmertemperatur schnell unschädlich werden.

"Falls eine der Behälter im Müll landen und zerbrechen würde, wären die Viren mit Sicherheit schnell zerstört", sagte Stöhr. Sollten aber Menschen eine solche Probe finden, sähe die Sache anders aus. Die libanesischen und mexikanischen Behörden erklärten unterdessen, die Proben seien niemals in Laboratorien ihrer Länder eingetroffen.

Bis zum heutigen Samstag sollten laut WHO alle Proben, die an Labore außerhalb der USA verschickt wurden, vernichtet sein. Die sechs deutschen Empfänger des Testkits hätten dies nach eigenen Angaben bereits erledigt, berichtete das Robert-Koch-Institut aus Berlin.

US-Forscher beleben altes Killervirus

Spiegel, 2 Oktober 2005, 20:16 h
https://www.spiegel.de/wissenschaft/mensch/kampf-gegen-vogelgrippe-us-forscher-beleben-altes-killervirus-a-378217.html

US-Forscher haben in einem Militärlabor den extrem gefährlichen Erreger der Spanischen Grippe rekonstruiert. Die Ergebnisse, die jetzt erstmals detailliert veröffentlicht werden, sollen eine drohende Vogelgrippe-Pandemie verhindern helfen. Kritiker warnen jedoch vor der Gefahr eines Ausbruchs.

Was alle Seuchen der Geschichte nicht geschafft hatten, gelang der Spanischen Grippe binnen weniger Monate. 1918 tötete die Pandemie 20 bis 50 Millionen Menschen, mehr als jede andere Krankheit zuvor. Allein in den USA gab es 550.000 Tote. Die Infizierten litten unter hohem Fieber, ihre Lungen entzündeten sich. Innerhalb weniger Tage ertranken die Opfer an ihrer eigenen Flüssigkeit.

Ein US-Forscherteam hat das Virus in jahrelanger Arbeit seit 1995 nachgebaut. Die Ergebnisse des Experiments, das bereits im Oktober 2003 publik wurde, erscheinen jetzt erstmals detailliert in den Fachblättern "Nature" und "Science".

Die Erkenntnisse der Wissenschaftler um Jeffrey Taubenberger vom Institute of Pathology der US-Armee legen nahe, dass das von ihnen rekonstruierte Virus H1N1 von einem Vogelgrippe-Virus abstammte und die Fähigkeit entwickelte, den Menschen anzufallen. Genau diese Entwicklung befürchten die Experten derzeit in Asien: Der dort grassierende Erreger H5N1 könnte mutieren oder sich mit einem menschlichen Grippevirus vermischen und dann eine weltweite Epidemie auslösen.

Uno befürchtet bis zu 150 Millionen Tote

Erst vergangene Woche hat die Uno vor den schrecklichen Auswirkungen einer solchen Seuche gewarnt, die die Spanische Grippe noch um ein Mehrfaches übertreffen könnte. Bis zu 150 Millionen Tote seien möglich, sagte David Nabarro, der neue Uno-Chefkoordinator im Kampf gegen die Vogelgrippe. => https://www.spiegel.de/wissenschaft/mensch/grippe-pandemie-uno-rechnet-mit-bis-zu-150-millionen-toten-a-377590.html

Um das vor acht Jahrzehnten verschwundene Virus der Spanischen Grippe wieder zum Leben zu erwecken, entnahm Taubenbergers Team mehreren Leichen Gewebeproben, unter anderem einer Frau, die 1918 im Dauerfrostboden von Alaska beerdigt worden war. Zusätzlich verwendeten sie in Formalin konserviertes Lungengewebe von anderen Opfern der Spanischen Grippe.

In einem komplizierten Verfahren gelang es den Wissenschaftlern, den genetischen Code des extrem aggressiven H1N1-Virus zu identifizieren und es im Labor zu reproduzieren. Die Mediziner stellten mit dem genetischen Code virusartige Genstränge her, sogenannte Plasmide. Diese wiederum wurden menschlichen Nierenzellen eingepflanzt.

"Sobald das Plasmid in der Zelle ist, baut sich das Virus von selbst auf", sagt Terrence Tumpey von der US-Behörde Centers for Disease Control. "Es dauert nur wenige Tage." Man habe so die biologischen Eigenheiten des Virus erforscht, die seine extrem tödliche Wirkung ausgelöst haben.

Die Forscher testeten den Erreger der Spanischen Grippe auch an Mäusen, Hühner-Embryos und menschlichen Lungenzellen. Die infizierten Mäuse und Embryonen starben binnen weniger Tage.

1918 war H1N1 zunächst in Vögeln aufgetaucht, wie auch jetzt das H5N1-Virus. "Unsere Bemühungen, die Spanische Grippe zu verstehen, haben eine aktuelle Dringlichkeit erhalten", betont Forschungsleiter Taubenberger.

Ein Gen, das die Forscher für die besondere Aggressivität des Virus verantwortlich machen, ist in einem Protein an dessen Oberfläche enthalten: Hämaglutinin, das das Andocken an eine Zelle ermöglicht. Wenn es gelänge, genau diesen Mechanismus zu blockieren, könnte das zur Entwicklung wirksamer Gegenmittel auch gegen H5N1 beitragen, sagte Tumpey.

Kritiker zweifeln an Immunschutz

Die Mediziner stellten außerdem fest, dass moderne Medikamente wirksam gegen den alten Erreger eingesetzt werden könnten. Das Risiko, das von dem wiedererweckten Virus ausgehe, ist den US-Gesundheitsbehörden zufolge minimal. Nach der Epidemie hätten die Menschen weltweit Antikörper entwickelt, die bis heute vorhanden sein sollen.

Genau das bezweifeln Kritiker allerdings. Schon Oktober 2003 hielten Experten die Rekonstruktion des H1N1-Virus durch Taubenberger für gefährlich. Ihr Argument: Von den Zeitgenossen der Spanischen Grippe lebe heute kaum noch jemand. Die Menschheit verfüge deshalb über keinen wirksamen Immunschutz. Ein versehentlicher Ausbruch des Virus könne daher verheerende Folgen haben.

Die Wahrheit dürfte in der Mitte liegen. Das H1N1-Virus sei Bestandteil des Impfstoffs, der jährlich von der Weltgesundheitsorganistation neu entwickelt und auch in Deutschland verabreicht werde, erklärte Georg Pauli vom Berliner Robert-Koch-Institut im Gespräch mit SPIEGEL ONLINE. "Insofern besteht ein gewisser Schutz gegen den H1N1-Erreger", so der Virologe. "Wie weit dieser Schutz reicht, ist allerdings nicht klar."

H5N1 zirkuliert seit Jahrzehnten in vielen Teilen der Welt. Der heutige Impfstoff basiert auf diesem modernen Virus, das sich aber vom ursprünglichen Erreger von 1918 unterscheiden dürfte. "Das Virus kann nur in einem bestimmten Rahmen mutieren", sagt Pauli. "Aber eine Voraussage über die Wirksamkeit des heutigen Impfstoffes gegen das alte Virus würde ich nicht treffen wollen."

Ängste vor einer versehentlichen Freisetzung von H1N1 sind nicht völlig unbegründet. Erst im April dieses Jahres hat ein US-Labor Proben des H2N2-Virus, das 1957 die Asiatische Grippe mit bis zu vier Millionen Toten auslöste, an über 3700 Labore in aller Welt verschickt.

https://www.spiegel.de/wissenschaft/mensch/seuchengefahr-zwei-killervirus-proben-verschwunden-a-351566.html

Da der hoch ansteckende Erreger seit Ende der sechziger Jahre nur noch in den Kühlschränken von Labors existierte, ist er heute besonders gefährlich. "Gegen dieses Virus bestünde überhaupt kein ausreichender Immunschutz mehr", sagt Pauli.

Trotz der Bedenken speisten die Forscher um Taubenberger die genetischen Informationen des H1N1-Erregers in die GenBank ein, einer öffentlichen Datenbank der amerikanischen National Institutes of Health. "Wir haben sorgfältig überlegt, ob wir unsere Ergebnisse veröffentlichen sollen", sagt er. "Die Chancen für den Schutz der Öffentlichkeit vor einer Pandemie überwiegen die Risiken, die die Arbeit mit dem Virus mit sich bringt."

(57) **ABSTRACT**

The present invention relates, in general, to attenuated swine influenza viruses having an impaired ability to antagonize the cellular interferon (IFN) response, and the use of such attenuated viruses in vaccine and pharmaceutical formulations. In particular, the invention relates to attenuated swine influenza viruses having modifications to a swine NS1 gene that diminish or eliminate the ability of the NS1 gene product to antagonize the cellular IFN response. These viruses replicate in vivo, but demonstrate decreased replication, virulence and increased attenuation, and therefore are well suited for use in live virus vaccines, and pharmaceutical formulations.

Abstract

The present invention relates, in general, to attenuated swine influenza viruses having an impaired ability to antagonize the cellular interferon (IFN) response, and the use of such attenuated viruses in vaccine and pharmaceutical formulations.

In particular, the invention relates to attenuated swine influenza viruses having modifications to a swine NS1 gene that diminish or eliminate the ability of the NS1 gene product to antagonize the cellular IFN response. These viruses replicate in vivo, but demonstrate decreased replication, virulence and increased attenuation, and therefore are well suited for use in live virus vaccines, and pharmaceutical formulations.

SWINE FLU

Swine Flu Epidemic/ H1N1 Vaccine Deaths and Injuries

Swine Flu, 6 March 2009
http://vaccineriskawareness.com/swine-flu/

Now in April we are hearing of dozens of cases of people in Mexico, dying of 'swine flu'. I think the Baxter accident and the swine flu are related.

It's emerged that virulent H5N1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the H5N1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, unexpectedly, ferrets inoculated with the sample had died. It turned out the sample contained live H5N1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen."

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences. While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people.

The Frederick News-Post

Justin M. Palk

Fort Detrick disease samples may be missing

The Frederick News-Post, 22 April 2009
https://web.archive.org/web/20090424100741/https://www.fredericknewspost.com/sections/news/display.htm?StoryID=89293

Army criminal investigators are looking into the possibility that disease samples are missing from biolabs at Fort Detrick.

As first reported in today's edition of The Frederick News-Post by columnist Katherine Heerbrandt, the investigators are from the U.S. Army Criminal Investigation Division unit at Fort Meade.

Chad Jones, spokesman for Fort Meade, said CID is investigating the possibility of missing virus samples from the U.S. Army Medical Research Institute of Infectious Diseases.

He said the only other detail he could provide is that the investigation is ongoing.

Fort Detrick does not have its own CID office, Jones said, which is why Fort Meade's CID was brought in.

Jones said he could not comment on when the investigation started.

CID is responsible for investigating crimes where the Army is, or may be, a party of interest, according to the U.S. Army Criminal Investigation Command website.

USAMRIID is the Army's top biodefense lab, where researchers study pathogens including Ebola, anthrax and plague.

In February, USAMRIID halted all its research into these and other diseases, known as "select agents" following the discovery of virus samples that weren't listed in its inventory.

The institute's commander, Col. John Skvorak, ordered research halted while workers conducted a complete inventory of the institute's select agents.

That inventory is nearly completed, though the exact end date isn't known yet, said Caree Vander Linden, USAMRIID spokeswoman.

Vander Linden said she didn't know about the CID investigation and referred questions to the CID's head public affairs office.

There is no indication whether the CID investigation is connected to USAMRIID's re-inventorying of its select agent stocks.

Larry Shaughnessy

Army: 3 vials of virus samples missing from Maryland facility

CNN, 22 April 2009.
https://edition.cnn.com/2009/US/04/22/missing.virus.sample/

Washington (CNN) – Missing vials of a potentially dangerous virus have prompted an Army investigation into the disappearance from a lab in Maryland.

The Army's Criminal Investigation Command agents have been visiting Fort Detrick in Frederick, Maryland, to investigate the disappearance of the vials. Christopher Grey, spokesman for the command, said this latest investigation has found "no evidence of criminal activity."

The vials contained samples of Venezuelan Equine Encephalitis, a virus that sickens horses and can be spread to humans by mosquitoes. In 97 percent of cases, humans with the virus suffer flu-like symptoms, but it can be deadly in about 1 out of 100 cases, according to Caree Vander Linden, a spokeswoman for the Army's Medical Research Institute of Infectious Diseases. There is an effective vaccine for the disease and there hasn't been an outbreak in the United States since 1971.

The vials had been at the research institute's facility at Fort Detrick, home of the Army's top biological research facility, for more than a decade. The three missing vials were among thousands of vials that were under the control of a senior scientist who retired in 2004. When another Fort Detrick scientist recently inventoried the retired scientist's biological samples, he discovered that the three vials of the virus were missing. The original scientist's records about his vials dated back to the days of paper-and-pen inventories.

During the investigation, the retired scientist and another former Fort Detrick researcher cooperated with investigating agents and, according to Vander Linden, they came back to the facility to help look for the vials.

Vander Linden said the investigators know that several years ago an entire freezer full of biological samples broke down and all the samples had to be safely destroyed. But a complete inventory of what was in the freezer was not done before the samples were destroyed. Vander Linden said there's a "strong possibility" the vials were in that freezer and destroyed, but that isn't known for sure.

This investigation comes two months after all research at the research institute facility at Fort Detrick was halted for a complete computer-based inventory of all disease samples at the fort. That inventory is expected to be complete before summer and may help solve the mystery of the three missing vials, officials said.

NEWWORLDLIBERTY

Swine Flu Attack Likely a Beta Test

New World Liberty, 25 April 2009

https://web.archive.org/web/20090427222530/https://newworldliberty.wordpress.com/

The latest bioterrorism attack by the New World Order is likely a beta test. Yes, it is a bioterrorism attack. It was a hybrid strain created from human, swine, and bird flu from North America, Europe, and Asia. It was created in a laboratory. This doesn't happen in nature.

Baxter was caught shipping a weaponized avian bird flu mixed strain in their vaccines last month in Europe. Again, this is proof that this deadly virus was created in a laboratory because they did exactly that last month. Bayer was caught shipping HIV in their drugs in the 80s. Both of these events are published in mainstream newspapers. You can use Google like everyone else to find them.

I predicted this event last month in my documented and linked article when Baxter was caught. If Baxter was trying to do this, they weren't going to stop trying, especially when Baxter wasn't even prosecuted for the crime, and the television news was completely silent about it.

It seems someone wasn't caught this time before they were able to make delivery of the virus. Not that anyone would be prosecuted for bioterrorism. They weren't prosecuted the previous numerous times where they were caught.

This latest flu hasn't been widespread and not that deadly. It seems to be just a beta test and not the real release to drastically reduce the population of the world.

Yes, the ruling elite want to reduce the population of the world. They write about it in their books, in their think tank documents, in government documents, and at their conferences. You won't hear about it on television news because they're part of the mainstream media trust, along with AP and Reuters, which are all owned by the same people.

They add the industrial waste and active ingredient of rat poison, known as fluoride, in your water, causing your brain, liver, and bones to rot and decay. They add mercury, which is as toxic as lead or arsenic, to the vaccines as a preservative, causing autism and sudden infant death syndrome, among several other things. Yes, the government hates you and wants to kill you. Government loves war and death.

Before any scientist does anything very drastic they always do a beta test. They are studying several different things such as how far it spreads and how fast. They are studying if it mutates. They are studying if they'll get away with the crime.

Mexico seems like an ideal distribution point since they know it would spread to the United States. There are less safeguards in Mexico than the United States, but the United States is the primary target. Americans have a Second Amendment right, which makes Americans a big threat to the New World Order and the ruling elite's power.

It is your duty not to make the latest beta test a success by screaming about it. Scream about it to your elected representatives and to the media. Demand justice.

The sick part about this is that they are using vaccines to spread the virus. The cure for the bio-terrorism attack is the method of delivery so take vaccines at your own risk. Take a rat or your local politician to the doctor with you to beta test the vaccine before you take it.

Just be aware they may switch the delivery mechanism to something like food, water, or aerial spraying to drastically reduce the population. I'm not an expert, but I believe injections are the most effective delivery mechanism for spreading such a biological weapon and is why they were caught doing just that.

The real test will be much more deadly and much more widespread. They'll bring in martial law when it happens and take the rest of our rights away if we happen to survive a large-scale bioterror attack.

This is why you must awaken everybody that the government and big corporations are the terrorists, not Islamic brown people hiding in caves. Switch the word "Islamic" with the word "Jew", and you'll understand how Hitler came to power in a democratic society. I can't believe people haven't caught onto the race baiting by the national socialists running this nation and the world. You're bigots and don't even realize it. You're a bunch of Nazis and don't even realize it.

This is why you must demand justice for these crimes against humanity by the evil terrorist tyrants in power. This is a big deal. Your life and the lives of your friends, family, and children depend on fighting it.

You might want to question who is making a profit on this as well. I believe Obama even own shares of the company who makes the drug to treat this virus. Illinois-based Baxter working on swine flu vaccine.

This is not a hoax. Dead bodies are not a hoax. What is happening now is not a hoax. It is fact. What Baxter and Bayer did is fact. If you deny these facts, I can't help you. You're beyond help.

Paul Joseph Watson

Medical Director: Swine Flu Was "Cultured in a Laboratory"

Info Wars, 25 April 2009

https://web.archive.org/web/20090427130805/https://www.infowars.com/medical-director-swine-flu-was-cultured-in-a-laboratory/

Editor's note: On Friday, NPR reported that the deadly swine flu "combines genetic material from pigs, birds and humans in a way researchers have not seen before," thus leading us to suspect it was cooked up in a lab.

Swine flu panic is spreading in Mexico and soldiers are patrolling the streets after it was confirmed that human to human transmission is occurring and that the virus is a brand-new strain which is seemingly affecting young, healthy people the worst. Questions about the source of the outbreak are also being asked after a public health official said that the virus was "cultured in a laboratory".

"This strain of swine influenza that's been *cultured in a laboratory*is something that's not been seen anywhere actually in the United States and the world, so this is actually a new strain of influenza that's been identified," said Dr. John Carlo, Dallas Co. Medical Director (video clip here).

Was this a slip-up or an admission that this new super-strain of swine influenza was deliberately *cultured in a laboratory* and released?

Alarming reports are now filtering in about people catching the illness who have had no contact with pigs whatsoever. These include a man and his daughter in San Diego County, a 41-year-old woman in Imperial County and two teenagers in San Antonio, Texas. In fact, in all U.S. cases, the victims had no contact with any pigs.

Dr. Wilma Wooten, San Diego County's public health officer, told KPBS "We have had person-to-person spread with the father and the daughter," says Wooten, "And also with the two teenagers in Texas, they were in the same school. So that also indicates person-to-person transfer." Dr. Wooten says it's unclear how people were exposed to swine flu. She says "none of the patients have had any contact with pigs," according to the report.

Although the situation in the U.S. looks under control, panic is spreading in Mexico, where 800 cases of pneumonia in the capital alone are suspected to be related to the swine flu and the virus has hit young and healthy people, which is very rare with an flu outbreak. Despite the danger of a pandemic, the U.S. border with Mexico remains open.

"Mexico has shut schools and museums and canceled hundreds of public events in its sprawling, overcrowded capital of 20 million people to try to prevent further infections," reports Reuters.

"My level of concern is significant," said Dr. Martin Fenstersheib, the health officer for Santa Clara County. "We have a novel virus, a brand-new strain that's spreading human to human, and we are also seeing a virulent strain in Mexico that seems to be related. We certainly have concerns for this escalating."

The WHO insists that the outbreak has "pandemic potential" and has been stockpiling supplies of Tamiflu, known generically as oseltamivir, a pill that can both treat flu and prevent infection, according to officials.

As we previously highlighted, those that have a stake in the Tamiflu vaccine include top globalists and BIlderberg members like George Shultz, Lodewijk J.R. de Vink and former Secretary of Defense

Donald Rumsfeld. => [Steve Watson. Killing Two Birds with One Tamiflu Stone. Avian Flu: Precedent for Martial Law and Globalist money spinner rolled into one. – Info Wars, 8 November 2005].

Indeed, Rumsfeld himself played a key role in hyping an outbreak of swine flu back in the 1976 when he urged the entire country to get vaccinated. Many batches of the vaccine were contaminated, resulting in hundreds of sick people and 52 fatalities.

The fact that the properties of the strain are completely new, that the virus is spreading from people to people, and that the young and healthy are being hit worst, has disturbing parallels to the deadly 1918 pandemic that killed millions.

It is unclear as to why, if the virus is a brand new strain, that public health officials are so confident programs of mass vaccination, which are already being prepared, would necessarily be effective.

It certainly wouldn't be the first time that deadly flu viruses have been concocted in labs and then dispatched with the intention of creating a pandemic.

When the story first broke last month, Czech newspapers questioned if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

Since the probability of mixing a live virus biological weapon with vaccine material by accident is virtually impossible, this leaves no other explanation than that the contamination was a deliberate attempt to weaponize the H5N1 virus to its most potent extreme and distribute it via conventional flu vaccines to the population who would then infect others to a devastating degree as the disease went airborne.

However, this is not the first time that vaccine companies have been caught distributing vaccines contaminated with deadly viruses.

In 2006 it was revealed that Bayer Corporation had discovered that their injection drug, which was used by hemophiliacs, was contaminated with the HIV virus. Internal documents prove that after they positively knew that the drug was contaminated, they took it off the U.S. market only to dump it on the European, Asian and Latin American markets, knowingly exposing thousands, most of them children, to the live HIV virus. Government officials in France went to prison for allowing the drug to be distributed. The documents show that the FDA colluded with Bayer to cover-up the scandal and allowed the deadly drug to be distributed globally. No Bayer executives ever faced arrest or prosecution in the United States.

In the UK, a 2007 outbreak of foot and mouth disease that put Britain on high alert has been originated from a government laboratory which is shared with an American pharmaceutical company, mirroring the deadly outbreak of 2001, which was also deliberately released.

As we reported yesterday, last time there was a significant outbreak of a new form of swine flu in the U.S. it originated at the army base at Fort Dix, New Jersey.

Swine-flu outbreak could be linked to Smithfield factory farms

Grist, 26 April 2009
https://grist.org/article/2009-04-25-swine-flu-smithfield/

One flu east, one flu west.

The outbreak of a new flu strain – a nasty mash-up of swine, avian, and human viruses – has infected 1,000 people in Mexico and the U.S., killing 68. The World Health Organization warned Saturday that the outbreak could reach global pandemic levels.

Is Smithfield Foods, the world's largest pork packer and hog producer, linked to the outbreak? Smithfield operates massive hog-raising operations Perote, Mexico, in the state of Vera Cruz, where the outbreak originated. The operations, grouped under a Smithfield subsidiary called Granjas Carroll, raise 950,000 hogs per year, according to the company Web site.

On Friday, the U.S. disease-tracking blog Biosurveillance published a timeline of the outbreak containing this nugget, dated April 6 (*major tip of the hat to Paula Hay, who alerted me to the Smithfield link on the Comfood listserv and has written about it on her blog, Peak Oil Entrepreneur)*:

Residents [of Perote] believed the outbreak had been caused by contamination from pig breeding farms located in the area. They believed that the farms, operated by Granjas Carroll, polluted the atmosphere and local water bodies, which in turn led to the disease outbreak. According to residents, the company denied responsibility for the outbreak and attributed the cases to "flu." However, a municipal health official stated that preliminary investigations indicated that the disease vector was a type of fly that reproduces in pig waste and that the outbreak was linked to the pig farms. It was unclear whether health officials had identified a suspected pathogen responsible for this outbreak.

From what I can tell, the possible link to Smithfield has not been reported in the U.S. press. Searches of Google News and the websites of the *New York Times, Washington Post*, and *Wall Street Journal* all came up empty.

The link is being made in the Mexican media, however. "Granjas Carroll, causa de epidemia en La Gloria," declared a headline in the Vera Cruz-based paper *La Marcha.* No need to translate that, except to point out that La Gloria is the village where the outbreak seems to have started. Judging from the article, Mexican authorities treat hog CAFOs with just as much if not more indulgence than their peers north of the border, to the detriment of surrounding communities and the general public health. Get this:

De acuerdo con uno de los habitantes de la comunidad, Eli Ferrer Cortés, los desechos fecales y orgánicos que produce Granjas Carroll no son tratados adecuadamente, lo que genera contaminación del agua y del viento en la region.

=> https://web.archive.org/web/20090430042243/http://www.marcha.com.mx/resumen.php?id=2128

My rough translation: According to one community resident, the organic and fecal waste produced by Granjas Carrol isn't adequately treated, creating water and air pollution in the region. I witnessed – and smelled – the same thing in Hardin County, Iowa, a couple of years ago, another area marked by intensive industrial hog production. The article goes on to say that area residents have long complained of "fetid odors" in the air and water, and swarms of flies hovering around waste lagoons. Like their counterparts who live in CAFO-heavy U.S. areas, they also complain of respiratory ailments. Now, with 30 percent of the area's residents now infected with the virulent flu bug, people are demanding that state and federal authorities inspect hog operations there. So far, reports *La Marcha,* the response has been: *nada.* => http://www.jornada.unam.mx/2009/04/06/index.php?section=estados&article=030n1est

The Mexico City Daily *La Jornada* has also made the link. According to the newspaper, the Mexican health agency IMSS has acknowledged that the orginal carrier for the flu could be the "clouds of flies" that multiply in the Smithfield subsidiary's manure lagoons. => https://web.archive.org/web/20090410023226/http://www.jornada.unam.mx/2009/04/06/index.php?section=estados&article=030n1est

I'll be in touch with contacts in Mexico as this story develops – and I'll be curious to see whether the U.S. media explores the link with Smithfield's Mexico operation.

Note: In the original version of this post, I had called production at Granjas Carroll "nearly equal to Smithfield's total U.S. production." I had been confusing total production at Granjas Carroll – 950,000 hogs produced in fiscal 2008 – with the number of sows, or breeding pigs, kept by Smithfield in the United States. According to my source – "Concentration of Ag Markets, 2007" (PDF) by Hendrickson and Heffernan – Smithfield keeps 1.2 million sows. Actual hog production is much larger – thus Smithfield's total U.S. hog production is much larger than Granjas Carroll's. I regret the error.

ONLINE JOURNAL™

Wayne Madsen

New swine flu feared to be weaponized strain

Online Journal, 27 April 2009, 00:12
http://onlinejournal.com/artman/publish/article_4631.shtml

According to two mainstream media journalists, one in Mexico City and the other in Jakarta, who spoke to WMR on background, they are convinced that the current outbreak of a new strain of swine flu in Mexico and some parts of the United States is the result of the introduction of a human-engineered pathogen that could result in a widespread global pandemic, with potentially catastrophic consequences for domestic and international travel and commerce.

The journalists have been told by top officials of the United Nations and the World Health Organization (WHO) about the grave dangers posed by the new and deadly swine flu strain, known as A-H1N1. This flu, never before seen by scientists, has already killed up to 68 people in Mexico and has forced the cancellation of public events, including sports matches and concerts, and the closure of schools, libraries, and museums. Eight cases have been reported in Texas and California. Doctors are examining several students at a Queens high school in New York who displayed symptoms similar to those experienced by swine flu patients in Mexico.

Our Mexico City source said a top scientist for the United Nations, who has examined the outbreak of the deadly Ebola virus in Africa, as well as HIV/AIDS victims, concluded that H1N1 possesses certain transmission "vectors" that suggest that the new flu strain has been genetically-manufactured as a military biological warfare weapon. The UN expert believes that Ebola, HIV/AIDS, and the current A-H1N1 swine flu virus are biological warfare agents.

Past swine flu outbreaks have been spread from pigs to humans, who then passed the flu on to other humans. However, with A-H1N1, there have been no reported infections of pigs. In fact, according to the Centers for Disease Control and Prevention (CDC), A-H1N1 has gene segments from North American swine, bird and human flu strains and a segment from Eurasian swine flu. Costa Rica, Brazil, and Peru have issued alerts to check all incoming passengers from Mexico at border crossings, airports, and seaports for symptoms of the swine flu.

WHO is convening an emergency session of its top medical experts in Geneva and is set to declare H1N1 a "public health event of international concern." It is reported that WHO will recommend travel restrictions to and from areas where the flu has been reported, including Mexico City and the states of Mexico, Hidalgo, San Luis PotosÃ- and Oaxaca.

Our Jakarta source said WHO officials are afraid that the presence of gene segments from dreaded H5N1 bird flu in the A-H1N1 swine flu strain could mean that the new swine flu strain was engineered to "jump species."

WMR has been informed that the CDC and U.S. Army dug up the body of an Inuit woman who died in 1918 in Brevig Mission, Alaska from an outbreak of Spanish flu. The influenza pandemic

that year killed up to 100 million people worldwide in an 18-month period. Brevig Mission saw 72 of its 80 residents die within five days, the worst case recorded anywhere in the world. WMR has been told the genetic material recovered by the U.S. government from the corpse of the Inuit woman provided the basis for the development of the H5N1, or bird (avian), flu strain at the U.S. Army Medical Institute of Infectious Diseases (USAMRIID) laboratory at Fort Detrick, Maryland, the point of origin for the Ames strain of anthrax used in the 2001 bio-war attacks against the U.S. Congress and the media.

The fear in Asia is that if the A-H1N1 pandemic spreads to the United States, travel to and from the country will be all but shut down.

The following are the symptoms associated with A-H1N1:

· cough
· fever
· sore throat
· shortness of breath
· muscle and joint pain

The drugs Tamiflu and Relenza are seen as the most effective against A-H1N1.

Natural News.com
Natural Health, Natural Living, Natural News

Mark Adams

As Swine Flu Spreads, Conspiracy Theories of Laboratory Origins Abound

Natural News, 27 April 2009
https://www.naturalnews.com/026141.html

(NaturalNews) Perhaps due to the genetic makeup of the fast-spreading H1N1 strain of influenza – which includes genetic elements from bird flu, swine flu and human flu spanning three continents – there is considerable speculation that the origins of this virus are man-made.

It's not an unreasonable question to ask: Could world governments, spooked by the prospect of radical climate change caused by over-population of the planet, have assembled a super-secret task force to engineer and distribute a super virulent strain of influenza designed to "correct" the human population (and institute global Martial Law)?

Technically, it's possible. The U.S. military, all by itself, has the know-how to engineer and unleash such a virus. That doesn't mean they've done so, however. It would be an astonishing leap into crimes against humanity to intentionally unleash such a biological weapon into the wild.

Then again, governments of the world have routinely engaged in crimes against humanity, haven't they? The U.S., for example, dropped nuclear bombs on civilian populations in Japan. Israel rained white phosphorous on Palestinians, Hitler exterminated countless Jews, and Americans fired millions of rounds of depleted uranium rounds into targets in Iraq and Afghanistan. Unleashing a viral biological weapon in Mexico City is no great leap beyond what governments have already done to achieve their goals.

Throughout human history, virtually all the great crimes against humanity have been carried out by governments -- mostly in the name of peace, prosperity and security, by the way. So let's be clear about one thing: Governments are certainly capable of doing this if properly motivated. Let there be no question about that.

Is there any hard evidence of laboratory origins?

As of this moment, I have not personally seen any conclusive evidence of laboratory origins for this H1N1 swine flu. I am open to the possibility that new evidence may emerge in this direction, however, and I am suspicious of the genetic makeup of the virus as one possible indicator of its origins.

I am not a medical specialist in the area of infectious disease, but I have studied microbiology, genetics and a considerable amount of material on pandemics. What seems suspicious to me is the hybrid origin of the viral fragments found in H1N1 influenza. According to reports in the mainstream media (which has no reason to lie about this particular detail), this strain of influenza contains viral code fragments from:

- Human influenza
- Bird Flu from North America
- Swine flu from Europe
- Swine flu from Asia

This is rather astonishing to realize, because for this to have been a natural combination of viral fragments, it means an infected bird from North America would have had to infect pigs in Europe, then be re-infected by those some pigs with an unlikely cross-species mutation that allowed the bird

to carry it again, then that bird would have had to fly to Asia and infected pigs there, and those Asian pigs then mutated the virus once again (while preserving the European swine and bird flu elements) to become human transmittable, and then a human would have had to catch that virus from the Asian pigs – in Mexico! – and spread it to others. (This isn't the only explanation of how it could have happened, but it is one scenario that gives you an idea of the complexity of such a thing happening).

Now, on a common-sense level, what is the likelihood of such a combination of seemingly unlikely, trans-continental events taking place? At first glance, without the benefit of additional laboratory analysis, it seems extremely unlikely that this could have happened "naturally," without human intervention. It's not outside the realm of possibility, of course, but it seems exceedingly remote that such events happened without some human encouragement.

This is perhaps why the internet is smoking hot with talk of swine flu conspiracy theories. Alex Jones is, of course, covering the issue in articles like this one: =>
https://web.archive.org/web/20090427130805/http://www.infowars.com/medical-director-swine-flu-was-cultured-in-a-laboratory/

If the release of the virus was intentional, there are essentially two explanations for who might be behind it: 1) Governments attempting to reduce the human population, 2) Bio-terrorists attempting to kill lots of people. Or perhaps 3) Those two groups are one and the same!

Why we shouldn't dismiss the conspiracy theories outright

Many of the points made in conspiracy articles are well made, in fact: There is both a motive and a means for governments of the world to have played a role in the creation and transmission of this virus. Still, it doesn't mean they did, and NaturalNews will be cautious in reporting such conclusions until more evidence emerges.

There's no question about one aspect of the circulating conspiracy theories, however: If governments wanted to infect people with this bio-engineered swine flu, vaccines would be the best way to do it. It seems interesting that Mexico City health officials, in particular, leaped to a mass vaccination campaign in the midst of the swine flu outbreak even though no vaccines are yet available for swine flu!

…

Vaccinated doctors dead in days

Did you catch what was said here? As Dr. Yeny Gregoria Davila posted on the BBC website, vaccines were given to the medical personnel and those very same medical personnel were dead within six days. Thus, the vaccine is certainly not protecting these people from infection.

According to the conspiracy theories, these vaccines may indeed be the carrier of the virus. Injecting front-line medical personnel with the virus is the fastest way to spread it even further because medical workers interact with large numbers of immune-compromised people on a daily basis, including many people who tend to travel from far away to visit the hospital and then return to their distant towns, burros or villages in Mexico.

Furthermore, the true number of people infected or killed by the virus is being vastly underreported, according to these doctors. It's just like China's handling of SARS: The country was hesitant to admit the disease existed at all in order to avoid international embarrassment over its lackluster health policies.

As the WHO knows quite well, nations are universally reluctant to tell the truth about infectious disease. There's even a good reason why: Big Pharma usually attempts to acquire the virus early on, patent its particular genetic code, then manufacture expensive vaccines that it sells back to the stricken nation at a ridiculously-high price. This is how Big Pharma profits from a pandemic, turning human suffering into corporate profits.

Thus, it is actually in a nation's economic interests to avoid sharing viral strains with world health authorities because WHO routinely shares viral specimens with pharmaceutical companies. This is just one factor in a long list of factors that compel nations to lie about infectious disease outbreaks.

Even when it comes to pandemic outbreaks, *we are still dealing with layer upon layer* of commercially-motivated deception on the part of nations. That's why it's so important to figure out how to "*read between the lies*" of the mainstream media. …

ABS-CBN NEWS

Indonesian minister says swine flu could be man-made

ABS-CBN News, 28 April 2009, 03:22 PM
https://news.abs-cbn.com/world/04/28/09/indonesian-minister-says-swine-flu-could-be-man-made

Jakarta - Indonesian Heath Minister Siti Fadilah Supari said Tuesday the deadly swine flu virus could have been man-made, as she urged calm over its spread around the world..

The controversial minister did not elaborate but in the past she has said Western governments could be making and spreading viruses in the developing world to boost pharmaceutical companies' profits.

"I'm not sure whether the virus was genetically engineered but it's a possibility," she told reporters at a press conference called to reassure the public over the government's response to the swine flu threat.

No cases of the disease have been reported in Indonesia, the country worst hit by the bird flu virus which has killed about 250 people worldwide since 2003.

Indonesian authorities have increased body temperature scanners at airports and banned imports of live pigs and pork products, amid World Health Organisation (WHO) warnings of a pandemic.

Supari, a cardiologist, also claimed that the H1N1 strain of swine flu, which is believed to have killed more than 150 people in Mexico, could not survive in tropical countries like Indonesia.

"We have to be alert at all times although swine flu in Indonesia is not a cause for panic," she said.

"H1N1 survives in countries with four seasons. The type A H1N1 virus hopefully won't be able to sustain itself once it enters the tropical climate of Indonesia," she added.

The virus has been found in 11 countries including Mexico, the United States and Spain, while several other countries from Colombia to New Zealand are investigating suspected cases.

Supari said the health ministry had prepared 100 hospitals to handle swine flu cases should the disease enter Indonesia.

The minister has refused since 2006 to share all but a handful of Indonesia's bird flu virus samples with WHO researchers, saying the system is being abused by rich countries to develop profitable vaccines which poor countries must buy.

=> For more information about this topic see:
Chapter 5. Swine Flu may have Escaped from a Laboratory

Los Angeles Times

Lori Kozlowski

Is swine flu a conspiracy?

Los Angeles Times, 28 April 2009 12:44 PM PT
https://www.latimes.com/archives/blogs/booster-shots/story/2009-04-28/is-swine-flu-a-conspiracy

With so much worldwide panic and pressure surrounding swine flu, you had to guess that the conspiracy theorists would come out of the woodwork.

Everyone wants to find what pig was the original carrier. Everyone wants to know if the government is behind this. The FBI? The CIA? Is this is a great pandemic that was warned about by Nostradamus? Is Donald Rumsfeld secretly planning our demise to make money with Tamiflu? And who stands to gain?

As the news continues to break, and everyone wants to name a bad guy first, let's take a look at the theories swirling around the Interweb.

From Grist.org: Swine-flu outbreak could be linked to Smithfield factory farms
=> https://grist.org/article/2009-04-25-swine-flu-smithfield/

Is Smithfield Foods, the world's largest pork packer and hog producer, linked to the outbreak? Smithfield operates massive hog-raising operations Perote, Mexico, in the state of Vera Cruz, where the outbreak originated.

From MotherJones.com: Swine flu: Bringing home the bacon
=> https://www.motherjones.com/politics/2009/04/swine-flu-bringing-home-bacon/

As the world gears up once again for a flu pandemic that may or may not arrive (it actually seems possible this time), we might want to remember some of the lessons of the last flu scare. One of these is that there are winners as well as losers in every high-profile outbreak of infectious disease. First and foremost among them, of course, is Big Pharma, which can always be counted on to have its hand out wherever human misery presents an opportunity to rake in some cash.

From LayScientist.net:

This site wryly rounded up an array of blogs and tweets crying "Conspiracy!" A sample of the notes posted there:

ATTENTION AMERICA!!!! This is highly significant. The WHO 'Pandemic Control Room' is a creation of the Illuminati elite for the final 'end-game' killer virus mapping and tracking, and is thus equipped with super-computers tied to all U.N. member government's security forces.

Obama makes an official visit to Mexico, and a short week later, Mexico City schools, Universities and all PUBLIC BUILDINGS are shut down in pandemic fear -- (for the first time since the devastating 1985 earthquake!) Again, is this just a bizarre co-incidence?'

From Twitter:

How could we leave out the latest Internet phenomenon? Love it or hate it – Twitter is being talked about and used. Who knew that in 140 characters, hundreds of little tweet-ed paranoias could be passed and spread, much like a virus. From Twitter user @supergodiva:

- Is Swine Flu lethal Israeli scam to force Mexico=Gaza comparison via separation fence? =>
https://web.archive.org/web/20060601203928/http://www.haaretz.com/hasen/pages/rosnerBlog.jhtml?itemNo=719046&contrassID=25&subContrassID=0&sbSubContrassID=1&listSrc=Y&art=1

Ret. Army General Russell Honore asks @donlemoncnn 'Did this swine flu come out of a lab?' http://is.gd/uUaO'

Swine Flu reported as unusual as it affects the most healthy (20-45) vs weak kids/elderly. Perfect pathogen to quell dissent.

Finally, from NaturalNews.com:

The naturalists weigh in with "As Swine Flu Spreads, Conspiracy Theories of Laboratory Origins Abound." From the article:

It's not an unreasonable question to ask: Could world governments, spooked by the prospect of radical climate change caused by over-population of the planet, have assembled a super-secret task force to engineer and distribute a super virulent strain of influenza designed to 'correct' the human population (and institute global Martial Law)? => https://www.naturalnews.com/026141.html

So, what's the real truth here? One sick pig? Man-made lab experiment? Population control? Pharm companies cashing in? Rummy cashing in? Or a whole lot of floated hogwash?

What's your theory? Tell us in the comments below.

Dr. Leonard Horowitz

Mexican Flu Outbreak 2009 Special Report

YouTube, 28 April 2009
https://revolutiontelevision.net/video/mexican-swine-flu-outbreak-2009-special-report-by-dr-leonard-horowitz/

This unprecedented H1N1-H5N1 flu outbreak implicates the Ango-American Vaccine Pipeline, says world leading consumer health protector, Dr. Leonard Horowitz

Consider the skyrocketing stock values of Novavax, Inc., precipitated by dozens of alleged flu deaths in Mexico. Then investigate the leading Anglo-American network of genetic engineers manipulating, mutating, and distributing these viruses. The evidence compels you, for the benefit of public health and safety to seriously consider, even decree, a conspiracy to commit genocide, according to this Harvard trained expert in emerging diseases.

Here, Dr. Horowitz urges an investigation of Dr. James S. Robertson, Englands leading bioengineer of flu viruses for the vaccine industry, and avid promoter of U.S. Government funding for lucrative biodefense contracts, along with collaborators at the US Centers for Disease Control & Prevention (CDC). These suspects helped Novavax, Inc., in Bethesda, Maryland, produce genetically-modified recombinants of the avian, swine, and Spanish flu viruses, H5N1 and H1N1, nearly identical to the unprecedented Mexican virus that is allegedly spreading to the United States at the time of this posting. The outbreak was precisely timed to promote the companys new research and huge vaccine stockpiling contracts.

Scientists at the U.S. Centers for Disease Control (CDC) are implicated through collaborations and publications involving private contracts with Novavax, a company that obtains its biosimulars through CDC Influenza Branch director, Ruben O. Donis, and Dr. Rick Bright, previously working with Donis at the CDC, now Novavaxs Vice President of Global Influenza Programs.

Descriptions of this virus is pathognomonic, or diagnostic, of a virus that came from Robertsons circle of friends, Dr. Horowitz charges. No other group in the world takes H5N1 Asian flu infected chickens, brings them to Europe, extracts their DNA, combines their proteins with H1N1 viruses from the 1918 Spanish flu isolate, additionally mixes in swine flu genes from pigs, then reverse engineers them to infect humans. The end product could only have ended up in Mexico via the United States from Britain in care of the CDC. The CDC had to have sent them to Novavax, where Rick Brights team is now implicated in a conspiracy to commit genocide – the mass killing of people for profit.

Swine Flu Created in Lab as Bio-Weapon?

NWO Observer, 29 April 2009, 18:12
https://web.archive.org/web/20100624121808/http://nwoobserver.wordpress.com/2009/04/29/swine-flu-created-in-lab-as-bio-weapon/

According to a UN scientist, the swine flu virus, Ebola and HIV viruses were created artificially as military biological weapons…

According to the belief of two renowned reporters who spoke with top officials at the UN and WHO, the epidemic of the new strand of swine flu virus in Mexico is the result of an artificially created pathogen, the Online Journal reported.

Swine flu, Ebola and HIV were produced in laboratories

The reported from Mexico City claims that one of the leading UN scientists discovered certain joint transmission vectors, that is, the transmission of the swine flu virus is similar to the transmission of the Ebola virus and of the HIV/AIDS virus, which indicates that they were genetically modified with the aim of being military bio-weapons.

The UN scientist is convinced that the swine flu virus, A-H1N1, and Ebola and HIV viruses were in fact manufactured biological weapons.

As proof, they state that the usual process of transmission is that the virus is transmitted from a pig to a human, which is not the case in this outbreak because no case of a pig being infected with the A-H1N1 virus has been registered. Furthermore, the A-H1N1 virus partly contains American pig genes, partly human and bird flu strains and the virus of the Euro-Asian swine flu.

American military responsible

The other reporter, from Jakarta, claims that WHO leaders are worried that the current swine flu virus has been genetically modified to be transmitted from one species to another because of the fact that the A-H1N1 virus contains the genetic material of the H5N1 virus, that is, bird flu.

Allegedly, American scientists exhumed the body of a woman who died of the Spanish flu in 1918 and used the genetic material of the flu virus as the basis for the creation of the H5N1 virus through genetic manipulation. All this happened in laboratories at the Fort Detrick military base from which the new strain of anthrax called ames originated.

XstylëS

Свиной грипп из Мексики или заговор США?

XstyleS, 3 май 2009
https://xstyles.ru/razmyshlenie/111-svinojj-gripp-iz-meksiki-ili-zagovor-ssha.html

В начале марта публицист Сергей Дибров выступил с материалом «*Америка заметает следы*!»

Коротко: Компания Бакстер была замечена в подозрительных экспериментах по скрещиванию штаммов вируса гриппа человеческого и животного происхождения, что может быть особо опасно в общегуманитарных масштабах. Экспериментальные образцы были разосланы в партнёрские лаборатории восемнадцати стран, причём, без каких-либо необходимых в таких случаях примечаний. На момент выявления данного факта образцы были изъяты, а лабораторные сотрудники получили жёсткий карантин и были привиты противовирусными препаратами.

В европейской либеральной прессе шума не получилось – сообщения на эту тему стали попросту изымать.Теперь мы наблюдаем некий «свиной» грипп и компанию Бакстер, которая героически с ним борется на переднем крае вирусной войны – в Мексике. Не хочется фантазировать на тему разработки бактериологического оружия. Просто, всё это очень похоже на ещё один способ хорошо заработать на искусственно созданной болезни. Филиалы компании Бакстер представлены на территории России и Украины – вот, именно это и вызывает тревогу»

Поскольку появились сообщения о гибели людей в европейских странах, нам осталось ждать всего несколько дней, когда смерть примется косить и наши ряды. Об опытах коммерческих учёных, которые обслуживают не Науку и Человечество, а интересы конкретных корпораций, снято множество фильмов в тех же Штатах, и, можно сказать, население тщательно приготовили к раскрытию «страшной тайны», если секреты придадут огласке. Штамм вырвался из пробирки, и тайну пока что успешно заминают, но сценарий по её раскрытию уже, конечно, готов: придумают басню про зарвавшегося завлаба, который, подобно московскому майору, повздорил с женой и решил насолить всем людишкам, оставшимся равнодушными к его личной трагедии. Ну или типа того. Понятно, что завлаба найдут уже объеденным червями или язвами – в качестве справедливого возмездия.

А если серьёзно, то, например, версии о появлении того же ВИЧ аналогично восходят к американским медицинским опытам: тренировались на обезьянах – может, хотели сделать такую фигню, которая торкала бы исключительно любителей коммунизма (как версия), а фигня оказалась всеядной и быстренько побежала колошматить обычных граждан, начав, понятно дело, с «продвинутых» – с гомосексуалистов.

Вопрос стоит много шире, нежели просто очередной смертельный вирус – вопрос стоит о том, чтобы запретить коммерческим лабораториям заниматься исследованиями в тех областях, которые касаются искусственного создания болезней. Ведь что сделали в упомянутой конторе: там болезнь человека соединили с болезнью свиньи, и таким образом только свиные, грубо говоря, антибиотики на неё не действуют – равно как и только человеческие. Получился универсальный убийца, справятся с которым нескоро, потому что автор никогда открыто не скажет, что он и создал «свиной грипп».

Фактически речь идёт о том, что фармацевтические гиганты могут создавать новый виток глобальной «наркомании»: чтобы вы купили таблетки или ампулы с обычной наркотой, в вашем окружении должен нарисоваться дилер, а в вашей жизни – наступить «чёрная полоса». Обычный дилер может подождать такого стечения обстоятельств, а вот корпорации – нет: им нужен тот, кому жизненно необходимы «наркотики» прямо сейчас! Идеальный вариант – сделать человека зависимым при помощи вируса, болезни, которая уничтожается тем эксклюзивным, запатентованным средством, что есть только у этой корпорации. Конечно, для создания ажиотажа в аптеках нескольким тысячам придётся сдохнуть, но разве велика эта цена за миллионные партии лекарства от искусственной болезни?!

Удивляться такому цинизму уже не приходится – жизнь ничего не стоит, потому что у типового потребителя она и смысла особого не имеет. Если ты живёшь для того, чтобы работать, а работаешь, чтобы жить, то смешна цена такому прозябанию. Впрочем, и у таких животных есть право на жизнь: власти обязаны серьёзно разобраться с коммерческим научным миром и с коммерческими лабораториями, чтобы отобрать у них саму возможность креативить новую заразу.

Конечно, если только коммерческие лаборатории не являются просто неким «научным оффшором», местом, свободным для любых опытов, где спецслужбы занимаются антигуманными исследованиями, прикрываясь брендом. Этакие доктора Менгеле 21-го века. Думаю, как вариант – вполне жизнеспособная версия.

Richard Harris

New Strain May Edge Out Seasonal Flu Bugs

NPR, 4 May 2009, 12:03 PM ET
http://www.npr.org/templates/story/story.php?storyId=103711274&sc=emaf
https://web.archive.org/web/20090719002006/http://www.npr.org/templates/story/story.php?storyId=103711274&sc=emaf

Biologists say there's a good chance that the emerging flu strain could establish itself as the dominant strain of influenza in future flu seasons.

Three times in the last century, a substantially new flu virus has emerged and displaced the existing strains. That's quite different from the usual pattern, in which the circulating virus mutates just enough to keep vaccine makers tweaking their annual product.

"You can think of those strains, that vary from year to year, as though they were cousins in the same family. They are variations on a theme," says William Schaffner at Vanderbilt's medical school. But he says the emergence of this new virus is different. This virus, which originated partly in pigs, could be a game-changer.

"This one is completely new," Schaffner says. "This one is a stranger in town. We've never seen one like this before."

Pandemic Strains Become Dominant

The new swine flu virus has continued to spread, with more than 1,200 confirmed cases and 27 deaths worldwide. All but one of the fatalities occurred in Mexico, where officials decided Monday to allow most businesses to reopen Wednesday.

In the U.S., the number of confirmed cases stood at 310 in 37 states as of Monday evening.

The new swine flu virus is not merely a case of the usual gradual evolution. The big change scientists have seen with this strain is called a "shift."

The most infamous shift was the virus that appeared in 1917 and caused the deadly flu pandemic of 1918. That virus then became the dominant variety of flu for several decades. Then in 1957, it was displaced by another shift virus.

There was yet another shift in 1968, says Stephen Morse at Columbia University's Mailman School of Public Health.

"There does seem to be a rule of thumb about this, which is that every pandemic in the 20th century essentially established the variants that would become the circulating seasonal influenzas until the next pandemic came along to displace them," Morse says.

Each shift led to a stronger-than-usual flu season, but each one also calmed down after a year or two, once the population became exposed to the new viruses or were vaccinated. Morse says the question now is whether the new H1N1 swine virus will keep moving from person-to-person efficiently.

"If it continues like that, we'll expect to see this virus chugging along, and probably the next seasonal influenza will be a descendent of this one," Morse says.

Distant Cousins Provide Some Protection

The question, then, is how nasty the virus will end up being. Professor John Oxford at St. Bart's and the Royal London Hospital says there's some reason for cautious optimism.

"In one sense, it's one of the mildest shifts because most people on the planet have got some memory, have come across H1N1 viruses since 1978," Oxford says.

Even though health officials are calling this new virus H1N1, that's also the type of virus that's in wide circulation today. And it has an interesting history. It was the dominant flu virus through the 1920s, '30s and '40s. Oxford says it disappeared in 1957, when it was displaced by another flu virus. But then a strain of H1N1 suddenly reappeared in 1977.

"Now where could it have come from?" he asks. "We reckon now, in retrospect, it was probably released accidentally from a laboratory, probably in northern China or just across the border in Russia, because everyone was experimenting with those viruses at the time in the lab."

It was nothing malicious, Oxford believes, just some flu vaccine research that broke out of containment. The descendents of this virus are still circulating. He notes that most people who have encountered the newly emerged H1N1 virus seem to have developed only mild disease, and he speculates that's because we have all been exposed to a distant cousin, the H1N1 virus that emerged in the 1970s.

"That escaped virus perhaps will provide some benefit now in the face of this pig thing," Oxford says.

This is well-informed speculation, not iron-clad assurance. And there is another less reassuring lesson from the previous big shifts in flu viruses. They caused mild disease when they first appeared in the spring, but they all caused big flu seasons when they returned in the fall as the new dominant virus. That's one reason that health officials are taking the new virus very seriously.

Swine Flu may be Human Error, Scientist says; WHO Probes Claim

Bloomberg, 12 May 2009 // 13 May 2009
https://web.archive.org/web/20100526000030/http://www.bloomberg.com/apps/news?pid=20601087&sid=afrdATVXPEAk&refer=home

https://mapcruzin.com/news/swine-flu051309a.htm

May 13 (Bloomberg) – The World Health Organization is investigating a claim by an Australian researcher that the swine flu virus circling the globe may have been created as a result of human error.

Adrian Gibbs, 75, who collaborated on research that led to the development of Roche Holding AG's Tamiflu drug, said in an interview that he intends to publish a report suggesting the new strain may have accidentally evolved in eggs scientists use to grow viruses and drugmakers use to make vaccines. Gibbs said he came to his conclusion as part of an effort to trace the virus's origins by analyzing its genetic blueprint.

"One of the simplest explanations is that it's a laboratory escape," Gibbs said in an interview with Bloomberg Television today. "But there are lots of others."

The World Health Organization received the study last weekend and is reviewing it, Keiji Fukuda, the agency's assistant director-general of health security and environment, said in an interview May 11. Gibbs, who has studied germ evolution for four decades, is one of the first scientists to analyze the genetic makeup of the virus that was identified three weeks ago in Mexico and threatens to touch off the first flu pandemic since 1968.

A virus that resulted from lab experimentation or vaccine production may indicate a greater need for security, Fukuda said. By pinpointing the source of the virus, scientists also may better understand the microbe's potential for spreading and causing illness, Gibbs said.

Possible Mistake

"The sooner we get to grips with where it's come from, the safer things might become," Gibbs said by phone from Canberra yesterday. "It could be a mistake" that occurred at a vaccine production facility or the virus could have jumped from a pig to another mammal or a bird before reaching humans, he said.

Gibbs and two colleagues analyzed the publicly available sequences of hundreds of amino acids coded by each of the flu virus's eight genes. He said he aims to submit his three-page paper today for publication in a medical journal.

"You really want a very sober assessment" of the science behind the claim, Fukuda said May 11 at the WHO's Geneva headquarters.

The U.S. Centers for Disease Control and Prevention in Atlanta has received the report and has decided there is no evidence to support Gibbs's conclusion, said Nancy Cox, director of the agency's influenza division. She said since researchers don't have samples of swine flu viruses from South America and Africa, where the new strain may have evolved, those regions can't be ruled out as natural sources for the new flu.

No Evidence

"We are interested in the origins of this new influenza virus," Cox said. "But contrary to what the author has found, when we do the comparisons that are most relevant, there is no evidence that this virus was derived by passage in eggs."

The WHO's collaborative influenza research centers, which includes the CDC, and sites in Memphis, Melbourne, London and Tokyo, were asked by the international health agency to review the study over the weekend, Fukuda said. The request was extended to scientists at the Food and Agriculture Organization in Rome, the World Organization for Animal Health in Paris, as well as the WHO's influenza network, he said.

"My guess is that the picture should be a lot clearer over the next few days," Fukuda said. "We have asked a lot of people to look at this."

Virus Expert

Gibbs wrote or co-authored more than 250 scientific publications on viruses during his 39-year career at the Australian National University in Canberra, according to biographical information on the university's Web site.

Swine flu has infected 5,251 people in 30 countries so far, killing 61, according to WHO data. Scientists are trying to determine whether the virus will mutate and become more deadly if it spreads to the Southern Hemisphere and back. Flu pandemics occur when a strain of the disease to which few people have immunity evolves and spreads.

Gibbs said his analysis supports research by scientists including Richard Webby, a virologist at St. Jude Children's Research Hospital in Memphis, who found the new strain is the product of two distinct lineages of influenza that have circulated among swine in North America and Europe for more than a decade.

In addition, Gibbs said his research found the rate of genetic mutation in the new virus was about three times faster than that of the most closely related viruses found in pigs, suggesting it evolved outside of swine.

Gene Evolution

"Whatever speeded up the evolution of these genes happened at least seven or eight years ago, so one wonders, why hasn't it been found?" Gibbs said today.

Some scientists have speculated that the 1977 Russian flu, the most recent global outbreak, began when a virus escaped from a laboratory.

Identifying the source of new flu viruses is difficult without finding the exact strain in an animal or bird "reservoir," said Jennifer McKimm-Breschkin, a virologist at the Commonwealth Science and Industrial Research Organization in Melbourne.

"If you can't find an exact match, the best you can do is compare sequences," she said. "Similarities may give an indication of a possible source, but this remains theoretical."

The World Organization for Animal Health, which represents chief veterinary officers from 174 countries, received the Gibbs paper and is working with the WHO on an assessment, said Maria Zampaglione, a spokeswoman.

Genetic Patterns

The WHO wants to know whether any evidence that the virus may have been developed in a laboratory can be corroborated and whether there are other explanations for its particular genetic patterns, according to Fukuda. "These things have to be dealt with straight on," he said. "If someone makes a hypothesis, then you test it and you let scientific process take its course."

Gibbs said he has no evidence that the swine-derived virus was a deliberate, man-made product.

"I don't think it could be a malignant thing," he said. "It's much more likely that some random thing has put these two viruses together."

Gibbs, who spent most of his academic career studying plant viruses, said his major contribution to the study of influenza occurred in 1975, while collaborating with scientists Graeme Laver and Robert Webster in research that led to the development of the anti-flu medicines Tamiflu and Relenza, made by GlaxoSmithKline Plc.

Bird Poo

"We were out on one of the Barrier Reef islands, off Australia, catching birds for the flu in them, and I happened to be the guy who caught the best," Gibbs said. The bird he got "yielded the poo from which was isolated the influenza isolate strain from which all the work on Tamiflu and Relenza started."

Gibbs, who says he studies the evolution of flu viruses as a "retirement hobby," expects his research to be challenged by other scientists.

"This is how science progresses," he said. "Somebody comes up with a wild idea, and then they all pounce on it and kick you to death, and then you start off on another silly idea."

Adrian J Gibbs, John S Armstrong, Jean C Downie

From where did the 2009 'swine-origin' influenza A virus (H1N1) emerge?

Virol Journal, 24 November 2009, 6, 207.
https://doi.org/10.1186/1743-422X-6-207

Abstract

The swine-origin influenza A (H1N1) virus that appeared in 2009 and was first found in human beings in Mexico, is a reassortant with at least three parents.

Six of the genes are closest in sequence to those of H1N2 'triple-reassortant' influenza viruses isolated from pigs in North America around 1999-2000. Its other two genes are from different Eurasian 'avian-like' viruses of pigs; the NA gene is closest to H1N1 viruses isolated in Europe in 1991-1993, and the MP gene is closest to H3N2 viruses isolated in Asia in 1999-2000.

The sequences of these genes do not directly reveal the immediate source of the virus as the closest were from isolates collected more than a decade before the human pandemic started. The three parents of the virus may have been assembled in one place by natural means, such as by migrating birds, however the consistent link with pig viruses suggests that human activity was involved.

We discuss a published suggestion that unsampled pig herds, the intercontinental live pig trade, together with porous quarantine barriers, generated the reassortant. We contrast that suggestion with the possibility that laboratory errors involving the sharing of virus isolates and cultured cells, or perhaps vaccine production, may have been involved. Gene sequences from isolates that bridge the time and phylogenetic gap between the new virus and its parents will distinguish between these possibilities, and we suggest where they should be sought.

It is important that the source of the new virus be found if we wish to avoid future pandemics rather than just trying to minimize the consequences after they have emerged. Influenza virus is a very significant zoonotic pathogen. Public confidence in influenza research, and the agribusinesses that are based on influenza's many hosts, has been eroded by several recent events involving the virus.

Measures that might restore confidence include establishing a unified international administrative framework coordinating surveillance, research and commercial work with this virus, and maintaining a registry of all influenza isolates.

Washington's Blog

Health Organizations Checking Top Virus Scientist's Claim that Swine Flu May Have Escaped from Lab

Washington's Blog, 12 May 2009
https://web.archive.org/web/20090716201347/http://www.washingtonsblog.com/2009/05/health-organizations-checking-top-virus.html

Adrian Gibbs isn't a wild-eyed youth. He was one of the researchers whose worked was instrumental in the creation of the flu drugs Tamiflu and Relenza, and he has written or co-authored more than 250 scientific publications on viruses during his 39-year career at the Australian National University in Canberra.

The fact that Gibbs is saying that the swine flu may have escaped from a lab is causing the CDC and other health organizations to investigate his claim. They aren't buying it at this point, but they are looking into it.

Such speculation is not entirely new.

National Public Radio noted that Professor John Oxford at St. Bart's and the Royal London Hospital says that the 1957 H1N1 pandemic probably started when it escaped from a lab:

"We reckon now, in retrospect, it was probably released accidentally from a laboratory, probably in northern China or just across the border in Russia, because everyone was experimenting with those viruses at the time in the lab." It was nothing malicious, Oxford believes, just some flu vaccine research that broke out of containment.

Similarly, Bloomberg notes:

Some scientists have speculated that the 1977 Russian flu, the most recent global outbreak, began when a virus escaped from a laboratory.

It is also interesting that 2 of the 3 other flu pandemics of the last century - the 1918 Spanish Flu and the 1976 swine flu scare - both started at military bases. Specifically, the 1918 flu started at Fort Riley, Kansas. The 1976 swine flu started - and never spread beyond - Fort Dix, New Jersey. It is unclear whether or not those bases conducted defensive biowarfare research.

Swine Flu Came From Lab: Researcher
WHO investigates claim that H1N1 arose from human error

Newser, 13 May 2009, 4:22 AM CDT
https://www.newser.com/story/58841/swine-flu-came-from-lab-researcher.html

The World Health Organization is investigating a claim by an Australian researcher that the swine flu virus may have been created in a laboratory as a result of human error. Adrian Gibbs, who helped develop Tamiflu, said in an interview with Bloomberg that the new strain may have evolved in eggs that drug makers use to make vaccines. "One of the simplest explanations is that it's a laboratory escape," he said.

Gibbs came to suspect human error behind swine flu after analyzing the genetic blueprint of the H1N1 strain. The rate of genetic mutation in the new virus was about three times faster than similar viruses in pigs, which suggests it evolved outside of swine populations, he said. CDC officials in Atlanta said there was no evidence to support Gibbs' claim.

abcNEWS

Lee Ferran, Josh Gaynor

Tamiflu Developer: Swine Flu Could Have Come From Bio-Experiment Lab

ABC News, 14 May 2009
https://abcnews.go.com/GMA/SwineFlu/story?id=7584420&page=1
https://web.archive.org/web/20110629050551/http://abcnews.go.com/GMA/SwineFlu/story?id=7584420&page=1

An Australian researcher claims the swine flu, which has killed at least 64 people so far, might not be a mutation that occurred naturally but a man-made product of genetic experiments accidently leaked from a laboratory – a theory the World Health Organization is taking very seriously.

Adrian Gibbs, a scientist on the team that was behind the development of Tamiflu, says in a report he is submitting today that swine flu might have been created using eggs to grow viruses and make new vaccines, and could have been accidently leaked to the general public.

"It might be some sort of simple error that's not being recognized," Gibbs said on ABC's "Good Morning America."

In an interview with Bloomberg Television, Gibbs admitted there are other ways to explain swine flu's origin. "One of the simplest explanations if that it's a laboratory escape, but there are lots of others," he said.

In the United States, the Centers for Disease Control and Prevention says it has reviewed Gibb's report but says there is no evidence to support his claims, a conclusion many experts found comforting.

"Technically it's plausible but not likely," Christopher Ohl, an associate professor of medicine at Wake Forest University School of Medicine, and a specialist in infectious diseases.

"In this case I'm not concerned that this virus represents anything other than a naturally occurring mixture of viruses happening in nature," concluded Dr. Julie Gerberding, an infectious disease expert and the former director of the CDC.

Laboratory Safety

Regardless of the validity of Gibb's claims, he and several experts say that just bringing the idea of laboratory security to the public's attention is important. "There are lives at risk," Gibbs said. "The sooner this idea gets out, the better."

In 2001, foot-and-mouth disease led to the slaughter of more than 6 million animals, all after a vial went missing from a research laboratory in the United Kingdom. Since then, however, experts said lab security and regulations have been getting tighter and better. "Laboratories have a lot of security from having this happen, and it's very unlikely," Ohl said of the new theory about swine flu's origin.

Though Outbreak Seems to Slow, Experts Warn of Possible Surge

Even though the swine flu outbreak in Mexico is waning and the country reopened schools and businesses earlier this month, international health officials have still not ruled out the chance of a new surge in swine flu cases.

And infectious disease experts said that it is too early to say that we are out of the woods when it comes to the disease.

Dr. Gregory Poland, professor of medicine and infectious diseases at Mayo Clinic in Rochester, Minn., said that it is "way too early to 'pull back' yet in our level of concern.

"Always expect the unexpected from influenza," Poland said.

"While there are some signs that are reassuring, less severity, decrease cases in Mexico, et cetera, I believe we are not out of the woods yet," agreed Ohl. "I am concerned this virus is with us for a while. It could change, become more virulent, have an increased secondary transmission rate ... in the future."

The virus, according to the World Health Organization report today, has spread to 33 countries, 6,497 cases have been reported and more than 60 people have died after infected.

The WHO continues to urge individuals to "delay travel plans" in hopes of stemming the spread of the disease.

Tamiflu developer: Swine flu possibly man-made

eXaminer, 14 May 2009, 9:49 AM
https://web.archive.org/web/20090518024814/http://www.examiner.com/x-6495-National-Intelligence-Examiner~y2009m5d14-Tamiflu-developer-Swine-flu-possibly-manmade

Adrian Gibbs, a scientist on the team that developed Tamiflu, has submitted a report today stating that swine flu may have been man-made. The WHO is reviewing his claim.

An ABC News article published today on this revelation states: "Adrian Gibbs, a scientist on the team that was behind the development of Tamiflu, says in a report he is submitting today that swine flu might have been created using eggs to grow viruses and make new vaccines, and could have been accidently leaked to the general public."

What would cause one of the developers of the medication that is recommended as treatment for swine flu to come out with such a bold statement? Why would he risk his reputation in writing such a controversial report? Could Gibbs know something that is being hidden from the public? Could he possibly feel some remorse about the way his research and development with Tamiflu is being used?

The ABC article does not mention the prime suspect in this case, Fort Detrick, Maryland. For decades, Fort Detrick has been a center of research into biological defense and warfare. On the official website, Fort Detrick is described as "home to the United States Army Medical Research and Materiel Command, the National Cancer Institute and 37 mission partners. The primary missions include biomedical research and development, medical materiel management and global telecommunications. We are also home to a National Interagency Confederation for Biological Research and National Interagency Biodefense Campus."

Numerous researchers of these matters have long claimed that biodefense research centered at Fort Detrick has been actively developing and testing highly dangerous viruses which, if released, could spread deadly pandemics around the globe. A few researchers, such as Dr. Leonard Horowitz, even believe that rogue elements of government may have already released some of these dangerous viruses into the public to forward their own hidden agendas. Could this be what Tamiflu developer Adrian Gibbs is referring to?

A webpage posted by the highly respected Dr. Mercola on his popular health website mercola.com is titled "Critical Alert: The Swine Flu Pandemic – Fact or Fiction?" This excellent webpage has received over one million visits since being posted on April 29th. In this informative essay, Dr. Mercola states, "[The swine flu] has a noticeable subplot - preparing you for draconian measures to combat a future pandemic as well as forcing you to accept the idea of mandatory vaccinations." He mentions the previous swine flu in 1976 when only one person actually died, yet fear-mongering by the government led to massive vaccinations, which in turn caused at least 30 deaths as a direct result of contaminated vaccines.

Dr. Mercola, Dr. Horowitz, and many others have pointed out how the fear generated by the media and government with the avian and swine flu has made some individuals very wealthy. Former Secretary of Defense Donald Rumsfeld alone added $5 million to his investment portfolio thanks to massive sales of Tamiflu during the avian flu scare, which never materialized. Note that Tamiflu is also being recommended for the current swine flu scare.

How much of the swine flu scare is real and how much is fear mongering? Could it be that certain members of the power elite profit handsomely when fear is spread around the globe through exaggerated alerts such as the avian flu and swine flu scares? Could there actually be deadly man-made viruses created at Fort Detrick and elsewhere, which if released could cause a true pandemic killing millions around the globe? These are important questions worth exploring.

If you are interested in learning more from reliable sources and working to make a difference on this vital topic, the box immediately below provides several excellent ideas on what you can do. We also invite you to comment below and let us know your thoughts. Do you think rogue elements of government might have had something to do with the swine flu scare?

CIDRAP

WHO rejects idea that novel H1N1 virus is lab-derived

CIDRAP, 14 May 2009
https://www.cidrap.umn.edu/avian-influenza-bird-flu/who-rejects-idea-novel-h1n1-virus-lab-derived

May 14, 2009 (CIDRAP News) – An international group of experts has examined and rejected the idea proposed recently by an Australian scientist that the novel H1N1 influenza (swine flu) virus is the product of a laboratory accident, the World Health Organization (WHO) reported today.

"The group of scientists feels that this hypothesis does not really stand up to scrutiny, that the evidence suggests that this is a naturally derived virus, and not a laboratory-derived virus," said Dr. Keiji Fukuda, WHO assistant director-general for health security and environment, at a press briefing today.

Adrian Gibbs, 75, a veteran flu researcher, said recently that he had concluded from his analysis of the virus's genetic sequence that it might have evolved in eggs used by scientists to grow viruses and by drug companies to make flu vaccines. Gibbs said he intended to publish a scientific paper describing his hypothesis, according to a May 13 Bloomberg News report.

Fukuda said Gibbs contacted the WHO May 9 to communicate his idea, which he had arrived at by studying genetic data deposited in public databases, not from studying the virus directly.

"Because of the nature of the hypothesis and the credible nature of the scientist, we took this seriously," Fukuda said. The Bloomberg story said Gibbs was involved in research that led to the development of oseltamivir (Tamiflu).

After hearing Gibbs' idea, the WHO asked five of its collaborating centers to evaluate it, Fukuda said. A day later the agency asked the United Nations Food and Agriculture Organization (FAO) and the World Organization for Animal Health (OIE) to do the same. WHO officials discussed the hypothesis with a large group of experts in both human and animal influenza 2 days ago, he said. They concluded that Gibb's proposition didn't fit the evidence.

Fukuda added that the WHO will need to review Gibbs's research article when it is published, but he indicated that it is unlikely to change the experts' conclusions.

He cited the episode as a positive example of rapid, open scientific communication and debate on medical issues, facilitated by putting genetic data in public repositories.

"We live in an age when it's really not possible to hide things," he said. "It's all for the better as far as I'm concerned. Maybe it means a little more work, but you can also address it in a way which is convincing to people."

"This is much better than dealing with rumors in which the basis for the rumor is not clear and then dealing with answers in which the basis of the answer is not clear," he added.

In response to a question, Fukuda said Gibbs suggested that the novel virus seems to have an increase in lysine (an amino acid) residues and that it sits out on a "long branch" of the influenza phylogenetic tree in comparison with other swine flu viruses. He said it is known that growing flu viruses in eggs can lead to an increase in lysine residues.

However, human, avian, and swine flu viruses differ somewhat in this respect, Fukuda said, adding, "After discussion and looking at older swine influenza viruses, it was concluded that the amount of lysine being seen was in fact very consistent with the natural increase in lysine being seen in swine flu viruses."

Also, the experts who evaluated the hypothesis said that because of historical gaps in swine flu genetic data, many swine flu viruses are somewhat isolated on the phylogenetic tree, so Gibbs' observation on this point was nothing unusual, according to Fukuda.

In other comments at today's briefing, WHO spokesman Gregory Hartl announced that the agency's daily briefings would be suspended for about a week because of upcoming WHO meetings.

A WHO-hosted intergovernmental meeting on virus sharing will begin tomorrow, Hartl said. That will be followed by the World Health Assembly, the annual meeting of WHO member countries, which runs all of next week.

The intergovernmental meeting will deal with the sharing of viral isolates and access to vaccines and other products derived from them, an issue pursued by Indonesia in relation to H5N1 avian flu in recent years.

In other comments at today's briefing:

- Fukuda said experts who met today to discuss whether to recommend mass production of a vaccine for the novel H1N1 virus will probably need to meet several more times before they can come to a conclusion.

- He said the WHO has not seen any evidence that the novel virus is resistant to the antiviral drugs in use (oseltamivir and zanamivir), and the agency is not making any changes in its recommendations on antiviral use.

- The WHO continues to be concerned about the fact that most of the people infected with the H1N1 virus have been young, he said. About half of those who died were healthy and had no predisposing conditions. "It's highly unusual for young, healthy people to die from influenza," he said. "So this is a pattern which is different than what we see with normal influenza," though it has been seen in previous pandemics.

The New York Times

Donald G. McNeil Jr.

Swine Flu Not an Accident From a Lab, W.H.O. Says

The New York Times, 14 May 2009, p. A12
https://www.nytimes.com/2009/05/15/health/policy/15flu.html
https://web.archive.org/web/20110403002252/https://www.nytimes.com/2009/05/15/health/policy/15flu.html

The swine flu virus did not result from a laboratory accident, the World Health Organization said Thursday, working to debunk rumors started by an Australian virologist and circulated by news outlets all over the world.

"We took this very seriously," Dr. Keiji Fukuda, the agency's deputy director general, said of the virologist's assertion. "But the evidence suggests that this is a naturally occurring virus, not a laboratory-derived virus."

In a telephone news conference, Dr. Fukuda also expressed support for drug companies' making a generic version of the antiviral drug Tamiflu. Many poor countries have no stockpiles of the drug.

Almost 6,500 confirmed cases of the new H1N1 flu have been reported from 33 countries, and 65 people have died, the W.H.O. said. About 4,300 confirmed and probable cases, with 3 deaths, were reported in the United States.

A woman in Arizona who was suffering from lung disease died last week from complications of swine flu, the Maricopa County Department of Public Health said late Thursday, Reuters reported.

The virus rumor was started by Adrian J. Gibbs, a retired plant virologist from the Australian National University, who previously published work in the journal Science questioning the idea, now accepted, that the 1918 pandemic started as a bird flu.

Dr. Gibbs, who had studied the gene sequences of the swine flu virus posted on public data banks, argued that it must have been grown in eggs, the medium used in vaccine laboratories. He reached that conclusion, he said, because the new virus was not closely related to known ones and because it had more of the amino acid lysine and more mutations than typical strains of swine flu.

His theory was reported by Bloomberg News on Tuesday. Even though scientists at the Centers for Disease Control and Prevention were skeptical and some prominent virologists openly derisive, news outlets have repeated and magnified the theory, adding speculation about bioterrorism that even Dr. Gibbs repudiated. He was also interviewed Thursday on the ABC News program "Good Morning America."

Dr. Fukuda said a W.H.O. panel of experts had concluded that "the hypothesis does not really stand up to scrutiny." The lysine residues and mutation rates were typical, he said, and many swine flus seem unrelated because not enough pigs are tested each year.

But he added that he doubted that the rumor would prove damaging, and he said he would not want genetic sequences kept off public databases.

“This is healthy,” he said. “This is much better than dealing with rumors where you don’t know where the mistake comes from and can’t correct it.”

Persistent false rumors, like those that AIDS is not caused by a virus or that polio vaccine sterilizes Muslim girls, have devastated efforts to control other diseases.

Scientists have yet to pinpoint the origin of the swine flu virus, the earliest cases of which were found in Veracruz, Mexico. It contains genes from flu viruses that normally circulate in pigs in Europe and Asia, as well as avian and human genes.

Late Thursday, Smithfield Foods reported that the Mexican health authorities had not found the new virus in herds at its huge hog-fattening operations in Veracruz, which some have blamed for the outbreak. But it was not clear what test was used; only blood tests for antibodies would show whether pigs had the virus in February, when the human outbreak is thought to have begun.

As for the use of oseltamivir, the generic form of Tamiflu, the W.H.O. has certified only one drug – Antiflu, made by the Indian company Cipla in both pill and liquid forms – as equivalent to brand-name Tamiflu.

Dr. Yusuf K. Hamied, Cipla’s chairman, said he would sell large amounts to Mexico and was in discussion with countries in Africa, Latin America and the Middle East.

The move could prompt patent lawsuits by Gilead Sciences and Roche, which developed and sell Tamiflu, so Cipla will sell only to countries indemnifying them against such suits, the company said.

Roche has offered 6.5 million doses of Tamiflu to the World Health Organization and 1 million doses to Mexico.

Dr. Hamied, reluctant to buy supplies for orders that might not materialize, said that poor countries should stockpile shikimic acid, the oseltamivir precursor, then pay Cipla or other generic companies to make the drug as needed.

The swine flu may cause the W.H.O. to cut short its nine-day annual conference of world health ministers so they can get home to fight the disease, Reuters reported.

Michel Chossudovsky, Prof.

The A H1N1 Pandemic: Pig to Human Transmission of the Swine Flu?

Global Research, 15 May 2009.
http://www.globalresearch.ca/index.php?context=va&aid=13622

The initial outbreak of the H1N1 swine virus is said to have occurred in Mexico. The emphasis, at the political level, has been on tracking the spread of the Mexican swine flu virus as well controlling and monitoring the movement of people in and out of Mexico. A global campaign of fear and insecurity was unleashed following the WHO April 28 announcement of a phase 5 pandemic. The decision of the WHO, which was taken after consultations with Washington and Brussels, was based on unconfirmed and incomplete data regarding the spread of the swine flu and the numbers of cases.

What proves that Mexico was the epicentre of the WHO's global swine flu pandemic?

There are several important issues underlying this question:

1. The official data pertaining to morbidity and mortality were, in numerous cases, both in Mexico, the US and around the World, **not firmly corroborated by laboratory testing of the H1N1 virus.**

A large number of so-called recorded cases were the result of data manipulation. The Mexican data used by the WHO to justify the phase 5 pandemic, largely pertained to cases of non-specific rather than laboratory confirmed H1N1 influenza. Out of the 159 deaths reported prior to the WHO's decision on April 28th, only 7, according to official sources, had been corroborated by laboratory tests of H1N1 infection.

Another case in point, which directly implicates the Atlanta based Centers for Disease Control and Prevention (CDCP), was an April 30 report by the CDCP entitled *Swine-Origin Influenza A (H1N1) Virus Infections in a School — New York City.* The report outlines swine flu infection among New York school children, when in fact the children had been infected with a non-specific influenza. None of these cases were corroborated by laboratory testing:

In the first week in May, "the CDC claimed 109 victims of confirmed swine flu in the United States. Forty five of the 109 came from this New York School. The TV news channels were flooded with panic messages of the uncontrolled spread of Swine Flu." (see William Engdahl, Flying Pigs and the WHO, Global Research, May 2009)

The question is: can we trust the official figures and statements.

2. Numerous cases of alleged H1N1 infection in North America, the Europe Union and other countries have been reported, which bear no causal relationship to the Mexican outbreak, namely they *cannot be traced back to Mexico.*

Are the cases of H1N1, reported in different countries, the consequence of a process of international transmission of the swine flu virus, or are they the result of a pre-existing situation? Or are they the consequence of a process of incorrect and misleading recording of the data. In other words, were these various "recorded cases" corroborated by lab testing of the H1N1 virus?

3. According to a recent report (Bloomberg, May 12, 2009) which was barely publicised, a prominent scientist directly involved in the development of Tamiflu points to the possibility that **the H1N1 strain "resulted from lab experimentation or vaccine production".** According to professor Adrian Gibbs of the Australian National University (ANU), the virus which "escaped from a lab", was the direct product of a laboratory experiment by the company which produces Tamiflu.

" "It could be a mistake" that occurred at a vaccine production facility or the virus could have jumped from a pig to another mammal or a bird before reaching humans, he said." (Ibid)

There have been several previous unconfirmed reports on the issue. Professor John Oxford of St. Bart's and the Royal London Hospital contends that "the 1957 H1N1 pandemic probably started when it escaped from a lab" (National Public Radio, May 4, 2009).

While the findings of Professor Gibbs require further investigation, they, nonetheless, raise the broader issue of transmission out of a laboratory, not to mention the underlying geographic location of a laboratory. The WHO is investigating the findings of Professor Gibbs.

4. The issue of pig to human transmission of the virus has been carefully overlooked. Can pigs infect humans with swine flu? This question is fundamental in assessing the origins as well as the causes of the pandemic.

Are industrial hog farms a source of infection? *A priori,* industrial hog farms are ruled out as a possible source of viral infection both by the WHO and the Atlanta based CDCP: "The World Health Organization has insisted there is no evidence that pigs are passing the virus to humans, or that eating pork products poses an infection risk." (Canadian Press, May 2, 2009)

Ironically, while denying pig to human transmission of the swine flu, health authorities do not deny the transmission of the H1N1 from humans to pigs.

Pig to Human Transmission of Swine Flu

The focus of the WHO and the Atlanta based CDCP has been on human to human transmission of the swine flu virus, from one country to another, while carefully avoiding the broader issue of pig to human transmission.

The WHO has argued that in the case of the H1N1 swine flu strain (a hybrid combination of human, pig and avian flu), there is no possible transmission from pigs to humans. This assessment implies that the health and environmental conditions on the hog farms have nothing to do with the spread of the virus.

While one of the first cases of the H1N1 influenza was recorded in the municipality of Perote, State of Veracruz, which houses an extensive hog farm industry, Mexican public health officials are categorical: the environmental and health conditions in the hog farms are not the cause of the transmission.

The City of La Gloria, Perote, is a company town, which is described in some Mexican reports as the pandemic's "ground zero". The employer is Granjas Carroll, a joint venture between the World's largest hog producing company Smithfield and its Mexican partner Agroindustrias Unidas de Mexico (AUM). The Smithfield project in Perote Municipality includes 16 farms and an annual output of more than one million pigs.

According to official Mexican data, there is no tangible evidence of swine flu within the Perote hog farms, namely the pigs were not infected. A number of other ailments could, however, have been triggered among the population as a result of the health and environmental conditions in the factory farms.

The broader question is whether we can actually trust the data.

Scientific Evidence of Pig to Human Transmission

A recent authoritative study by the John Hopkins School of Public Health on Industrial Farm Animal Production (IFAP) refutes the statements of the WHO. It confirms that IFAP hog farms are not only the source of contamination of surrounding groundwater but also of the spread of novel viruses including swine flu (See Pew Commission on Industrial Farm Animal Production, Pew Foundation and Bloomberg and John Hopkins School of Public Health, Putting Meat on the Table Industrial Farm Animal Production in Americas, see also Washington Post, May 9 2009).

These viruses can be transmitted from pigs to humans and then "from person to person in a community setting and well beyond." (Ibid) The transmission can also occur in the food chain. The virus contaminates the meat which is then consumed:

"An infectious agent that originates at an IFAP facility may persist through meat processing and contaminate consumer food animal products, resulting in a serious disease outbreak far from the ifap facility" (See Putting Meat on the Table Industrial Farm Animal Production in Americas, p. 11.)

Canadian Pigs Infected by the "Mexican Flu"

While the data regarding Granjas Carroll in Perote Municipality, remains inconclusive, there is evidence, confirmed by official reports, that at least one hog farm outside Mexico was infected by the H1N1 virus.

In early May, health authorities in Canada reported on a rather unusual case whereby an entire hog farm in the province of Alberta became infected with the H1N1 swine flu. A Mexican carpenter, returning from Mexico to a hog farm in central Alberta where he was employed, allegedly infected 220 hogs out of a total of 2200.

While denying the possibility that pigs could infect humans, Canadian officials contend that the pigs were infected by the Mexican carpenter, who had returned from Mexico:

"The farm worker returned to Canada from Mexico on April 12 and had contact with the pigs two days later. About 220 pigs in the herd of 2,200 began showing signs of the flu on April 24, said the country's top veterinary officer, Dr. Brian Evans of the Canadian Food Inspection Agency.

All of the pigs are recovering or have recovered and the farm worker has also recovered.

One other farm worker subsequently fell ill. It's not yet known if that person caught the swine flu.

Bulletins were sent to Alberta pork producers warning them of the possible danger that swine flu could present to their herds on April 24, said Gerald Hauer, the province's chief provincial veterinarian. But by that time, the farm worker was already back from Mexico and on the job at the 2,200-hog operation. "He was in the barn, doing his work on April 14," Hauer said.

The farmer notified provincial officials that an unspecified number of his animals were showing flu symptoms on April 28. The barn was quarantined later that day and remains under quarantine." (Canadian Press, May 3, 2009)

The Alberta hog farm, which is part of an evolving saga, is central to an understanding of the origins of the pandemic, namely that pigs on IAFP farms in North America could potentially be the source of pig to human infection.

Stage One. Mexican Carpenter infects the Pigs, Owner of the Farm and Family

The official version is that *the hogs were infected by a Mexican worker.*

According to the first press reports, the owner of the hog farm and his family as well as the pigs were infected by the Mexican worker. These official reports pointed unequivocally to Mexico as the source of the infection on the alberta hog farm.

Stage Two: Owner and Family of Hog Farm Test Negative

It was subsequently confirmed after laboratory confirmation that the owner and family members tested negative to the H1N1 virus.

"Canada's chief public health officer says *the people who live on an Alberta pig farm where pigs were found to be infected with swine flu have tested negative for the virus.*

A number of people living on the unidentified pig farm experienced flu-like symptoms after the pigs fell ill and *were tested to see if they too were infected.*

But Dr. David Butler-Jones says tests suggest *the people were not infected with the H1N1 swine virus.* (Edmonton Sun, May 5, 2009)

The official version is that the Mexican worker infected the pigs but not the people on the farm.

Stage Three: Mexican Carpenter Tests Negative

The Mexican carpenter also tested negative to the virus, which suggests that he could not be the source of a human to pig transmission:

The pigs are thought to have been infected by a worker who had been in Mexico and was ill on his return to work in mid-April. *The unidentified carpenter also tested negative for the virus*, … (Edmonton Sun, May 5, 2009)

Stage Five: The Official Story Sticks. The Mexican carpenter infected the Pigs

Following the release of the lab reports confirming that the Mexican carpenter tested negative to the H1N1 virus, one might have expected that the Canadian authorities would have broadened their assumptions. If the Mexican worker tests negative, what are the likely causes of the H1N1 infection on the Alberta hog farm?

Despite the visible lack of reliable evidence, the Mexican farm worker is still considered to be the source of the infection.

The official story sticks.

"Butler-Jones says, though, that there may have been "sampling issues" and blood samples from the people will be tested for antibodies to look for a definitive answer on whether they were infected. He won't say how many people were tested or what he means by sampling issues." (ibid) One might reasonably ask: was the culling intended to get rid of the evidence of infection on the hog farm?

A few days, following the report, Canadian officials announced that one quarter of the herd including the infected pigs had been culled. The pigs were infected by a Mexican. Canadian health officials believe that he tested negative to the H1N1 "because he was too far along in his recovery"**.** They have ordered new blood tests, "looking for antibodies to the new H1N1 swine flu virus". (Canadian Press, May 6, 2009)

Stage Six: Culling the Infected Pigs. Covering Up the Evidence?

The pigs are infected. But all the humans on the hog farm, including the Mexican carpenter, test negative. No report has been released regarding the results of the antibody test.Culling is defined as killing animals "with undesirable characteristics", namely getting rid of the infected hogs.

Canadian animal health officials are categorical the culling is not related to the fact that the animals are infected with the H1N1 virus:

"*This doesn't have anything to do with the flu*," Hauer told a news conference. "It has to do … with animal welfare." The decision to cull the herd [500 heads] was to ease overcrowding, Dr. Gerald Hauer said Saturday.

"Due to the quarantine, these animals cannot be moved off the farm as they normally would. The living conditions would soon become unacceptable due to overcrowding and they (the pigs) would have been in distress," Hauer said. (CBC, May 10,2009)

Concluding Remarks

The evidence of person to person transmission across international borders remains to be firmly established. The US authorites have used the Mexican flu outbreak as a pretext to tighten up security on the US-Mexican border,

Did the pandemic originate in Mexico. The evidence is contradictory.

Many of the reported cases in Canada, the US, and around the World, cannot be traced back to the epicenter of the virus in Mexico.

These cases were discovered and reported following the Mexican outbreak. The question is whether they were "discovered" as a result of a process of laboratory examination or were recorded without adequate testing. Are these figures reliable. Are they the product of data manipulation with a view to creating an atmosphere of fear and panic.

Is the H1N1 swine virus prevalent in industrial hog farms?

Visibly there was an outbreak of swine influenza in a central Alberta hog farm, confirmed by the Canadian health authorities. The pigs tested positive to the H1N1 virus, according to the official report. People on the farm tested negative. Canadian officials have failed to address the exact causes of the swine flu on the Albertan hog farm. It is worth noting that there was intense lobbying by the pork industry to change the name of the virus, from swine flu to A H1N1 influenza.

If the Mexican carpenter is not the source of the infection, this suggests that the H1N1 swine flu was already prevalent in the Alberta hog farm and had noting to do with the outbreak in Mexico. This in turn raises the broader issue of H1N1 swine flu infection in similar Canadian and US hog farms as well as the issue of pig-human transmission of the virus.

What happened on the Alberta hog farm, therefore, could potentially upset North America's industrial hog production.

Reassortment between avian H5N1 and human H3N2 influenza viruses in ferrets a public health risk assessment

J Virol. 3 June 2009 // 2009 Aug; 83(16):8131-40.
doi: 10.1128/JVI.00534-09. Epub. PMID: 19493997; PMCID: PMC2715755.

Abstract

This study investigated whether transmissible H5 subtype human-avian reassortant viruses could be generated in vivo. To this end, ferrets were coinfected with recent avian H5N1 (A/Thailand/16/04) and human H3N2 (A/Wyoming/3/03) viruses.

Genotype analyses of plaque-purified viruses from nasal secretions of coinfected ferrets revealed that approximately 9% of recovered viruses contained genes from both progenitor viruses.

H5 and H3 subtype viruses, including reassortants, were found in airways extending toward and in the upper respiratory tract of ferrets. However, only parental H5N1 genotype viruses were found in lung tissue.

Approximately 34% of the recovered reassortant viruses possessed the H5 hemagglutinin (HA) gene, with five unique H5 subtypes recovered. These H5 reassortants were selected for further studies to examine their growth and transmissibility characteristics. Five H5 viruses with representative reassortant genotypes showed reduced titers in nasal secretions of infected ferrets compared to the parental H5N1 virus.

No transmission by direct contact between infected and naïve ferrets was observed.

These studies indicate that reassortment between H5N1 avian influenza and H3N2 human viruses occurred readily in vivo and furthermore that reassortment between these two viral subtypes is likely to occur in ferret upper airways.

Given the relatively high incidence of reassortant viruses from tissues of the ferret upper airway, it is reasonable to conclude that continued exposure of humans and animals to H5N1 alongside seasonal influenza viruses increases the risk of generating H5 subtype reassortant viruses that may be shed from upper airway secretions.

Unlogged Pathogen Samples Found at Fort Detrick

Science, 17 June 2009.
https://www.science.org/content/article/unlogged-pathogen-samples-found-fort-detrick

A 4-month effort to inventory the contents of freezers and refrigerators at the United States Army Medical Research Institute of Infectious Diseases (USAMRIID) in Fort Detrick, Maryland, has turned up 9,220 vials of dangerous pathogens and toxins that were not listed in USAMRIID's database.

USAMRIID officials announced at a press conference today that the institute has resumed all of its research activities, which were suspended in early February to enable a complete accounting of select agents at the premier biodefense lab. The institute has been under intense public scrutiny since last summer when the Federal Bureau of Investigation's implicated former USAMRIID researcher Bruce Ivins in the 2001 anthrax letter attacks.

The labs at USAMRIID house more than 70,000 vials of select agents and toxins, including samples of Ebola, anthrax, and other deadly germs. Officials decided to conduct a full inventory of the materials after researchers found four vials of Venezuelan Equine Encephalitis in a freezer that had never been entered into the institute's electronic database, created in 2005. They turned out to be just the tip of the iceberg. The inventory showed that 13% of the vials at the institute were not in the database, which officials had been using to keep track of materials.

Most of the unlisted vials were materials left behind by researchers who had left the institute before 2005, Col. Mark Kortepeter, USAMRIID's deputy commander, told reporters at today's press conference. "The vast majority of these were working stocks that had accumulated over several decades," he said, explaining that the initial inventory for the electronic database 4 years ago had focused on vials that were in active use. Kortepeter said it was very "unlikely" that any unlisted vials had been lost or stolen.

About half of the 9220 vials were destroyed after scientists determined that the materials in them were of limited scientific value, Kortepeter said. The rest were added to the database. The institute plans to conduct a 100% inventory every year from now on, he said.

Fort Detrick Inventory Turns up 9,220 More Vials of Pathogens

The Washinogton Post, 18 June 2009
https://www.washingtonpost.com/wp-dyn/content/article/2009/06/17/AR2 009061703271.html
https://web.archive.org/web/20121112050843/http://www.washingtonpost.com/wp-dyn/content/story/2009/06/17/ST2009061703604.html

An inventory of potentially deadly pathogens at Fort Detrick's infectious disease laboratory found more than 9,000 vials that had not been accounted for, Army officials said yesterday, raising concerns that officials wouldn't know whether dangerous toxins were missing.

After four months of searching about 335 freezers and refrigerators at the U.S. Army Medical Research Institute of Infectious Diseases in Frederick, investigators found 9,220 samples that hadn't been included in a database of about 66,000 items listed as of February, said Col. Mark Kortepeter, the institute's deputy commander.

FBI investigators concluded that Fort Detrick probably was the source of the anthrax spores used in the deadly mailings of 2001 (2008 Photo By Susan Biddle - The Washington Post).

The vials contained some dangerous pathogens, among them the Ebola virus, anthrax bacteria and botulinum toxin, and less lethal agents such as Venezuelan equine encephalitis virus and the bacterium that causes tularemia. Most of them, forgotten inside freezer drawers, hadn't been used in years or even decades. Officials said some serum samples from hemorrhagic fever patients dated to the Korean War.

Kortepeter likened the inventory to cleaning out the attic and said he knew of no plans for an investigation into how the vials had been left out of the database. "The vast majority of these samples were working stock that were accumulated over decades," he said, left there by scientists who had retired or left the institute.

"I can't say that nothing did [leave the lab], but I can say that we think it's extremely unlikely," Kortepeter said.

Still, the overstock and the previous inaccuracy of the database raised the possibility that someone could have taken a sample outside the lab with no way for officials to know something was missing.

"Nine thousand, two hundred undocumented samples is an extraordinarily serious breach," said Richard H. Ebright, a professor at Rutgers University who follows biosecurity. "A small number would be a concern; 9,200 . . . at an institution that has been the focus of intense scrutiny on this issue, that's deeply worrisome. Unacceptable."

The institute has been under pressure to tighten security in the wake of the 2001 anthrax attacks, which killed five people and sickened 17. FBI investigators say they think the anthrax strain used in the attacks originated at the Army lab, and its prime suspect, Bruce E. Ivins, researched anthrax there. Ivins committed suicide last year during an investigation into his activities.

Kortepeter noted that since 2001 the lab has imposed multiple layers of security to check people entering and leaving, that there are now cameras in the labs, and that employees are subjected to a reliability program and random inspections.

"The bottom line is, we have a lot of buffers to prevent anybody who shouldn't be getting into the laboratory," Kortepeter said.

Sam Edwin, the institute's inventory control officer, said most of the samples found were vials with tiny amounts of pathogens that would thaw quickly and die once they were taken out of a freezer, making smuggling something off the base difficult.

The probe began in February, when a problem accounting for Venezuelan equine encephalitis virus triggered the suspension of most research at the lab. A spot check in January found 20 samples of the virus in a box of vials instead of the 16 listed in the institute's database. Most work was stopped until the institute could take a thorough inventory of its stock of viruses and bacteria.

Edwin said about 50 percent of the samples that had been found were destroyed. The rest were added to the catalog. Because the lab will now conduct an inventory every year, "it's really less likely that we will be in a situation like this again," he said.

Procedures have changed, too. Scientists who have worked at the lab said that in the past, departing scientists turned over their logbooks to their successors, but records were sometimes incomplete or complex. As generations of scientists passed through, the knowledge of what was in the freezers was lost. With a comprehensive database, every sample is now tracked until it is destroyed or transferred.

But some scientists are skeptical. Unlike uranium or chemical weapons, pathogens are living materials that can replicate and die. A small amount can easily be turned into a large amount. They said the strict inventories slow their work without guaranteeing security.

Swine flu made in USA

Russia Today, 25 June 2009
https://web.archive.org/web/20100725152156/http://www.youtube.com/watch?v=eNS0Q-uxycA

An American investigative journalist, who claims that swine flu strains *have been engineered in two universities in the US and Canada*, says they've been deliberately designed to resist vaccines.

INDEPENDENT

Did leak from a laboratory cause swine flu pandemic?

Independent, 30 June 2009 00:00 BST
https://www.independent.co.uk/news/science/did-leak-from-a-laboratory-cause-swine-flu-pandemic-1724448.html

Same strain of influenza was released by accident three decades ago.

It has swept across the world killing at least 300 people and infecting thousands more. Yet the swine flu pandemic might not have happened had it not been for the accidental release of the same strain of influenza virus from a research laboratory in the late 1970s, according to a new study.

Scientists investigating the genetic make-up of flu viruses have concluded there is a high probability that the H1N1 strain of influenza "A" behind the current pandemic might never have been re-introduced into the human population were it not for an accidental leak from a laboratory working on the same strain in 1977.

Yesterday, the Department of Health announced a further surge in the number of cases in Britain with another 1,604 confirmed over the weekend, and the death of a girl in Birmingham with underlying medical complications; the third death in Britain from swine flu-related problems.

Almost 6,000 Britons have now been infected with the influenza "A" (H1N1) strain of swine flu. But two medical researchers believe that this strain of the virus had been extinct in the human population for more than 20 years until it was unwittingly reintroduced by scientists working in a research lab somewhere in the world, leading to a pandemic in 1977 that began in Russia and China.

"Careful study of the genetic origin of the [1977] virus showed that it was closely related to a 1950 strain, but dissimilar to influenza 'A' (H1N1) strains from both 1947 and 1957. This finding suggested that the 1977 outbreak strain had been preserved since 1950. The re-emergence was probably an accidental release from a laboratory source," according to the study published in The New England Journal of Medicine.

Shanta Zimmer and Donald Burke from the University of Pittsburgh in Pennsylvania said that influenza "A" (H1N1) disappeared completely from humans after a pandemic of another strain of flu in 1957. H1N1 was not detected in annual surveillance until an outbreak of H1N1 swine flu in January 1976 at a US Army base in Fort Dix, New Jersey.

This outbreak affected 230 military personnel, killing one person, but it was successfully contained and was almost certainly caused by the direct transmission of swine flu from pigs. Nevertheless, the global anxiety caused by the Fort Dix outbreak led to a surge in research into H1N1 around the world, with experiments on frozen samples of the virus stored in labs since the 1950s, Dr Zimmer said.

"I would imagine that most labs researching into influenza would have had the 1950s strain. We cannot actually pinpoint which lab had it or accidentally released it, but the re-emergence of H1N1 in 1977 made it potentially a man-made pandemic," she said.

"It's a reminder that we need to be continually vigilant in terms of laboratory procedures. The identical virus in the current pandemic would not have occurred because a component of it comes from the H1N1 strain of 1977 – but it doesn't mean to say that we wouldn't have had another one causing a pandemic," she added.

One of the most likely routes for the release of the 1950s virus is that laboratory workers became infected accidentally and then infected families and friends, Dr Zimmer explained. After the 1977 pandemic, the H1N1 strain of flu re-appeared annually as seasonal flu but this year it underwent a radical genetic change to become another pandemic strain.

Professor John Oxford of the Royal London Hospital said that the accidental release of the 1950s strain of H1N1 in 1977 is entirely plausible, but it may have been a good thing as it would have given many older people alive today some measure of immunity to the current pandemic. "We can look upon it now as a stroke of good luck," he said.

Mail Online

Swine flu pandemic 'caused by accidental leak from laboratory

Daily Mail, 30 June 2009, 11:30 GMT
https://www.dailymail.co.uk/news/article-1196507/Swine-flu-pandemic-caused-accidental-leak-laboratory.html

The swine flu pandemic may have been caused by an accidental leak from a laboratory three decades ago, scientists have claimed.

An investigation into the genetic make-up of flu viruses claims the pandemic may not have occurred, had it not been for the accidental release of the same strain of influenza virus from a research lab in 1977.

The Independent reported that researchers believe this strain of the virus had been extinct in the human population for more than 20 years until it was unwittingly reintroduced by scientists.

The study in The New England Journal of Medicine said: 'Careful study of the genetic origin of the (1977) virus showed that it was closely related to a 1950 strain, but dissimilar to influenza 'A' (H1N1) strains from both 1947 and 1957.

'This finding suggested that the 1977 outbreak strain has been preserved since 1950. The re-emergence was probably an accidental release from a laboratory source.'

The strain is thought to be behind the pandemic in 1977 which began in Russia and China.

Shanta Zimmer from the University of Pittsburgh in Pennsylvania said: ‘We cannot actually pinpoint which lab had it or accidentally released it, but the re-emergence of H1N1 in 1977 made it potentially a man-made pandemic.

‘It’s a reminder that we need to be continually vigilant in terms of laboratory procedures.’

The release of the 1950s virus may have occurred after a laboratory worker became infected accidentally and then infected family and friends.

Professor John Oxford of the Royal London Hospital said the accidental release of the 1950s strain of H1N1 in 1977 is a plausible theory.

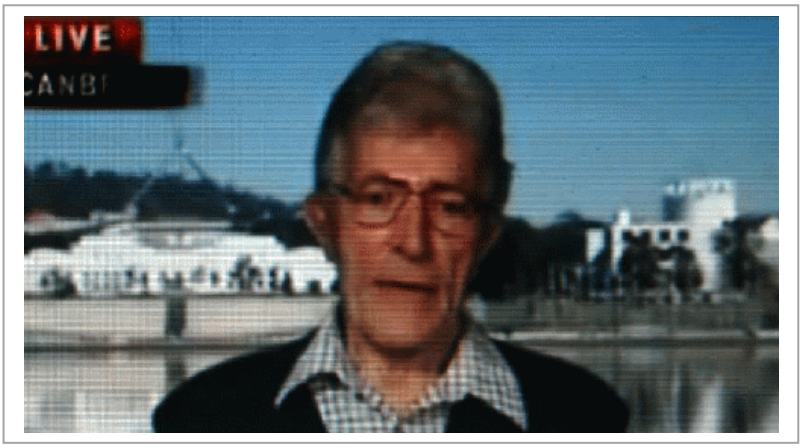
Peter Duveen

Virologist to make his case for lab origin of swine flu

OpedNews, 1 July 2009
https://www.opednews.com/articles/Virologist-to-make-his-cas-by-Peter-Duveen-090630-103.html

Peter's New York, Wednesday, July 1, 2009 – The scientist who made headlines in May by positing a laboratory origin for the swine flu that has swept the world will defend his theory in the scientific literature, Peter's New York has learned.

Dr. Adrian Gibbs, a Canberra, Australia-based virologist with more than 200 scientific publications to his credit, said that over the weekend he submitted his latest work on the swine flu to a prominent scientific journal, and is awaiting a response.



Gibbs, 75, was part of a team that developed the antiviral drug Tamiflu

Back in April, when the first cases of swine flu were diagnosed in Mexico, Gibbs examined the genetic structure of the virus that had been posted on a public database. His analysis led him to speculate that the virus may have been the result of a laboratory error. He contacted the Geneva, Switzerland-based World Health Organization with his conjecture, and scientists there scrutinized his findings, concluding, however, that the virus was most likely a product of nature.

In a series of email exchanges with Peter's New York, Gibbs said he was not satisfied with the WHO's critique, indicating that the basis for it was ambiguous.

"The WHO stated that they had no evidence to support my suggestion," Gibbs said. "They made a very fair statement. However the principle reason for my conclusion remains-that none of the genes of the new virus had been sampled/found/caused epidemics since at least 2000, despite probably coming from at least two different parents on two continents, where other strains had been sampled."

Gibbs said that might have been a coincidence, but the unusual placement of the virus on what what virologists call phylogenetic trees-a sort of schematic family history of the virus--also peeked his interest. On top of that, Gibbs observed that there was a lack of evidence that pig populations in North America, from which the virus is believed to have emerged, had been infected. Only the pigs on one farm in Canada have as yet been shown to have contracted the virus.

It has been established, said Gibbs, that swine easily contract the new flu from humans, and spread it among themselves. The absence of infection in the North American swine, Gibbs noted, may be evidence that the swine had already contracted the disease and built up immunity, or that they were vaccinated against viruses that resembled the novel swine flu closely enough for them to have been protected against it. Gibbs said the one Canadian herd that came down with the novel swine flu had not been inoculated, and that the evidence therefore leans toward inoculation as the reason North American pigs are disease free. That, in turn, would support a theory, according to Gibbs, that "the virus in the vaccine may be the immediate progenitor of the new human virus."

Gibbs said he would have been more satisfied if scientists at the WHO had examined the lists of all the vaccines licensed for production in the United States and Mexico and determined that none of them harbored strains from which the swine flu could have descended. He said he had been unable to locate such lists to make the determination himself.

Gibbs spells out fairly clearly how he thinks the new virus might have emerged due to a laboratory error. In manufacturing a vaccine, each of the viruses to be protected against must first be bred and then sterilized to prevent their further multiplication. When a subject is inoculated, the body reacts to the "killed" viral fragments and produces antibodies that provide protection against the live virus. Gibbs said that if the sterilization process was not carried out properly, pigs could end up being given live viruses, and instead of being protected, would contract the disease. The live viruses would then have a chance to multiply and exchange genetic material within the infected pig in a process known as reassortment, and a new virus could emerge and spread to humans as a "swine flu."

The study of viruses is overlaid with a complex nomenclature and labyrinthine concepts and arguments in the field of genetics that are unfamiliar to the average layman. But the implications are far reaching, a fact not lost on the general public or on Gibbs.

Early this year, the Deerfield, Ill. based drug firm Baxter International Inc. shipped experimental vaccines for human flu that were contaminated with the bird flu. The cocktail of influenzas, if it had not been discovered by alert laboratory specialists in the Czech Republic in February, could have been administered to subjects, after which, some experts feared, the two viruses could have undergone reassortment, producing a new virus that possessed the lethality of bird flu and the communicability of human flu. Bird flu is a deadly disease that kills close to half its victims, but resists spread from human to human. Human flu, on the other hand, is far more benign, but is easily spread through human contact. A recombined virus with the characteristics of each of the two could conceivably wipe out almost half the world's population.

Gibbs steers clear of elaborate intrigues that some believe are behind the new flu's emergence. "Whenever I've thought something has resulted from a conspiracy, it usually turns out to be from a 'co*k-up,'" he said. The importance of establishing whether or not the flu emerged from a laboratory, he emphasized, is "to try to avoid a recurrence."

He did admit, however, that there was a definite risk to the public of escaping pathogens held in government and private facilities.

"There are many historical precedents that are conveniently forgotten," said Gibbs. "The recent Baxter incident seems to have been one."

"The reappearance in 1977 of the H1N1 (virus) last seen in 1950 after a period of non-evolution," which he speculated could represent "suspended animation in a freezer," was another instance in which pathogens might have escaped from a laboratory. Gibbs also cited the escape of foot-and-mouth disease from a British government laboratory facility in 2007.

Asked if the resurrection of the viral agent for the deadly 1918 "Spanish" flu, which was reconstituted in 2005 by scientists at the Centers for Disease Control and Prevention for research purposes, was a safe proposition, he answered, "No, definitely not."

"It's exactly the same principle as should apply to all high security labs," said Gibbs. "If it ain't 'there' it can't get out, whereas if it is, then there is always the possibility, however remote, that it might get out."

The 1918 flu, which spread to every corner of the globe in the two years immediately following World War I, had a rate of lethality some 30 to 50 times greater than other strains of human flu. Tens of millions of people died in the pandemic worldwide.

While some aspects of his presentation have been updated, Gibbs said his basic premise remains unchanged, and has, in fact, been reinforced by recent additions to the scientific literature.

And while the WHO gave the appearance of having put the final nail in the coffin of Gibbs's theory, in a rare show of scientific honesty for a public institution, it affixed the lid rather loosely, leaving itself room to revisit Gibbs's hypothesis once it is published.

In the mid-May press conference in which the WHO addressed Gibbs's analysis, which by that time has spread far and wide throughout the mainstream media, Assistant Director Keiji Fukuda praised the virologist who had contributed to the field for more than fifty years of professional work, calling Gibbs "a credible scientist, a credible virologist."

In answer to a reporter's question about whether Gibbs's theory had been refuted, Fukuda said: "I think that it is fair to say that in the world of science, nothing is ever totally excluded, nothing is ever ended." On the issue of whether Gibbs's theory may actually prove true or not, he said: "We feel very comfortable based on the analyses which have been done, based on the rigor in which it has been looked at, that we are not dealing with a laboratory-created virus. However, I do not expect that the debate itself will stop."

More Deadly Swine Flu?
CDC Mixes H1N1, H5N1 Viruses in Tests

Wall SJ, 17 September 2009, 11:31 am ET
https://www.wsj.com/articles/BL-HEB-22887

Public-health officials are breathing a small sigh of relief that the H1N1 swine flu virus hasn't mutated to become more deadly since emerging last spring. But what are the chances it will?

To find out, scientists at the CDC recently launched experiments in the agency's labs in which they infected ferrets with both the new H1N1 virus and the highly lethal H5N1 avian flu virus to see if they might "reassort" to create a new hybrid.

The scientists want to know whether a combination of the H1N1 virus – highly transmissible, but not terribly deadly – and the H5N1 flu virus could create an easily transmissible, deadly scourge. The H5N1 virus has only sickened 440 people world-wide since 2003 and generally isn't transmitted from one person to another. But it has killed 262, or about 60%, of those people, according to the World Health Organization.

As the new H1N1 flu has spread, flu experts have kept a close eye on Egypt and parts of the world where human H5N1 infections are occurring too. The two viruses could mix if they infected the same person simultaneously. The new H1N1 virus was also detected recently in turkeys in Chile, proving that it has the capacity to jump to birds, another potential source for reassortment.

The CDC scientists don't have results of their lab experiments in ferrets yet, said Michael Shaw, associate director for laboratory science for the agency's influenza division. While the experiments could produce viable combinations of the two viruses, the real question is whether any could create a virus that would spread, he said. "Viability is one thing," he cautioned. "Whether it's easily transmissible is another."

Other experiments conducted so far suggest the new H1N1 virus isn't terribly prone to doomsday changes. Viruses can change through either mutation of genetic material, or by reassorting with another flu virus. The new virus is lacking certain characteristics that would allow it to mutate to become more virulent, said Nancy Cox, chief of the CDC's influenza division. "It would be difficult for this virus to acquire some of those known virulence markers," she said.

As for reassortment, so far the new H1N1 virus hasn't shown a penchant for mixing with other common flu viruses. In a research note published in late August on the Web site PloS Currents: Influenza, scientists infected ferrets both with the new H1N1 virus and common seasonal strains of H1N1 and H3N2 flu. The new H1N1 pandemic virus didn't reassort.

"Co-infection of seasonal and pandemic strains did not result in the rapid selection of reassortant viruses that either improved replication or transmission or exacerbated virulence," they concluded. The federally funded study was led by scientists at the University of Maryland.

Whatever any of the experiments show, CDC officials warn against drawing definitive conclusions. "Influenza is really unpredictable," Cox said.

H1N1 Swine Flu Virus Patented by Medimmune Back in 2008

Current News, 13 September 2009
https://web.archive.org/web/20091110080615/http://current.com/items/90938347_h1n1-swine-flu-virus-patented-by-medimmune-back-in-2008.htm

Medimmune Patented H1N1 Swine Flu Virus Back in 2008

New York: According to Dr T Ott, the Swine Flu patent is owned by none other than Medimmune who stands to profit around $151 million dollars from US taxpayers.

MedImmune:

MedImmune, LLC, headquartered in Gaithersburg, Maryland, became a wholly owned subsidiary of AstraZeneca in 2007. Since being acquired, MedImmune has remained a Maryland-based biotechnology development enterprise.

It produces Synagis, a drug for the prevention of respiratory infections in infants, which accounted for $1.06 billion of its $1.2 billion in revenue for 2005, and FluMist, a nasal spray influenza vaccine introduced in 2004.

FluMist was approved for children two years of age and older in 2007, but initially was approved only for healthy people ages 5 to 49, a significant limitation because it eliminated a significant market – the millions of young children who find injections objectionable. Sales of FluMist fell short of analysts' expectations for the first two years the drug was sold. FluMist was initially sold in a frozen form, which was difficult for doctors to store

According to MedImmune website they are making a signficant, rapid response with a vaccine to the H1N1 variant of influenza, known as Swine flu. In early June 2009 it won a Department of Health and Human Services (HHS) contract, worth $90m.

Under the contract with HHS, MedImmune will continue to make its seasonal FluMist vaccine and also develop a vaccine targeted specifically at the H1N1 virus MedImmune then won a second contract to test its nasal spray flu technology as a viable treatment for the H1N1.

And now according to Dr T Ott investigation Medimmune applied for and received the patient for Swine Flu Virus back in 2008.

But according to WHO "OFFICIALLY" H1N1 is created naturally and it's a new strain of influenza virus,first identified in April 2009.If so how could Medimmune get the patent for the same back in 2008?

In past we reported about how Baxter Files H1N1 Swine Flu Vaccine Patent a Year Ahead of Outbreak.

=> Influenza hemagglutinin and neuraminidase variants

https://patents.google.com/patent/EP1771552B1/en

11. A method for producing an influenza virus in cell culture, the method comprising:

i) introducing into a population of host cells, which population of host cells is capable of supporting replication of influenza virus, a plurality of vectors comprising nucleic acid sequences corresponding to:

(a) at least 6 internal genome segments of a first influenza strain, wherein the first influenza strain is not A/Ann Arbor/6/60; and, at least one genome segment encoding an immunogenic influenza surface antigen of A/VN/1203/04, wherein said surface antigen comprises the amino acid sequence of SEQ ID NO: 11; or

(b) at least 6 internal genome segments of a first influenza strain, wherein the first influenza strain is not A/Ann Arbor/6/60 and wherein said first influenza strain possesses one or more phenotypic attributes selected from the group consisting of: attenuated, cold adapted and temperature sensitive; and, at least one genome segment encoding an immunogenic influenza surface antigen of A/VN/1203/04, wherein said surface antigen comprises the amino acid sequence of SEQ ID NO: 11,

ii) culturing the population of host cells at a temperature less than or equal to 35°C in the presence of trypsin; and,

iii) recovering a plurality of influenza viruses.

Why Isn't the H1N1 Pandemic Flu Being Investigated as a Designed Bioweapon?

LewRockwell, 9 November 2009
https://web.archive.org/web/20100214132345/http://www.lewrockwell.com/sardi/sardi133.html

Strange as it may seem, in an era of heightened concern about biological terrorism, there appears to be little or no talk about the triple-reassortant H1N1 pandemic flu virus as a laboratory-designed bioweapon.

Certainly, this is not out of the question technologically. It is now entirely possible for scientists to artificially re-create an infectious agent from scratch. Researchers have demonstrated that a polio virus can be reduced to a chemical, $C_{332,652}H_{492,388}N_{98,245}O_{131,196}$-$P_{7501}S_{2340}$, and assembled by following its written genetic code. (Viruses are not live organisms, they are sequences of genes that must rely upon entry into a host cell nucleus to utilize the cell's genetic mechanisms for reproduction.) When a synthetically-created polio virus was introduced into the spinal cords of mice it created the same paralysis seen in polio.[1]

The synthesis of flu viruses became more than a possibility in 1999 when researchers demonstrated it was possible to overcome the previously insurmountable problem of arranging eight segments of RNA. This was accomplished by generation of RNA using an enzyme, RNA polymerase, essentially creating a cloned flu virus.[2]

Fear spreads faster than the flu

Certainly imagined rather than factually-based fear is at the core of concern over this H1N1 pandemic flu outbreak. Tuberculosis, another infectious disease, globally kills nearly 2 million every year, compared to 250,000–500,000 from the flu, but a $9 billion effort to eradicate it is not mounted against TB as has occurred with the 2009 *"swine flu."*

The late–flu season introduction of the pandemic, starting in Mexico in March of 2009, creates a similar frightening scenario to the 1918 Spanish flu outbreak that killed millions worldwide. If an engineered virus, its late-season introduction could be evidence of an intentional effort to panic human populations.

If designed, it was intended to spread, not kill. It lacks the PB1-F2 marker for pathogenicity (tissue damage) seen in the dreaded but poorly transmitted H5N1 bird flu virus that drew concern in 2003.[3] Yet, in vulnerable individuals, those with pre-existing disease or smokers or pregnant females, there is a greater (though still small) risk of death.

Wishy-washy origins

Researchers attempt to explain that this unique flu virus *"was derived from several viruses circulating in swine, and that initial transmission to humans occurred several months before recognition of the outbreak."* Without evidence in hand, the world community of virologists concluded that this virus *"emerged from a triple reassortant virus circulating in North American swine."* Yet no mass culling of herds of swine was called for.[6]

The swine origin of this flu is nonsense since no swine herds exhibited this virus till detection months following the initial flu outbreak in Mexico, suggesting it was transmitted from humans to pigs, not the other way around. Using pigs as a cover for the true origin of the disease also suggests a broad cover-up within the community of microbiologists and public health authorities.

For factual documentation, the first detection by the US Department of Agriculture of H1N1 pandemic influenza in pigs in the US occurred between August 26 and September 1 at the Minnesota State Fair, almost 6 months after the first case in Mexico.[4]

However, this fact was not revealed till months later, claimed to be an effort to protect US pig farmers when their business had already been destroyed by association of this flu virus with flu strains commonly found in swine herds.[5]

Researchers go on to say, in a confusing and inexplicable fashion, that *"a phylogenetic estimate of the gaps in genetic surveillance indicates a long period of unsampled ancestry before the swine-flu outbreak, suggesting that the reassortment of swine lineages may have occurred years before emergence in humans, and that the multiple genetic ancestry of this swine flu is not indicative of an artificial origin."*[6]

Here is intentional wording to dismiss any thought of an engineered virus. Yet the authors of this report are suggesting the many flu-monitoring stations across the globe completely missed detection of this virus as it mutated and re-assorted into its current form. Yet there has been no call to check for flaws in classifying viral strains which would have obviously occurred.

These researchers go on to say, that without samples of its ancestors, the immediate origin of this flu strain is difficult to determine. The closest relatives to this flu strain existed between 9.2 and 17.2 years ago, *"depending upon the genetic segment"* analyzed. Investigators claim it must have been circulating in pigs *"for several years"* before emergence in humans.[6]

Its Asian-origin flu strain segments lead researchers to blame the movement of pigs between Eurasia and North America for its unique viral re-assortment. Yet shipment of swine herds is one way, from North America to Asia, and there are quarantine periods so that new arrivals don't infect an existing herd. Influenza lasts only a few days and quarantine methods would eliminate any transfer to another herd. Unlike humans, pigs produce their own vitamin C and swine herd flu outbreaks are typically mild and not mortal.

Warning of influenza as a bioweapon

In 2003 researchers at the Center for Biosecurity and Public Health, University of Texas–Houston Health Center, Houston, Texas, warned that influenza could be made into a bioweapon to produce disease and death of major proportion. Unlike other biological threats like anthrax, influenza only requires 3 to 6 airborne viral particles, 27,000 times fewer viral particles than obtained by direct contact (hands) to produce infection. In 1–4 days, its incubation period, it can start replicating and producing symptoms of diarrhea, vomiting and coughing serious enough for hospitalization and use of a respirator. Its victims often succumb to a sudden mortal heart attack, which does not directly end up on statistical health summaries as flu-related death.[7]

Once a flu pandemic has begun it is difficult to halt because immunization after exposure to the flu is not protective, and anti-flu drugs (Tamiflu, Relenza) must be administered before symptoms develop or within the first 48 hours after their appearance. Early on, flu symptoms may appear similar to other biological threats like anthrax, so it is difficult to ascertain that a human population is under an intentional biological attack.[8]

Flu viruses evolve to protect humanity?

Jeffery K. Taubenberger, M.D., Ph.D. Senior Investigator in National Institute of Allergy & Infectious Diseases, and Anthony S. Fauci, M.D., Director of that Institute, say theH1N1 pandemic flu is afourth-generation descendantof the 1918 virus.

This virus caused an explosiveand historic pandemic, during which humans also transmittedthe virus to pigs, they concede. Taubenberger and Fauci take evolutionary theory to the height of its absurdity by stating:

"… successive pandemics and pandemic-likeevents generally appear to be decreasing in severity over time.This diminution … may reflect viral evolutionary'choices' that favor optimal transmis-sibility with minimal pathogenicity – a virus that kills its hosts or sends them to bed isnot optimally transmissible."

Huh? We've heard of *"survival of the fittest,"* and *"natural selection"* (where heritable traits make it more likely an organism will survive and successfully reproduce itself), but here we have a new and novel definition of evolution – the flu virus genome is selecting against its own survival in preference to survival of humans![8]

How a tailored flu virus would be produced

In 2003 Robert M. Krug, writing in the journal Antiviral Research, wrote a landmark report entitled *"The potential use of influenza virus as an agent for bioterrorism."*

Krug said: "If such a lethal human influenza A virus does not emerge in nature, it is likely that it can be generated in the laboratory, utilizing the recently developed reverse genetic system, whereby influenza viruses can be generated by transfection (a process of introducing nucleic acids into cells) of multiple DNAs."[15]

This can be accomplished by transiently opening pores or holes in the cell membrane to allow entrance of viral particles. In fact, the deadly H5N1 bird flu virus (kills 6 in 10 infected humans) has already been generated in at least one laboratory at the University of Wisconsin using this reverse genetic system.[9]

This topic was covered in my LRC article entitled *"The Deadliest Flu Virus In The World."*[10]

Krug writes: "There is every reason to believe that the same recombinant DNA techniques can be used to render this H5N1 virus transmissible from humans to humans. Furthermore, it should be possible to introduce mutations into such a recombinant virus so that it is resistant to currently available influenza virus antivirals (M2 inhibitors: amantadine and rimantadine; and NA inhibitors: zanamivir and oseltamivir-Tamiflu and Relenza), and so that it is unlike…. recently circulating human viruses. In fact, several viruses (at one time) … could be generated. The human population would lack immunological protection against such viruses, existing antiviral drugs would not afford any protection, and these viruses could be spread simply by release of an aerosol spray in several crowded areas."[15]

In this instance, if the current H1N1 pandemic flu virus was engineered, it was designed to be vulnerable to Tamiflu and Relenza, but not amantadine and rimantadine. With the current delay in delivery of the vaccine, one wonders if this whole pandemic hasn't been engineered to deplete aging stocks of Tamiflu that nations have been piling up in anticipation of *"the big one"* – the supposed long-overdue *"great flu pandemic."*

The question is, could there be some villainous bioterrorist in some foreign country who has the capability of covertly starting a flu virus in a remote village in Mexico, and only infect one child there, and then see it spread around the world? If so, this flu pandemic actually petered out by July of 2009, as CBS News uncovered, but re-emerged in the following months as the dominant strain of flu virus in circulation.[11]

Pandemic flu strains predominates

Was this pandemic strain of the flu re-introduced or re-engineered at that time, to make it more prevalent?

The current strain of the flu in circulation as of the first week in November 2009 is 99% H1N1 pandemic strain. The seasonal flu strains have vanished. There is no need to undergo vaccination for seasonal flu. Health authorities knew some time ago that the H1N1 pandemic flu strain overwhelms seasonal flu strains. The exact date of that discovery is unclear because we only have the date of publication of that discovery. The first evidence for this was produced some time earlier.[12]

Whether a biological terrorist re-introduced the H1N1 strain into North American human populations after it was fizzling out in July is certainly speculation, but is a question that needs asking.

Laboratory origin: no amateur bioterrorists

Krug goes on to say: "It can be argued that most terrorists would not have the knowledge, facilities and ingenuity to carry out these recombinant DNA experiments. This is probably the case at the present time, but the situation can be expected to change in the future, perhaps after as little as 5–10 years."[15]

Currently there is no revealed intelligence that there is a nefarious bioterrorist at large developing pandemic flu viruses. If the current pandemic flu strain in circulation was designed in a laboratory, it would likely be a university or military lab, just as the origin of anthrax was traced back to the Army lab at Fort Detrick in Maryland.[13]

We should also not forget that the news media repeatedly attempted to distract the public as to the real origins of the anthrax, falsely suggesting the bentonite additive found in the anthrax samples, spread in the ventilation ducts at offices of US Congressmen in Washington DC, originated in Iraq, the only country known to use that additive. A false connection was being made between the anthrax and Iraqi leader Saddam Hussein by ABC chief investigative correspondent Brian Ross on October 26, 2001, shortly following the attacks on the World Trade Center in New York.[14] So the public should be wary of the news media that may be complicit with other sources to create politically-correct conclusions as to the origin of the H1N1 swine flu.

Vaccination strategy is inherently flawed

Krug goes on to say: "Vaccination will probably be of limited value against an influenza virus bioterrorist attack. Currently it takes about 6 months to prepare a vaccine against a new influenza virus strain. Perhaps reverse genetic approaches can shorten this time somewhat, but there will still be a few months between an influenza virus outbreak and the availability of a protective vaccine. In addition, the vaccine approach can be readily thwarted by bioterrorists who could spread several influenza viruses with different HA antigenic sites."[15]

So the current effort to control influenza, largely being centered on vaccination, is flawed and should be curtailed. Of course, that is not what is being played out in the currently unfolding vaccine drama

Only antivirals are left in defense

Krug then says: *"In contrast, antiviral drugs that are directed at functions shared by all influenza A virus strains constitute the best line of defense against a bioterrorist attack. Currently the NA (neuraminidase) inhibitors (zanamivir and oseltamivir-Tamiflu and Relenza) are the only such antivirals available."*[15]

Stockpiles of anti-viral drugs, which now proliferate across the globe, could become useless due to limited shelf life. So far, manufacturers have been testing and extending the shelf life of their anti-viral products. The World Health Organization holds 2 million treatment courses of Tamiflu and another 3 million courses are held in stock by Roche as part of their rapid response stockpile.[16]

Anti-virals are somewhat effective in prophylaxis of the flu, but over-use of these anti-viral drugs induces viral resistance.[17]

It is interesting to note that 99.6% of the 2008 seasonal flu strains were resistant to Tamiflu.[18] To move Tamiflu off of shelves, the seasonal flu had to vanish, which is exactly what has occurred. This suggests aerosol flu viruses are being seeded into the population to create designed flu pandemics.

Vaccine makers, government, presage the pandemic

As mentioned earlier in this report, the H1N1 pandemic flu now in circulation has virtually overtaken all other flu strains, as if by design, in an apparent attempt to deplete the millions of doses of Tamiflu whose shelf life expires in 2009–2010. The US has a stockpile of over 50 million doses to clear off its shelves that outdates soon.[19]

For unexplained reasons, in 2008 the manufacturer of Tamiflu in Japan projected a 531% increase in sales in 2009, as if presaging the flu pandemic now underway.[20]

Has this whole flu escapade, its late-season onset, the otherwise inexplicable delays in delivery of the vaccine, been staged to dump millions of nearly-outdated Tamiflu pills on the world masses who have been whipped up into flu hysteria?

On June 27, 2008, nearly 8 months prior to the first reports of the H1N1 pandemic flu emanating out of Mexico, the maker of Tamiflu began urging companies to buy stockpiles of their product, a sales effort that was endorsed by the Department of Health & Human Services. This suggests massive collusion between the makers of anti-viral drugs and public health authorities in staging this pandemic.

On June 27, 2008, a deputy secretary for the Department of Health & Human Services is quoted as saying: *"I think the (Tamiflu) program is unprecedented in that we are facing an unprecedented threat."*[21] Exactly which unprecedented flu threat was this government employee talking about at the time?

Brendan Maher, Declan Butler

Swine flu: One killer virus, three key questions

Nature, 12 November 2009; 462(7270): 154-7
doi: 10.1038/462154a. PMID: 19907469
https://archive.org/details/one-killer-virus-three-key-questions/

As the world mobilizes against the H1N1 flu pandemic, researchers are working to answer pressing questions about the virus. *Brendan Maher* visited pathologists at the US Centers for Disease Control and Prevention who are looking at how the virus kills, and a New York laboratory that is testing how it spreads. *Declan Butler* spent time at a French biosafety level-4 facility where researchers are working out the chances that the pandemic virus will reassort with the H5N1 avian flu virus.

1. How does it kill?

There are five seis of eyepieces on the microscope and Sherif Zaki is looking down one of them. Looking down the other four are members of the team he leads at the infectious-disease pathology branch at the Centers for Disease Control and Prevention (CDC) in Atlanta, Georgia. Other researchers trained in epidemiology, microbiology and electron microscopy watch a large, flat-screen monitor at the end of the narrow conference room that shows an image projected from the microscope.

Dianna Blau, an epidemiologist, reveals the source of the tissue: an 11-year-old girl who died in September, probably from H1N1 influenza. The team had already detected viral RNA in the girl's sample. But observing the presence of the H1N1 virus, especially in this tissue from deep down in the lungs, provides a more accurate and detailed diagnosis. The tissue seems messy, and is flooded with blue-stained *Staphylococcus aureus*. Zaki scans back and forth across the slide, seeking the hint of red staining that would indicate the presence of antibodies bound to the H1N1 virus. He finds it on one slide, where a red blob indicates a profusion of virus being released from a rupturing cell. They mark her as positive.

Zaki's lab holds these 'sign out' meetings every afternoon, examining autopsy and other tissues that have been sent to the CDC from doctors and medical examiners around the world to find. confirm or rule out any number of diseases. Since April, their caseload has doubled thanks to H1N1. So far, the group has received samples from more than 300 suspected cases, and it has confirmed swine flu in more than a third of them.

In addition to providing a diagnosis, the group analyses are helping to build up a picture of how the virus kills. Pathological studies can show, what tissues are affected and to what extent, adding detail to the worldwide monitoring and surveillance efforts.

The profile emerging is of a distinctive virus. Although seasonal flu tends to infect just the cells high in the upper airway, H1N1 penetrates down into the terminal air sacs called alveoli. "This is not an area of the lung where you would usually see seasonal flu," Zaki says. He has seen such behaviour before, though – in the few samples of lung tissue he has examined from humans killed by the H5N1 avian flu virus. Bin the virus is much more prevalent in the tissues from the severe H1N1 cases he has examined – "like avian flu on steroids" as Zaki puts it

Zaki says that his observations fit well with recent research looking at the mechanism of infection. A group led by Mikhail Matrosovich at Philipps University Marburg in Germany and Ten Feizi at Imperial College London studied sialyl glycans, glycoproteins that the flu virus binds to in order to gain entry to human cells.[1] Although seasonal strains of H1N1 bind mostly to versions of the glycoproteins known as α2-6, the researchers found that the new pandemic H1N1 can also bind to a version called α2-3, which is found in greater proportion in the lower respiratory tract.

Co-infection is common with pandemic H1N1, at least in those who have died. Zaki's group has observed infection with bacteria such as *S. aureus* or *Streptococcus pneumoniae* in about a third of the fatal swine-flu cases it has examined. In the rest, the virus seems to be lethal on its own. Zaki slots onto the microscope stage a slide from a 38-year-old male who died without bacterial co-infection. This one is filled with the red staining; also the walls of the alveoli are ruptured and blood cells and fluid fill the spaces normally reserved for gas exchange. Scar-like pink ribbons, called hyaline membranes, arc through the tissue. Pathologists call this state 'diffuse alveolar damage', and it tells them that the man had respiratory distress syndrome. "It's very difficult to treat a patient once they get to this state," Zaki says. He points out that the man was obese and had a history oa hypertension and heart problems. Some 90% oa the cases his team has reviewed have had some underlying medical condition.

Zaki says that they plan to publish some of their observations soon, and he has been sharing them with others at the CDC and with the public-health community at large. Although pathology can't pro.kt what the virus will do in the future, it can help to identify those most at risk of severe disease. "We've really learned a lot with the lab pathology," says Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases. "Both the prominence of the pneumonia in some infections and bacterial co-infection have important clinical implication," she says, explaining that pathology results have led the CDC to recommend pneumococcal vaccination for people in at-risk groups.

At the end of the sign-out meeting, Zaki walks back to his office through a quiet lab; the technicians have gone home for the day and the machines used to prepare and stain slides are silent. Six fresh case studies in purple folders sit in a neat row along one of the lab benches ready for processing and examination. They contain slides or tissue embedded in paraffin; one still has lumps of formalin-soaked flesh sitting in a plastic specimen jar.

As the flu season ramps up, Zaki says, he suspects the number of flu cases will increase dramatically. Still, his lab sees only a small slice of what's happening worldwide. "We're looking at the tip of the iceberg in terms of these cases," he says. It's a grim toil, reading the tales of the dead, but he adds "that information is important for the living".

Brendan Mahar

2. How does it spread?

In a cramped locker room high above the streets of upper Manhattan, laboratory personnel take a visiting journalist into the emerging facility, an enhanced biosafety level 3 (BSL-3) laboratory on the New York campus of Mount Sinai School of Medicine.

The suiting up procedure is complicated. Rubber- soled booties must be tucked under a jumpsuit to ensure that spilled fluids don't drip into them. Purple latex gloves are layered underneath green ones; the different colours are used to ensure that rips in the outer layer are visible. Black N95 face masks pinch off the nostril,. forcing the wearer to breathe noisily through his or her mouth. The staff call them Darth Vader masks. They also wear papery mesh scrubs and white 'bunny suit' coveralls made from the material used to insulate houses. Biosafety officer Philip Hauck quotes Dante as he prepares to go in: "Abandon all hope ye who enter here."

In another preparatory room, they add heavy, belted, battery-powered air filters with a hose that hooks into the back of a white head-covering. Once it adjusted, air begins rushing up over the face, puffing up the suit. The positive pressure in the suit, combined with the negative air pressure in the lab, ensures that the flow of air will carry any airborne pathogens away from the body.

This is the procedure that researchers at Mount Sinai go through every day to carry out their animal studies on deadly pathogens. Since May, pandemic H1N1 has been one of those pathogens. As the pandemic was emerging, John Steel and Anice Lowen secured strains of novel H1N1 from California and the Netherlands, and made plans to include them in their work modelling the transmission of influenza in guinea pigs. BSL-3 facilities are not required to work with H1NI, but Steel and Lowen's institutional review boards wanted the work to be carried out under the most stringent conditions on site.

Many labs use ferrets to model the transmission and pathology of human viruses, but the animals can be difficult to work with. Peter Palese, the head of microbiology at Mount Sinai, came up with the idea to work with guinea pigs a few years ago after reading an article published after the 1918 influenza pandemic, in which researchers in New Meiko noted that the infection had killed off a number of laboratory guinea pigs.[2] He convinced Lowen and Steel, assistant professors in his lab, to test whether the creatures would transmit human influenza. They did. In 2006, the group showed that the guinea pigs pass the virus between them with about the same efficiency as humans,[3] and the researchers still use them as a model of transmission even though their animals, purchased from a lab supplier, do not show symptoms or die from the disease.

The first thing the researchers did with the samples of pandemic H1N1 was to compare its transmissibility with that of seasonal flu. They squirted about l0,000 infectious H1N1 particles up the noses of four guinea pigs and, a day later, placed these animals in cages next to uninfected animals, separated by wire-mesh walls that allow respiratory droplets to pass through. Within five days all the exposed animals tested positive for the virus. The team's paper published last month in the *Journal of Vingiogy*, suggests that the H1N1 swine flu virus transmits just as efficiently as seasonal flu.[4] This is contrary to some work on transmission done at the start oa the pandemic[5] but mirrors real-world data showing that H1N1 spreads rapidly. "The pandemic sort of scooped us," says Lowen. Palese's group also found that previous exposure to the H1N1 and H3N2 subtypes of seasonal influenza limas the ability of exposed animals to become infected with the pandemic H1N1 which supports the idea that a seasonal flu infection or vaccine might offer some cross-protection against swine flu.

Inside the facility are the huge steel ferret cages that Steel and Lowen have adapted for their guinea-pig work so that two animals can fit inside each. They are now planning new imperunents, hoping to find the sequences within the genome that enable the virus to transmit so well between humans compared with other swine adapted influenza strains. They may create reassortments of the virus and then test how well they are transmitted by the guinea pigs. The results might aid in surveillance efforts aimed at identifying other strains from animals that cuuld make the leap to humans.

Everything that goes into the BSI-3 lab must be decontaminated before coming out. This involves spraying down the bodysuit with ethanol, carefully peeling it off and then leaving the facility by way of a shower room. A pen and notepad won't survive the caustic chemical dunk by the exit, so the pages are scanned and put onto a CD that can be sprayed down.

Outside again on the Manhattan streets, H1N1 could be encountered in any cough or sneeze. Without all the protective gear, one feels rather vulnerable.

Brendan Maher

What could it turn into?

A deadly line up of viruses is locked up in the computer-controlled safes at the Jean Merieux/ INSERM biosecurity level four (BSL-4) facility in Lyon, France, including Ebola, Nipah, Lassa, Hendra and Marburg. And in the next few weeks, scientists working there are planning to manufacture a new resident They hope to test whether the highly transmissible pandemic H1N1 virus could reassort with its deadlier cousin, the H5N1 avian flu, to make a virus with the worst properties of both.

Classed as a national high-security facility, the laboratory is a three-storey shoebox made from armoured glass, perched above a biology research centre of INSERM, the national biomedical agency. The edifice is built to withstand earthquakes, bullets and explosives. It is also smack in the city centre, its entrance just metres from mothers pushing prams along the pavement on avenue Tony Garnier.

The lab itself is surrounded by empty corridors and a spartan decor of steel staircases, trusses raised walkways and ventilation pipes. The air hums from the air-ultrafiltration and ether support machinery that take up entire floors above and below. Under negative air pressure to stop viruses escaping in the event of a breach, the lab is split into three zones, with the airstream flowing towards the 'hottest' exposure risk zone, the animal house at the back.

When the current H1N1 pandemic began in April, priority lab time here was allocated to Bruno Lina, a virologist and flu researcher at the CNRS, Erance's basic-research agency, who works at the University of Claude Bernard Lyon-1. Pandemic H1N1 influenza is not itself a BSL-4 agent – a BSL-2 facility is adequate. But in France, the health ministry classes viral reassortment experiments of the sort Lina is performing as requiring BSL-4 precautions.

The ability to predict which reassortments might take place, and what type of flu viruses might result, could be key to predicting the behaviour of this and future pandemics. The eight genes in the influenza virus's segmented genome are easily swapped between strains. But to be viable, new gene combinations must also be able to work together to package themselves into a virus particle. Viruses within a subtype tend to reassort with one another more easily and generate more viable reassortarirs than do those from different subtypes.

Over the summer, Lina's team has been using the BSL-4 facility to investigate the likelihood that pandemic H1N12 will acquire resistance to the front-line antiviral drug oseltamivir (Tamiflu) through reassortment, and how easily these reassortants might spread. Resistance can emerge by spontaneous mutation, but given that seasonal H1N1 is already resistant to the drug and spreads easily, reassortment is perhaps the most likely way that H1N1 will acquire resistance – especially as seasonal H1N1 and pandemic H1N1 are the same subtype. Since the start of the pandemic, Tamiflu-resistant strains have sporadically appeared in several countries but none has yet gained a foothold. That they haven't arisen more often or spread more easily may be because there is little seasonal H1N1 circulating, as pandemic H1N1 is outcompeting it – a large number of co-infections are needed for transmissible reassortants to arise.

In his work Lina co-cultured the two H1N1 viruses in a cell line. He is now testing how pathogenic the reassortants are in mice, before using ferrets to test their capacity to spread. The biggest hazard that the scientists face in the lab is a bite or a scratch from an infected animal, so all manipulations are done on animals that have been anaesthetized remotely.

Lina is also preparing to submit a protocol to the facility's scientific board seeking the green light to try to reassort pandemic H1N1 and the H5N1 avian flu virus. "It's controversial research, but it is basic science that needs to be done," says Lina. H5N1 has killed more than half of the people it has infected since it resurged in 2003, but has rarely spread from one person to another. H1N1, on the other hand, seems to be as transmissible as seasonal flu, but mild in most people, if severe in some. The aim of Lina's proposal is to find out the probability of a reassortant arising that combines the lethality of H5N1 with the transmissibility of H1N1.

In particular, Lina is searching for putative molecular controls of the virus's segmented genome that may determine why some reassortants can package the virus and others can't. "We don't know which regions in H5N1 are responsible for that control," says Lina. That could have benefits for disease surveillance, he says if researchers know the key genetic regions that facilitate reassortment, surveillance efforts could watch out for H5N1 or H1N1 viruses with changes in those regions, ones that might be on the verge of dangerous reassortments.

Lina will use reverse genetics to generate a soup of reassortants, test whether any are viable, and if they are, assess their virulence and transmissibility. Because H1N1 and H5N1 are different subtypes, Lina does not expect them to swap genes easily. In 2005, he tried to reassort H5N1 with seasonal H1N1 and H3N2 viruses, without success. "After a year we only had three reassortants, and none was fit," recalls Lina, "they just don't reassort well."

The expenments that Lina's team is carrying out in the BSL-4 lab aren't technically novel or difficult in themselves. But the encumbrance of the safety procedures for getting in and out of the high-security lab make even the most straightforward procedures complicated, says Lina. Looking through the bulletproof window, one can see why. As the researchers move around the lab, they connect their blindingly white spacesuits from some 60 yellow air hoses dangling from the ceiling. The hands of the researchers snipping away at tissue samples are wrapped multiple layers of gloves to avoid accidental pricks. "It's like trying to do surgery wearing boxing gloves," says Hervé Raoul, director of the facility.

Before researchers can even begin to work in the lab, they must pass a three week training course. It's only after a further 200 hours of practice that they are given any real autonomy to the lab, and they are never allowed inside alone. Users are limited to working a maximum one four-hour shift a day, so that they are less likely to make mistakes. They are also encouraged to share any concerns about the behaviour of colleagues, or whether they themselves are going through a difficult patch, which might cause distraction and accidents.

Before Lina's experiments get approved, the facility's external scientific board will need to be convinced of the public-health jrsstitication, that the science is top-notch and that the experiments can be done safely, says Raoul. It will also need to be approved by government regulatory agencies. If all goes well, he could have his aithonzanon in weeks, Lina says.

"Compared to big guns in flu research, I'm a little guy," says Lina. "But having access on my doorstep to one of the rare BSL-4 facilities in the world with an animal house is a big advantage."

From where did the 2009 'swine-origin' influenza A virus (H1N1) emerge?

Virol J. 24 November 2009, 6: 207.
doi: 10.1186/1743-422X-6-207. PMID: 19930669; PMCID: PMC2787513.
https://pubmed.ncbi.nlm.nih.gov/19930669/

Abstract

The swine-origin influenza A (H1N1) virus that appeared in 2009 and was first found in human beings in Mexico, is a reassortant with at least three parents. Six of the genes are closest in sequence to those of H1N2 'triple-reassortant' influenza viruses isolated from pigs in North America around 1999-2000. Its other two genes are from different Eurasian 'avian-like' viruses of pigs; the NA gene is closest to H1N1 viruses isolated in Europe in 1991-1993, and the MP gene is closest to H3N2 viruses isolated in Asia in 1999-2000.

The sequences of these genes do not directly reveal the immediate source of the virus as the closest were from isolates collected more than a decade before the human pandemic started.

The three parents of the virus may have been assembled in one place by natural means, such as by migrating birds, however the consistent link with pig viruses suggests that human activity was involved.

We discuss a published suggestion that unsampled pig herds, the intercontinental live pig trade, together with porous quarantine barriers, generated the reassortant.

We contrast that suggestion with the possibility that laboratory errors involving the sharing of virus isolates and cultured cells, or perhaps vaccine production, may have been involved. Gene sequences from isolates that bridge the time and phylogenetic gap between the new virus and its parents will distinguish between these possibilities, and we suggest where they should be sought.

It is important that the source of the new virus be found if we wish to avoid future pandemics rather than just trying to minimize the consequences after they have emerged. Influenza virus is a very significant zoonotic pathogen. Public confidence in influenza research, and the agribusinesses that are based on influenza's many hosts, has been eroded by several recent events involving the virus. Measures that might restore confidence include establishing a unified international administrative framework coordinating surveillance, research and commercial work with this virus, and maintaining a registry of all influenza isolates.

Scientist repeats Swine Flu lab-escape claim in published study

Bloomberg, 24 November 2009, 04:10 EST

https://web.archive.org/web/20130302172731/http://www.bloomberg.com/apps/news?pid=newsarchive&sid=ajw2AS.d1wK8

Nov. 24 (Bloomberg) – Adrian Gibbs, the virologist who said in May that swine flu may have escaped from a laboratory, published his findings today, renewing discussion about the origins of the pandemic virus.

The new H1N1 strain, which was discovered in Mexico and the U.S. in April, may be the product of three strains from three continents that swapped genes in a lab or a vaccine-making plant, Gibbs, and fellow Australian scientists wrote in Virology Journal.

The authors analyzed the genetic makeup of the virus and found its origin could be more simply explained by human involvement than a coincidence of nature.

Their study, published in a free, online journal reviewed by other scientists, follows debate among researchers six months ago, when Gibbs asked the World Health Organization to consider the hypothesis. After reviewing Gibbs' initial three-page paper, WHO and other organizations concluded the pandemic strain was a naturally occurring virus and not laboratory-derived.

"It is important that the source of the new virus be found if we wish to avoid future pandemics rather than just trying to minimize the consequences after they have emerged," Gibbs and colleagues John Armstrong and Jean Downie said in today's eight- page study.

Gibbs and Armstrong are on the emeritus faculty at the Australian National University in Canberra and Downie is affiliated with the Centre for Infectious Diseases and Microbiology Laboratory Services at Sydney's Westmead Hospital, according to the study.

While the exact source of the new H1N1 strain is a mystery, their research has "raised many new questions," they said. The authors compared the genetic blueprints of flu strains stored in the free database Genbank and found the pandemic virus's nearest ancestors circulate in pigs.

'Simplest Explanation'

While migratory birds may have acted as conduit for their convergence, human involvement in bringing them together is "by far the simplest explanation," Gibbs said in a telephone interview today.

Gibbs wrote or coauthored more than 250 scientific publications on viruses, mostly pertaining to the plant world, during his 39-year career at the Australian National University, according to biographical information on the university's Web site.

"Knowing Adrian Gibbs, he will have thought through it pretty logically and come to that conclusion," Lance Jennings, a clinical virologist with Canterbury Health Laboratories in Christ-church, New Zealand, said in a telephone interview. "It's up to someone else to try and prove it or disprove it."

Pandemie-Szenario: Schweinegrippe könnte Labor-Unfall sein

Financial Times, Deutschland, 24 Novembre 2009, 18:55
https://web.archive.org/web/20091127003734/http://www.ftd.de/wissen/mensch/:pandemie-szenario-schweinegrippe-koennte-labor-unfall-sein/50041878.html

Das Schweinegrippe-Virus könnte entstanden sein, weil in einem Labor schlampig gearbeitet wurde - das behauptet zumindest ein australischer Forscher. Die WHO dagegen geht von einem natürlichen Ursprung aus.

Die Theorie des pensionierten australischen Virologen Adrian Gibbs von zum Ursprung der Schweinegrippe hört sich an wie ein Szenario aus einem Katastrophenfilm: Da basteln einige Wissenschaftler im Labor an einem Impfstoff gegen verschiedene Grippeviren, die Schweine befallen. Arbeiten vielleicht nicht ganz sauber. Oder infizieren Zelllinien zur Zucht der Viren mit mehreren Erregerstämmen. Erbgutschnipsel aus drei verschiedenen Stämmen vereinen sich zu einem neuen Virus, der Menschen befallen kann. Ein Labormitarbeiter trägt den Grippeerreger nach draußen - und eine weltweiten Pandemie beginnt.

Tatsache ist: Der Ursprung des Schweinegrippe-Virus ist nach wie vor unbekannt. Bestandteile seines Erbguts weisen Ähnlichkeiten mit acht verschiedenen Grippeviren auf, die zwischen 1983 und 2004 bei Menschen, Vögeln und Schweinen entdeckt wurden. Gibbs kommt in seinen Untersuchungen zu dem Ergebnis, dass der neue H1N1-Erreger vermutlich auf drei Virenstämme zurückgeht, die in der Vergangenheit Schweine in den USA und Eurasien befielen.

Wissenschaftler gehen davon aus, dass die ursprünglichen Virenstämme durch Zugvögel oder den Handel mit Schweinen von einem Kontinent zum anderen gelangten. In einem Tier, das von unterschiedlichen Erregern befallen war, entstand schließlich der neue Virus. Gibbs hingegen hält das Zusammentreffen der Ursprungsstämme in einem Labor für wahrscheinlicher: „Es wäre bei Weitem die einfachste Erklärung."

Bereits im Mai dieses Jahres legte er der World Health Organisation (WHO) seine Theorie vor. Nun veröffentlichte er die Hypothese gemeinsam mit zwei Kollegen in der Online-Fachzeitschrift *Virology Journal*. Das Forscherteam schreibt: „Es ist wichtig, dass der Ursprung des Virus aufgedeckt wird, wenn wir Pandemien zukünftig verhindern wollen, statt nach ihrem Auftreten nur die Konsequenzen zu bekämpfen."

Massentierhaltung begünstigt Grippe bei Schweinen

In der Fachwelt wird Gibbs Hypothese skeptisch betrachtet. Bereits die WHO kam nach Begutachtung seiner Argumente zu dem Schluss, das Virus sei auf natürlichem Wege entstanden. Auch Thomas Vahlenkamp, Leiter des Instituts für Molekularbiologie am Friedrich-Loeffler-Institut, sagt: „Völlig ausschließen kann man die Entstehung des Virus im Labor nicht. Aber ich halte es für äußerst unwahrscheinlich, nahezu unmöglich."

Es könne gut sein, dass sich ein Vorläufer des Virus in einer Schweinepopulation entwickelt habe und dort lange Zeit unentdeckt geblieben sei. Aus Tieren in Südamerika und Südostasien seien beispielsweise nie Viren isoliert worden. Wissenschaftler gehen davon aus, dass besonders die

Massentierhaltung die Entstehung neuer Virenstämme begünstigt. Die Schweine sind nicht nur auf engstem Raum zusammengedrängt und stecken sich leichter an. Auch ihr Immunsystem ist durch die schlechten Lebensbedingungen geschwächt.

Der erste Mensch infizierte sich im April in Mexiko mit dem neuen Grippevirus. Seitdem hat sich der Erreger über die ganze Welt verbreitet, in Europa verdoppelt sich die Zahl der Todesfälle alle zwei Wochen. Am Dienstag starb in Deutschland zum ersten Mal ein Mädchen an der Schweinegrippe, das keinerlei Vorerkrankungen aufwies. Impfungen sollen die Verbreitung des Virus eindämmen. Doch auch die Herstellung des Impfstoffs verläuft nicht pannenfrei: In Kanada musste der Pharmakonzern GlaxoSmithKline eine Fuhre Impfstoff zurückrufen, weil er bei ungewöhnlich vielen Patienten allergische Reaktionen auslöste.

Swine influenza laboratory could be an accident

Financial Times, Deutschland, 24 Novembre 2009, 18:55

The swine flu virus may have originated because it was sloppy work in a lab - at least an Australian researcher says. The WHO, however, comes from a natural origin.

The theory of the retired Australian virologist Adrian Gibbs of the origin of the swine flu sounds like a scenario from a disaster film: As some scientists tinkering in the lab on a vaccine against different influenza viruses that infect pigs. Work, perhaps not quite clean. Or to infect cell lines for cultivation of virus with multiple strains. Combine snippets of DNA from three different strains are infected to a new virus that humans can. A laboratory employee has the flu pathogen outside - and begins a worldwide pandemic.

The fact is: The origin of the swine flu virus is still unknown. Components of its genome have similarities with eight different influenza viruses that were discovered from 1983 to 2004 in humans, birds and pigs. Gibbs is in his investigations to the conclusion that the new H1N1 pathogen probably goes back to three strains of the virus, which attacked in the past Pigs in the United States and Eurasia. Viruses are propagated in cell cultures

Scientists assume that the original strains of the virus by migratory birds, or trade in pigs came from one continent to another. In an animal that was infected by different pathogens, and finally emerged, the new virus. Gibbs, however, considers the coincidence of the origin of strains in a laboratory to be more probable: "It would be by far the simplest explanation."

Back in May this year, he submitted to the World Health Organization (WHO) in his theory. Now, he published his hypothesis, together with two colleagues in the online journal Virology Journal. The research team wrote: "It is important that the origin of the virus is detected, if we want to prevent future pandemics, instead of fighting after they occur, only the consequences."

Massentierhaltung favors flu in pigs

In the professional world Gibbs hypothesis is viewed with skepticism. Already, the WHO came to evaluating his arguments to the conclusion that the virus originated in a natural way. And Thomas Vahlenkamp, director of the Institute of Molecular Biology at the Friedrich Loeffler Institute, said, "we can completely rule out the emergence of the virus in the laboratory. But I think it is highly unlikely to impossible. "

Healthier in freedom: factory farming weakens pigs

It could very well be a precursor of the virus have developed in a pig population and there for a long time had remained undetected. From animals in South America and Southeast Asia, for example, never viruses were isolated. Scientists estimate that is extremely suitable for intensive farming, the emergence of new virus strains. The pigs are crowded together in a confined space and not just stick it easier. Her immune system is weakened by the poor living conditions.

The first person became infected in April in Mexico with the new flu virus. Since then, the pathogen spreads throughout the world, in Europe doubled the number of deaths every two weeks. On Tuesday died in Germany for the first time a girl in the swine flu, which exhibited no pre-existing conditions. Vaccinations should have contained the spread of the virus. But the production of the vaccine does not run like fail: In Canada, the pharmaceutical company had to recall a load of GlaxoSmithKline vaccine because it triggered unusually large number of patients with allergic reactions.

FriFagbevegelse

Vil lage dødsvirus
Oslo (ANB): Svineinfluensa og fugleinfluensa.
Til sammen kan det bli en uhyggelig cocktail.

Fri Fagbevegelse, 26 November 2009, 07:16
https://web.archive.org/web/20091128181606/http://www.siste.no/Innenriks/helse/article4726428.ece

På et av de sikreste laboratoriene i verden ønsker forskerne å blande et av de mest smittsomme virusene som finnes med et av de dødeligste. Målet er å finne ut om svineinfluensaen og fugleinfluensaen kan bli til en farlig blanding.

Svineinfluensaen (H1N1) smitter lett, men tar bare livet av en brøkdel av dem som blir smittet. Fugleinfluensaen (H5N1) tar livet av mer enn 60 prosent av sine menneskelige ofre, men smitter sjelden fra person til person. Skulle disse to blande seg eller mutere, kan en ny type skrekkvirus se dagens lys: Et virus med dødeligheten til fugleinfluensaviruset og smittsomheten til svineinfluensaviruset, skriver Dagsavisen.

Ved Inserm-laboratoriets biosikkerhetsnivå 4 i Lyon i Frankrike er dødelige virus, som ebola, marburg og hendra låst inne i safer. Laboratoriet ligger i en bygning som skal tåle både jordskjelv og eksplosjoner. Forskerne beveger seg rundt i beskyttelsesutstyr som minner om romdrakter med egen surstofftilførsel. Inserm er det nasjonale franske instituttet for folkehelse og medisinsk forskning.

Angela Kamper

Swine flu epidemic escaped from lab, Australian scientists say

News.Com.Au, 28 November 2009.
https://web.archive.org/web/20091201031808/http://www.news.com.au/swine-flu-epidemic-escaped-from-lab-australian-scientists-say/story-e6freuy9-1225804753259

Three Australian experts are making waves in the medical community with a report suggesting swine flu may have developed because of a lab error in making vaccines.

"It could have happened in a lab where somebody became affected and then travelled with it," virologist Dr Adrian Gibbs said yesterday.

Conjuring up a vision of Frankenstein's fictional monster fleeing the laboratory, he added: "Things do get out of labs and this has to be explored. There needs to be more research done in this area.

"At the moment there is no way of distinguishing where swine flu has come from."

The research, published in the Virology Journal on Tuesday, was compiled by two former researchers at the Australian National University – Dr Gibbs and programmer John S. Armstrong.

Dr Jean Downie, once the head of HIV research at Westmead Hospital, was also involved.

The article claimed the swine-origin influenza A (H1N1) virus that appeared in Mexico in April has at least three parent genes which originated in the US, Europe and Asia.

"The three parents of the virus may have been assembled in one place by natural means, such as by migrating birds, however the consistent link with pig viruses suggests that human activity was involved," the research found.

Within two days of them publishing their findings there were more than 16,000 downloads of the article.

"What we wanted to do was instigate debate about this again because we still don't know the source of this virus," Dr Gibbs said.

The research suggested more tests be done on laboratories "which share and propagate a range of swine influenza viruses".

It said that if the virus was generated by laboratory activity it would explain why it had "escaped surveillance for over a decade".

Dr Gibbs said it was not the first time lab errors had been made, with evidence foot and mouth disease in England had been born out of a lab mistake and circumstantial evidence that Spanish influenza in 1918 and Asian influenza in 1957 reappeared decades later because of mistakes.

"Measures to restore confidence include establishing an international framework co-ordinating surveillance, research and commercial work with this virus and a registry of all influenza isolates held for research and vaccine production," the report concluded.

Lab error theory over swine flu

Herald Sun, 28 November 2009, 12:00 AM
https://www.heraldsun.com.au/news/lab-error-theory-over-swine-flu/news-story/f4e52f4993e0527e833e18625d983376

Three Australian experts have suggested swine flu may have developed as a result of a laboratory error in making vaccines.

"It could have happened in a lab where somebody became infected and then travelled with it," virologist Dr Adrian Gibbs said.

"Things do get out of labs, and this has to be explored. There needs to be more research done in this area.

"At the moment there is no way of distinguishing where swine flu has come from."

A report published in the Virology Journal on Tuesday suggested that the swine-origin influenza A (H1N1) virus that appeared in Mexico in April had at least three parent genes, which originated in North America, Europe, and Asia.

"The three parents of the virus may have been assembled in one place by natural means, such as by migrating birds; however, the consistent link with pig viruses suggests that human activity was involved," it said.

The report was compiled by Dr Gibbs and John S. Armstrong, former researchers at the Australian National University. Dr Jean Downie, the former head of HIV research at the Institute of Clinical Pathology and Medical Research at Sydney's Westmead Hospital, was also involved.

"What we wanted to do was instigate debate about this again, because we still don't know the source of this virus," Dr Gibbs said.

The research suggested more tests be done on laboratories "which share and propagate a range of swine influenza viruses".

It said that if the virus was generated by laboratory activity, it would explain why it had "escaped surveillance for over a decade and how viruses last sampled in North America, Europe and Asia became assembled in one place and generated a reassortant".

Dr Gibbs said there was evidence foot and mouth disease had been born out of a laboratory mistake, and circumstantial evidence that the Spanish flu of 1918 and the Asian flu of 1957 re-appeared decades later because of lab mistakes with vaccines.

"Measures that might restore confidence include establishing both a unified international administrative framework co-ordinating all surveillance, research and commercial work with this virus, and also a detailed registry of all influenza isolates held for research and vaccine production," the report said.

THE FLU CASE

WHO-linked Scientists mixing Swine and Bird Flu to create deadly virus

The Flu Case, 28 November 2009, 11:00

https://web.archive.org/web/20100102051221/http://theflucase.com/index.php?option=com_content&view=article&id=2104%3Awho-scientists-mixing-swine-and-bird-flu-to-create-deadly-virus-in-france&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Swine flu and bird flu viruses are being mixed together by French professor, Bruno Lina, affiliated with WHO, potentially creating a lethal virus writes Ester Nordland on the internet news site Norway Health.

Lina and his team are carrying out this research into creating a lethal bioweapon under the pretext of having to predict the course of a future pandemic.
http://www.siste.no/Innenriks/helse/article4726428.ece

In one of the safest laboratories in the world, scientists are intent on mixing one of the most contagious viruses in this world with one of the most deadly ones, she writes.

The goal is to find out whether swine flu and bird flu can end up as a deadly mixture, writes the Norwegian news agency ANB.

Swine flu (H1N1) is very contagious, but ends up only killing a minority of the persons who actually get the flu.
Bird flu (H5N1), on the other hand, kills more than 60 percent of its human victims, but only in rare cases spreads from person to person.

Should those two viruses mix or mutate, a new horror virus might appear: A virus as devastating as the avian flu virus and as contagious as the swine flu virus.

At the Inserm laboratories biosecurity level 4 in Lyon in France deadly viruses like Ebola, Marburg and Hendra are locked in a safe. The laboratory is situated in a building that may withstand both earthquakes and explosions.

The researchers move around in protection equipment reminiscent of space suits withan inbuilt supply of oxygen.

Inserm is the national French institute for human health and medical research.

Now a team of researchers in Lyon intend to investigate whether the H1N1-virus will interfere with its more deadly relative H5N1 and become a virus with the most dreadful traits of both of them. If they discover what kind of mutations will occur, and what kind of influenza may appear, it might turn out to be a key to predict, how future pandemics will evolve.

Until now they have investigated, how H1N1 can develop resistancy towards the pharmaceutical product Tamiflu.

Now the primal investigator of the research team, Bruno Lina, hopes to be allowed to mix the two viruses. – It is a controversial study, but it is fundamental research which should be carried out, says Lina to the magazine Nature. – If you discover, what parts of the H5H1-virus is most prune to change, you are able to be more alert, if the virus change in those parts, says Lina.

Olav Hungnes coordinates the flu watch at Human Health Institute (Folkehelseinstituttet) in Norway. He says that it is a possibility, that the swine flu virus may change.

Hungnes explains that the genetic profile of the virus may chance in such a way, that it takes up genes from another virus.

The prerequisite of swine flu virus and avian virus mixing to a new and even more more dangerous virus is that they come together. But there are so few cases of avian flu among people, that the chances are low, says Hungnes.

Avian flu is most widespread in Southern Asia.

It is imagined that the pig may serve as a mixing pool for the two types of influenza. In those areas pigs, geese and human beings live together. But until now this has not happened, says senior medical doctor Bjørn Iversen, from Human Health Institute in Norway - Whether it will happen, nobody knows. What you belive in these questions, depends on whether you are an optimist or a pessimist. The optimist will say, that since it has not happened until now, it will never happen. The pessimist will say, that now it has tried so hard for such a long time, that it is just before it succeed. I believe that the possibility that it will actually happen is small. The avian flu virus has circulated since 1987. It came back in 2003, and in spite of the fact, that there has been a lot of normal seasonal influenza, it has not succeded in mixing with this, says Iversen.

According to Bjørn Iversen research in this area is taking place all over the world.

In an American laboratory, the researcher Jeffrey Taubenberger has managed to reconstruct the Spanish flu virus which laid the world waste at the beginning of the 20. century (1900-tallet). His team of researchers have cultivated a new live virus. (ANB)

Reassortment between avian H5N1 and human H3N2 influenza viruses creates hybrid viruses with substantial virulence

Proc Natl Acad Sci U S A. 22 February 2010 // 9 March 2010, 107(10):4687-92
doi: 10.1073/pnas.0912807107

Abstract

The spread of avian H5N1 influenza viruses around the globe has become a worldwide public health concern. To evaluate the pathogenic potential of reassortant viruses between currently cocirculating avian H5N1 and human H3N2 influenza viruses, we generated all the 254 combinations of reassortant viruses between A/chicken/South Kalimantan/UT6028/06 (SK06, H5N1) and A/Tokyo/Ut-Sk-1/07 (Tok07, H3N2) influenza viruses by reverse genetics.

We found that the presence of Tok07 PB2 protein in the ribonucleoprotein (RNP) complex allowed efficient viral RNA transcription in a minigenome assay and that RNP activity played an essential role in the viability and replicative ability of the reassortant viruses.

When the pathogenicity of 75 reassortant H5 viruses was tested in mice, 22 were more pathogenic than the parental SK06 virus, and three were extremely virulent. Strikingly, all 22 of these viruses obtained their PB2 segment from Tok07 virus.

Further analysis showed that Tok07 PB1 alone lacked the ability to enhance the pathogenicity of the reassortant viruses but could do so by cooperating with Tok07 PB2.

Our data demonstrate that reassortment between an avian H5N1 virus with low pathogenicity in mice and a human virus could result in highly pathogenic viruses and that the human virus PB2 segment functions in the background of an avian H5N1 virus, enhancing its virulence.

Our findings highlight the importance of surveillance programs to monitor the emergence of human H5 reassortant viruses, especially those containing a PB2 segment of human origin.

Scientists bioengineer a lethal bird flu and seasonal flu mutation

The Flu Case, 24 February 2010, 12:02
https://web.archive.org/web/20100301040215/http://www.theflucase.com/index.php?option=com_content&view=article&id=2813%3Ascientists-bioengineer-a-lethal-bird-flu-and-seasonal-flu-mutation&catid=1%3Alatest-news&Itemid=64&lang=en

Scientists have used reverse genetics to make 254 possible new viruses after mixing H5N1 bird flu and the H3N2 seasonal flu virus, and found that three of these were "extremely virulent", according to a recent study published in the Proceeding of National Academy of Sciences.

Studies showing that the bird flu can be genetically mixed with seasonal H3N2 flu to create a deadly combination were published as early as 2008. While the bird flu is very deadly, killing around 60% of the humans it infects, it does not spread easily between people. The H3N2 virus, on the other hand, can easily spread but usually not deadly.

It was this lethal combination of bird flu and H3N2 seasonal flu viruses that Baxter created in its biomedical facilities in Austria in February 2009 when it contaminated 72 kilos of the seasonal flu with the live bird flu virus, so nearly sparking a global bird flu pandemic. Given that Baxter has to follow biosafety level 3 regulations, an accidental contamination can be virtually ruled out.

A pandemic emergency level 6 declaration by WHO triggers contracts that Baxter and other pharmaceutical companies have with governments to supply billions of dollars of inadequately tested and potentially harmful vaccines. Furthermore, under a pandemic emergency level 6, police can force people to take the vaccination or go into quarantine.

The finding of the latest study appear to be being used to hype the threat of the emergence of a lethal swine flu and bird flu hybrid even though the study did not focus on the swine flu virus.

"Our findings highlight the importance of surveillance programs to monitor the emergence of human H5 reassortant viruses," said one of the scientists. => http://www.pnas.org/content/early/2010/02/18/0912807107

BusinessWeek

Deadly Hybrid Flu Possible
Stronger strain could develop if avian, seasonal viruses combine, scientists warnBusinessweek

Business Week, 22 February 2020
https://web.archive.org/web/20100329194832/http://www.businessweek.com/lifestyle/content/healthday/636221.html

MONDAY, Feb. 22 (HealthDay News) -- Research in mice suggests the avian flu virus and the ordinary seasonal flu virus could combine to create a new deadly kind of flu, researchers say.

A single bit of genetic material from the seasonal virus converted the avian flu – officially known as H5N1 – into a very dangerous form, the scientists report in a study published in the Feb. 22-26 online edition of the *Proceedings of the National Academy of Sciences*.

"Some hybrids between H5N1 virus and seasonal influenza viruses were more pathogenic than the original H5N1 viruses. That is worrisome," study senior author Yoshihiro Kawaoka, a virologist at the University of Wisconsin-Madison, said in a news release.

Avian flu, also known as bird flu, has killed 262 people, according to the World Health Organization, but it hasn't become very infectious between people.

The researchers warn that swine flu -- H1N1 -- could also play a role in viral combinations.

"With the new pandemic H1N1 virus, people sort of forgot about H5N1 avian influenza. But the reality is that H5N1 avian virus is still out there," Kawaoka said. "Our data suggests that it is possible there may be reassortment between H5N1 and pandemic H1N1 that can create a more pathogenic H5N1 virus."

THE FLU CASE

Viruses to be used in seasonal flu jab not identical to mild swine flu strain

The Flu Case, 23 February 2010, 16:25
https://web.archive.org/web/20100301040140/http://www.theflucase.com/index.php?option=com_content&view=article&id=2806%3Aviruses-to-be-used-in-seasonal-flu-jab-not-identical-to-mild-swine-flu-strain&catid=1%3Alatest-news&Itemid=64&lang=en

WHO has recommended the inclusion of viruses that are like the swine flu viruses – but not the same -- for the upcoming seasonal flu vaccine programme, according to their documents.

It is not clear in what respect these swine flu viruses differ from the predominant mild strain or whether they are bioengineered.

Ex-Pfizer Worker Cites Genetically Engineered Virus in Lawsuit over Firing

The Hartford Courant, 14 March 2010, 5:00 a.m.
https://www.courant.com/2010/03/14/ex-pfizer-worker-cites-genetically-engineered-virus-in-lawsuit-over-firing/

Medical experts will be watching closely Monday when a scientist who says she has been intermittently paralyzed by a virus designed at the Pfizer laboratory where she worked in Groton opens a much anticipated trial that could raise questions about safety practices in the dynamic field of genetic engineering.

Organizations involved in workplace safety and responsible genetic research already have seized on the federal lawsuit by molecular biologist Becky McClain as an example of what they claim is evidence that risks caused by cutting-edge genetic manipulation have outstripped more slowly evolving government regulation of laboratories.

McClain, of Deep River, suspects she was inadvertently exposed, through work by a former Pfizer colleague in 2002 or 2003, to an engineered form of the lentivirus, a virus similar to the one that can lead to acquired immune deficiency syndrome, or AIDS. Medical experts working for McClain believe the virus has affected the way her body channels potassium, leading to a condition that causes complete paralysis as many as 12 times a month.

"If a worker in a plant as sophisticated as Pfizer is becoming infected with a genetically engineered virus, then I think the potential is everywhere," said Jeremy Gruber, president of the Council for Responsible Genetics, a public interest group created to explore the implications of genetic technologies.

"Genetically engineered viruses are commonly worked on at your average university," Gruber said. "The public has a right to know what regulations are in place and what regulations are required to fix an industrywide issue. We need to have a conversation about this. Ms. McClain's attempt to do that has been hampered at every turn, by the courts and by regulators."

Pfizer disputes all of McClain's claims and says it fired her in 2005 because she refused to come to work. The global pharmaceuticals manufacturer, with research labs in southeastern Connecticut, defends its safety practices and denies that McClain's physical disability is related to exposure at its Groton lab. The company says she did not link her disability to workplace exposure until after she was fired.

As a molecular biologist, McClain studied cells on a molecular level, manipulating genetic codes in an effort to develop vaccines. During the period at issue in the suit, McClain worked in Pfizer's Human Health Embryonic Stem Cells Technologies, Genomic and Proteomic Sciences and Exploratory Medicinal Sciences Group.

Hostile Exchanges

The sharp disagreement between McClain and her former employer mirrors a half-dozen or so years of hostile litigation leading to Monday's jury trial in Hartford before U.S. District Judge Vanessa L. Bryant. McClain will argue that she was wrongfully dismissed and is entitled to unspecified damages. In the run-up, Pfizer attacked McClain's legal claims, and she questioned the company's corporate integrity.

On the advice of her lawyers, McClain would not discuss her suit last week. Neither would her lawyers, nor those representing Pfizer.

But McClain has claimed in her suit and in earlier public statements that she was fired after experiencing symptoms of illness and after complaining to the U.S. Occupational Safety and Health Administration about safety in her Pfizer lab.

OSHA dismissed McClain's complaint. In a decision published after McClain's termination, the agency criticized her for refusing to return to work in spite of "Pfizer's substantial efforts" to address her concerns. In a speech last year to a labor safety group in California, McClain said she was told by an OSHA investigator that the federal agency's legal authority has not kept pace with developments in sophisticated medical research.

A series of angry, pretrial exchanges developed over McClain's efforts to compel Pfizer to give her precise information about the DNA sequencing of the engineered lentivirus she suspects infected her. Pfizer says it responded to all of McClain's requests, in accordance with the law. Her advocates called Pfizer's assertion preposterous and claimed the company has not produced – perhaps because it is subject to trademark – the sequencing data that could enable scientists to engineer a genetic cure.

Over the course of pretrial argument, the number and breadth of McClain's legal claims against Pfizer have been reduced from eight to two. Last month, Bryant dismissed the most significant of the eight claims: that willful and wanton misconduct by Pfizer resulted in lax laboratory procedures. McClain claimed laxity contributed to her exposure.

McClain's advocates point to language in Bryant's ruling that suggests the misconduct allegation was dismissed, at least in part, because state law requires such claims to be resolved by state workers' compensation rules. But Pfizer says Bryant's ruling is another vindication of its assertion that no evidence exists to support McClain's contention that she was infected by a viral exposure at Pfizer.

"We have thoroughly investigated Ms. McClain's claims and our investigation concluded that her workplace was safe and that she was not infected by any virologic materials while she was employed by Pfizer," company spokeswoman Elizabeth Power said.

Bryant's ruling means the trial will move forward under McClain's two remaining claims, both of which involve free speech protection. She says Pfizer fired her in violation of Connecticut's whistle-blower law after she raised questions about Pfizer lab safety to OSHA. And she claims her dismissal also was in retaliation for questions she raised in discussion with Pfizer colleagues about safety practices. In addition to performing her research duties, McClain served on a lab safety committee for at least part of the nine years she was employed by Pfizer.

Medical Evidence

Pfizer has taken the position that Bryant's ruling in March means no evidence will be admitted at the trial concerning McClain's health or her claim that it was destroyed by bad lab procedures. McClain's advocates, again, disagree. Because McClain is suing under a whistle-blower claim, they believe she will be allowed to present evidence about why she figuratively blew the whistle. If her health and safety are the reasons, they say, the judge could allow jurors to hear evidence in those areas.

In her suit, McClain says that Pfizer hired her in 1995 and that, in 2000, she became involved in human cellular research associated with vaccine development. She later learned, the suit says, that colleagues in her lab were working with infectious, genetically engineered viruses, including the lentivirus she suspects causes what her physician calls "acute intermittent paralysis."

The suit describes lab events that McClain suggests could have infected her.

The first involved the possible malfunction of a "laminar hood," a system designed to contain materials being subjected to scientific manipulation and to purify the air circulating around the

materials. She said the hood began emitting a noxious odor at the same time she and several colleagues developed symptoms of illness, including nausea.

McClain said in the suit that, as a member of the lab safety committee, she reported the apparent hood malfunction. Judge Bryant said in a preliminary ruling that Pfizer took "various steps" to fix the hood and ultimately replaced it, twice.

Pfizer contends that the hood problem was resolved eight months after McClain reported it. But a long e-mail message by one of McClain's supervisors and the OSHA review corroborate McClain's contention that the problem persisted for a year. Before it was corrected, several people suffered from headaches, vomiting and nausea, including at least one member of the crew that cleaned the lab after work.

About two months after the hood problem was resolved, McClain says in the suit, she learned from a colleague that he was working "next to" her on "dangerous lentivirus material and embryonic stem cells." The work was being done on an open lab bench, unprotected by a biological containment system, the suit says, even though lentivirus work should have been done only under a protective "biological hood."

"I was shocked and appalled to find he had been using lentivirus materials on an open lab bench without biocontainment where I performed my office work (e.g. without gloves) in October 2003," McClain wrote in a legal filing.

On another occasion, she says, she encountered an unidentified experimental set-up consisting of cell cultures on her laboratory bench, but she cannot recall whether she touched it.

Pfizer has responded that any lentivirus studied in lab areas where McClain was present was not derived from a human infectious virus and was not infectious because it lacked genes for replication.

McClain says in the suit that she repeatedly raised laboratory safety issues following the hood malfunction, despite a warning from a supervisor that doing so could jeopardize her employment. She said she began suffering from "fatigue, suspicion of multiple sclerosis, joint pain, and numbness in her face as well as sleep difficulties" and took a medical leave in February 2004. She was fired about 11 months later.

The suit contends the dismissal was retaliation for her complaints about safety. In a speech a year ago, McClain asserted that some of the safety deficiencies she has criticized are the product of poor lab design – design that is nonetheless acceptable under OSHA rules.

Pfizer contends that McClain's dismissal was not related to her concern about safety. Rather, the company says, she was terminated for refusing to report back to work after the company made her repeated offers, including alternative employment opportunities, some in laboratories other than the one about which she had complained. Pfizer claims McClain was told in advance of her termination that she would be fired if she didn't return to work.

Even though jurors are unlikely to hear arguments that McClain's potassium disorder and related transient paralysis are attributable to exposure to an engineered virus, a network of laboratory safety advocates already is using the case as a rallying point. A group from San Francisco has planned a press conference outside the Hartford courthouse on Main Street at 12:15 p.m. Monday.

They say OSHA's inability to stay abreast of developments in sophisticated, molecular research techniques – as well as law protecting the confidentiality of proprietary discoveries – has neutralized the agency's ability to act as an effective regulator.

"This case shows a major flaw for workers in the biotech industry who have to prove where they got injured in order to receive workers' compensation," said Steve Zeltzer, one of the organizers.

A Lyon on essaie de croiser les virus H1N1 et H5N1de la grippe

Le Progres, 18 March 2010, 04h00
https://web.archive.org/web/20100501090431/http://www.leprogres.fr/fr/france-monde/article/2859863,192/A-Lyon-on-essaie-de-croiser-les-virus-H1N1-et-H5N1de-la-grippe.html

Au sein du P4, un laboratoire de sécurité maximale, une expérience en cours s'efforce de déterminer les conditions d'hybridation des deux virus. Le premier se propage vite mais tue peu, le second est peu contagieux mais souvent mortel

Depuis trois semaines, le P4 de Lyon a interrompu toutes ses autres manipulations. Ce laboratoire de sécurité maximale – il n'en existe qu'un en France et une vingtaine dans le monde – se concentre actuellement sur une expérience à haut risque : des tentatives de croisement entre le nouveau virus H1N1 et celui de la grippe aviaire, le H5N1. Le premier se propage beaucoup et tue peu, le second se propage peu et tue beaucoup. Une hybridation des deux serait calamiteuse.

«On essaie de comprendre, en infectant une cellule avec ces deux virus, quels sont les déterminants génétiques qui leur permettraient d'échanger leurs gènes (notamment chez le cochon NDLR)» résume le virologue Bruno Lina, qui dirige les travaux sur la grippe A pour ce laboratoire Inserm. Trois biologistes de son équipe ont été détachés pour effectuer ces tests décidés et avalisés au niveau ministériel. Pourvus de passeports spécifiques, ils sont assistés par une demi-douzaine de techniciens attachés au site. «Toutes les manipulations se font en scaphandre et obéissent à des règlements très contraignants» assure Bruno Lina.

Si l'expérience est bien liée au Centre national de référence des virus de la grippe, que ce dernier dirige, sa finalité ne serait, selon lui, pas d'aboutir à un vaccin, mais juste «cognitive»: «Pourquoi fabriquer un vaccin contre un virus qui n'existe pas?» Ou pas encore. Les premiers résultats ne tomberont avant deux mois et décideront de la suite à donner à cette opération au budget (provisoire) de 200 000 euros. Pour l'heure, «on a fait quelques essais, mais on n'a obtenu que des résultats très préliminaires» poursuit le virologue. S'il est trop tôt pour en déduire quoi que ce soit quant à la probabilité de l'apparition d'un tel monstre viral, «aujourd'hui, le risque semble faible» confie-t-il. Et de conclure: «C'est une bonne nouvelle».

Si les médias semblent pour l'instant en avoir fini avec la grippe A, ce n'est sans doute pas le cas de nos organismes. «C'est une certitude, il y aura bien une nouvelle vague épidémique» estime Bruno Lina, directeur du Centre national de référence des virus de la grippe.

«Soit le virus H1N1 se transforme en virus saisonnier et cette épidémie aura alors un impact modéré, soit il déclenche une deuxième vague l'hiver prochain» poursuit-il.

Deuxième vague qui pourrait avoir un impact plus important, comme cela avait été le cas lors des épidémies grippales des hivers de 1957 (H2N2) et 1968 (H3N2): «C'est lors des deuxièmes vagues, en hiver 58 et en hiver 69, qu'il y avait eu le plus de décès» rappelle le virologue. Même « si rien n'est logique avec cette grippe, il faut quand même garder ça en tête».

Sans être alarmiste, le chercheur garde aussi un œil sur le virus aviaire H5N1 (287 décès sur 486 cas dans le monde) qui, constate-t-il, «semble un peu reprendre du poil de la bête». Comme en témoignent les cinq nouveaux cas répertoriés en Egypte.

O.S. - Les filovirus Ebola et Marburg - Les arénavirus de type 4 : le virus Lassa d'origine africaine et les arénavirus d'origine sud américaine. - Le virus de la fièvre hémorragique de Congo Crimée - Le virus de la variole - Les Henipavirus Nipah et Hendra - Les virus Influenza A H5N1 d'origine.

1918 and 2009 Pandemic Influenza Viruses Lack a Sugar Topping

NIH, 24 March 2010
https://www.nih.gov/news-events/news-releases/1918-2009-pandemic-influenza-viruses-lack-sugar-topping

Finding Could Aid Vaccine Design

Although they emerged more than 90 years apart, the influenza viruses responsible for the pandemics of 1918 and 2009 share a structural detail that makes both susceptible to neutralization by the same antibodies. Scientists led by Gary J. Nabel, M.D., Ph.D., of the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health, describe the molecular basis for this shared vulnerability and suggest how it might be exploited to design vaccines matched to future pandemic influenza virus strains. The research appears online today in the journal Science Translational Medicine.

"This study defines an unexpected similarity between two pandemic-causing strains of influenza," says NIAID Director Anthony S. Fauci, M.D. "It gives us a new understanding of how pandemic viruses evolve into seasonal strains, and, importantly, provides direction for developing vaccines to slow or prevent that transformation."

In one set of experiments, the NIAID scientists and their colleagues including Terrence M. Tumpey, Ph.D., of the Centers for Disease Control and Prevention, injected mice with a vaccine made from inactivated 1918 influenza virus. Then they exposed the mice to high levels of 2009 H1N1 virus. All of the vaccinated mice survived. The reverse was also true: Mice vaccinated with inactivated 2009 H1N1 virus and then exposed to 1918 virus were protected from death. The researchers concluded that vaccination with either pandemic virus caused the mice to produce antibodies capable of neutralizing the other virus.

"This is a surprising result," notes Dr. Nabel. "We wouldn't have expected that cross-reactive antibodies would be generated against viruses separated by so many years."

Ordinarily, he explains, antibodies made in response to one year's seasonal flu strain do not fully react with, or cross-neutralize, seasonal flu strains that come along just a few years later. This is due in part to slight, yearly changes in the amino acid sequence of hemagglutinin (HA), a viral surface protein. The amino acid sequences of the 1918 and 2009 H1N1 influenza viruses in a portion of HA called the globular head differ by about 20 percent. That difference is on a par with amino acid divergence in the HA head region among seasonal strains, so the researchers reasoned that antibody cross-neutralization in the pandemic viruses must be due to some feature besides simply the degree of amino acid variation.

In a series of experiments and computer modeling studies, Dr. Nabel and his team determined that both pandemic viruses lack a cap of sugar (glycan) molecules at two specific spots on the top of HA's globular head. Without these sugars, both the 1918 and 2009 pandemic viruses have unfettered access to the receptors that HA uses to enter human cells. This viral advantage quickly diminishes as immunity provided by neutralizing antibodies arises in people who have been infected (and recovered) or when people are vaccinated.

In contrast to the 1918 and 2009 viruses, when the investigators analyzed the structure of seasonal flu strains that had circulated between 1977 and 2008, they found that 97.8 percent had one glycan molecule covering the HA's head, while 87.8 percent of the strains had two glycans. "The glycans act like an umbrella that shields the virus from the immune system," says Dr. Nabel. "They create a physical barrier over the virus and prevent antibody neutralization."

Further analysis of influenza sequences collected prior to 1977 revealed that the HA protein in the descendants of the 1918 influenza virus acquired glycans by the early 1940's. "Our study points to the key role played by glycans in protecting hemagglutinin from neutralization as pandemic viruses evolve into seasonal ones," says Dr. Nabel.

Next, the researchers engineered mutant pandemic flu viruses by placing sugar molecules on the two critical regions at the top of the globular head. Once covered, antibodies could no longer recognize and neutralize the virus. However, says Dr. Nabel, the sugar-capped viruses did perform well as vaccines.

In their last series of experiments, the investigators added sugar molecules to a 1918 influenza virus and vaccinated mice with it. The mice produced antibodies able to neutralize the original, sugar-free version of the 1918 virus. "We can use this knowledge to preemptively design vaccines with glycosylated versions of the newly emerged 2009 H1N1 pandemic influenza virus," says Dr. Nabel. Such a vaccine, he adds, would protect against the pandemic virus and might also limit the virus's chances of acquiring a sugar shield that would allow it to entrench itself as a seasonal variant.

Swine Flu Virus Not So New, Study Finds

NBC News, 25 March 2010, 10:32 PM GMT+8
https://www.nbcnews.com/id/wbna36032362

Washington (Reuters) - *The H1N1 swine flu virus may have been new to humanity in many ways but in one key feature its closest relative was the 1918 pandemic virus, researchers reported on Wednesday.*

Their findings could point to better ways to design vaccines and help explain why the swine flu pandemic largely spared the elderly.

"This study defines an unexpected similarity between two pandemic-causing strains of influenza," Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, said in a statement.

Two studies show an important structure called hemagglutinin is very similar in both the swine flu H1N1 and its distant cousin, the H1N1 virus that caused the 1918 pandemic. Hemagglutinin is used by viruses to infect cells and gives influenza viruses the "H" in their designations.

For one study, published in Science Translational Medicine, Chih-Jen Wei, Gary Nabel and colleagues at NIAID injected mice with a vaccine made using the 1918 influenza virus -- which killed an estimated 40 million to 100 million people.

When they infected the mice with H1N1 swine flu, the vaccinated mice survived, while many unprotected mice died.

The reverse also worked -- when they immunized mice using the 2009 H1N1 virus, and then infected them with the 1918 strain, the mice were protected.

"This is a surprising result," Nabel said. "We wouldn't have expected that cross-reactive antibodies would be generated against viruses separated by so many years."

The team also showed that as flu viruses circulate, they develop a kind of shield called a glycan that protects them from the body's immune system. That may allow them to become regular, seasonal visitors.

"It gives us a new understanding of how pandemic viruses evolve into seasonal strains, and, importantly, provides direction for developing vaccines to slow or prevent that transformation," Fauci said.

ABSTRACT

Background: On December 31, 2019, the World Health Organization's China Country Office was alerted to cases of pneumonia of unknown cause detected in Wuhan City, Hubei Province of China.

Methods: Due to the fact that to date, the question of the origin of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has not been resolved yet, the author analyzed the main advances in the development of genetic engineering of viruses that took place before the onset of the COVID-19 pandemic.

Results: The first artificial genetically modified viruses could appear in nature in the mid-1950s. The technique of nucleic acid hybridization was developed by the end-1960s. In the late 1970s, a method called the "reverse genetics" emerged to synthesize ribonucleic acid and deoxyribonucleic acid molecules. In the early 1980-s, it became possible to combine the genes of different viruses and insert the genes of one virus into the genome of another virus. Since that time, the production of vector vaccines began. At present, by modern technologies one can assemble any virus based on the nucleotide sequence available in the virus database or designed by a computer as a virtual model.

Conclusion: Scientists around the world are invited to answer the call of Neil Harrison and Jeffrey Sachs of Columbia University, for a thorough and independent investigation into the origin of SARS-CoV-2. Only a full understanding of the origin of the new virus can minimize the likelihood of a similar pandemic in the future.

INTRODUCTION

On December 31, 2019, the World Health Organization's China Country Office was alerted to cases of pneumonia of unknown cause detected in Wuhan City, Hubei Province of China.[41] On January 21, 2020, Sather tweeted that the coronavirus that caused the epidemic in China was patented back in 2018.[49] Presumably he meant a patent describing an attenuated version of the coronavirus, which can be used as a vaccine for the treatment and prevention of coronavirus infection.[1] Sather also recalled that in early 2019, the World Health Organization (WHO) named vaccine hesitancy as one of the top ten threats to global health. As it is known, *Ten threats to global health in 2019* was issued in the middle of January 2019,[60] and immediately caused an active discussion.[4,16,62,63] On September 12, 2019, the WHO organized the Global Vaccine

Summit, which discussed three important topics, namely: "In Vaccines we trust," "The Magic of Science" and "Vaccines Protecting Everyone, Everywhere."[17] At the same time, workshops were held with some media and social networks in regard to the censorship of the content of publications. In particular, it was recommended to limit discussions on the topics related to the effectiveness of natural immunity and natural treatments, as well as the necessity and effectiveness of vaccination and its side effects.[34] Sather then asked questions whether the new disease was planned, whether it will be a way to raise money through the BigPharma system, whether the mass media are used to instill fear around a new disease, etc.[49]

On January 23, 2020, several events took place that played an important role in the subsequent development of the pandemic. On this day, a historic session on the Coronavirus was held at the World Economic Forum in Davos. The keynote speakers were Jeremy Farrar, a director of the Wellcome Trust, Richard Hatchett, a director of the Coalition for Epidemic Preparedness Innovation, and Stefan Bancel, a director of Moderna, Inc., an American pharmaceutical and biotechnology company. It has been suggested that at the heart of the fight against the impending threat should be the restriction of movement and the vaccination of people with a new messenger ribonucleic acid (RNA)vaccine that can be developed and tested in a very short time.[67] On the same day two articles were published regarding the pandemic: In the first article, a panel of experts, with the participation of the director of the US National Institute of Allergy and Infectious Diseases, Fauci *et al.*, expressed the opinion that coronavirus infection is much more dangerous than the common cold,[40] and another article suggested a polymerase chain reaction test to detect a new coronavirus (2019-nCoV) patients.[9] Furthermore, on January 23, 2020, humanity suffered an irreparable loss - the sudden death of Peter Salama, epidemiology expert, former director of the WHO Health Emergencies Program, who organized the successful fight against the Ebola virus in the Democratic Republic of the Congo.[66]

Since that time, some media began to discuss the origin of the new virus, including the assumption of a virus leak from a bio-laboratory or even of a biological warfare.[39]

On January 31, 2020, an article "Unique inserts in the 2019-nCoV spike protein"[42] was published followed by another one "Reduction and functional exhaustion of T-Cells."[13] These discoveries demonstrated structural and functional similarities between two viruses and prompted a common sense question about the origin of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).

On February 5, 2020, the VESTI.RU published a brief overview of the researches dealing with the achievements in genetic engineering of viruses over the past 20 years. Among them were: A mousepox virus constructed in Australia (2001); a poliovirus synthesized in the USA (2002); a "Spanish Flu" virus recovered and modified by the experts from the USA and Japan (2005–2008); an airborne avian influenza virus synthesized in the Netherlands (2011); a recombinant coronavirus, which poses an epidemic danger to humans, created by scientists from the USA, China and Switzerland (2015); a horsepox virus (HPXV) reconstructed by scientists from the USA and Canada (2018), etc.[52]

Confirmation of the possibility to obtain a new virus in the laboratory was the assembling of a synthetic coronavirus in a Swiss laboratory in February 2020. For the synthesis the scientists used a nucleotides sequence in the viral genome published by Chinese authors.[61]

The version of the artificial origin of SARS-CoV-2 was supported by the Nobel laureate in Physiology or Medicine in 2003, Luc Montagnier, who was well acquainted with the achievements of the genetic engineering of viruses. According to Montagnier, the new virus was a side effect of research to develop a vaccine to prevent human immunodeficiency virus (HIV) infection.[44] Presumably, several genes important for the formation of immunity against HIV were inserted into the genome of the coronavirus. It only remained to weaken the virulence of a new virus and the vector vaccine against HIV infection would be ready.

Supporters of the natural origin of the new virus were in the majority. Among them, one can find many experts from all over the world who claimed that nowadays it was impossible to create a virus like SARS-CoV-2 in the laboratory. In March 2020, around 30 scientists published an article in the Lancet, which stated the following: "We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin. Scientists from multiple countries have published and analyzed genomes of the causative agent, SARS-CoV-2, and they overwhelmingly conclude that this coronavirus originated in wildlife."[3]

On April 18, 2020, Yuan Zhiming, a director of the Wuhan Institute of Virology, declared: "From my personal understanding of virology, there is no evidence to prove that the virus has artificial or synthetic traces. Besides, some scientists believe that to synthesize a virus requires extraordinary intelligence and work load. So I have never believed that we humans would have the capability at this time to synthesize such a virus."[10]

A detailed and balanced analysis of the possible origins of the new virus was published in July 2020. In this study, Sousa concluded that "The various genetic peculiarities discovered in SARS-CoV-2 can be explained naturally. However, as the number of abnormalities causing some gain of function increases... the statistical chances of such an event occurring decrease randomly in nature."[57]

Questions about the origins of the virus resurfaced in December 2020 when production of an Australian vaccine was discontinued as healthy vaccinated people became tested positive for HIV.[11]

MATERIALS AND METHODS

Due to the fact that to date, the question of the origin of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has not been resolved yet, the author analyzed the main advances in the development of genetic engineering of viruses that took place before the onset of the COVID-19 pandemic.

The objective of this article is to study the main phases in the development of technologies used in the genetic engineering of viruses from isolation of the first virus in 1935 to the emergence of the COVID-19 pandemic.

RESULTS

The initial phase of research on the modification of the viruses

After the isolation of the tobacco mosaic virus, the study of the structure of viruses, as well as the determination of the role of proteins and nucleic acids in the infectious process began. Regular research into virus breakdown and reconstitution started in the mid-1950s. The book "Viruses" published in 1959 had a section devoted to the chemical basis of the infectivity of viruses. The chapter *Reconstitution of viruses from different strains* includes several topics, namely: *Mixed viruses*; *Mixed nucleic acid viruses*; *Search for in vitro-produced mutants*, etc. On the page 453 one can read the following: "Since it has become possible to demonstrate infectivity in degraded and reconstituted virus preparations, the aim has been to produce at will a new genetic (i.e., replicating) species of molecules."[15]

Viruses were exposed to either chemical or physical agents, which led to a change in their genotype and phenotype. An important aspect of such research was the isolation and study of parts of the viral genome that played a leading role in the process of infection and disease development.[53] Studies on the creation of pathogenic viruses using adaptive influence still continue in present time.[30]

Technologies used for nucleic acid synthesis and modification as well as nucleotide sequencing

The technique of nucleic acid hybridization was developed by the mid-1960s.[54] In the late 1960s, it became possible to insert deoxyribonucleic acid (DNA) fragments of viruses into the DNA molecules of animal cells.[47] Then, a technology was developed to connect the ends of DNA molecules belonging to different viruses and bacteria; circular structures were constructed, consisting of the DNA of the simian virus 40 (SV40), the DNA segment of the lambda phage gene, and the DNA segment of the bacterium *Escherichia coli*.[26] Approximately at the same time, experiments were carried out on the extracellular synthesis of nucleic acid molecules.[28] In 1976, a hybrid virus was constructed in which a segment of the DNA molecule of the lambda phage was inserted in place of the deleted part of the DNA of the SV40 genome.[18]

By 1978, a technique was developed to control the change in the genome of the virus, called the method of "reverse genetics." The ribonucleic acid (RNA) molecule to be replicated was used as a template, on which a DNA molecule was built with the help of the enzyme called reverse transcriptase. Then, the newly created DNA molecule was used as a template for constructing RNA molecules identical to the primary experimental molecule. At this stage of the synthesis, the enzyme DNA dependent RNA polymerase was used.[58]

In 2002, at the State University of New York, a template in the form of a DNA molecule was assembled from synthetic oligonucleotides, and then a full-sized infectious neurovirulent poliovirus was *de novo* synthesized; it was capable of paralyzing and killing mice. The nucleotide sequence of the viral genome was taken from a database available on the Internet, and the necessary synthetic oligonucleotides were purchased through a chemical sales network. This experiment proved the possibility of synthesizing an infectious pathogen by biochemical means *in vitro*, having only a description of the genome and synthetic nucleotides.[5]

In 2003, a report was made on a new technique that allows the rapid assembly of a synthetic DNA molecule with a size of 5–6 Kb. As confirmation of this, the complete infectious genome of bacteriophage X174, consisting of 5386 nucleotides, was assembled, for which chemically synthesized oligonucleotides were used. The infectivity of synthetic DNA was lower than that of a natural DNA, indicating approximately 10 errors per molecule.[55]

The creation of new bacterial and viral genomes was accompanied by the emergence of methods for determining the nucleotide sequence, that is, sequencing of DNA and RNA molecules.[2,33,48]

Construction of reassortant viruses and production of vector vaccines

By the beginning of 1980s, genetic engineering had developed a technology (*gene splicing*), that allows inserting a selected gene of one virus into a desired position in the genome of another virus, and then analyzing the phenotype of a new object. For example, one of the features of the epidemic

rotavirus that causes diarrhea in humans is the difficulty of cultivation in tissue culture. After replacing several growth-limiting genes with cultured bovine rotavirus genes, a reassortant human rotavirus became capable of growing in tissue culture. This study was completed and a manuscript was sent to the editor of the Proceedings of the National Academy of Sciences of the United States of America on September 5, 1980.[19]

In 1982, the results of constructing and studying the characteristics of the new reassortant poxviruses were published. Panicali and Paoletti wrote: "We have constructed recombinant vaccinia viruses containing the thymidine kinase gene from herpes simplex virus. The gene was inserted into the genome of a variant of vaccinia virus that had undergone spontaneous deletion as well as into the 120-megadalton genome of the large prototypic vaccinia variant"[36]

Newly constructed reassortant viruses were now used for the production of a new type of vaccines. For example, Paoletti *et al*. published results of their study: "The technique involves translocating a particular gene from an infectious agent into the genetic material of the smallpox vaccine virus. This unique foreign gene, selected because it contains the information essential for the synthesis of an antigen important in immunity to that particular infectious disease agent, is now expressed under the regulation of the engineered smallpox vaccine virus. On immunization with this live recombinant vaccine, the body is fooled into thinking that it was infected by the foreign infectious disease agent and mounts a defensive attack resulting in immunity to that particular infectious agent."[38] It is further reported that smallpox vaccine viruses were engineered to express genes encoding either the hepatitis B virus surface antigen, or the herpes simplex virus glycoprotein D, or the hemagglutinin from influenza virus. This study was completed and published in September 1984.[38]

Vaccines made with application of a genetically modified non-infectious virus, into the genome of which genes taken from the infectious virus against which the preventive action is directed, were called "vector vaccines."[21]

Thus, any vector vaccine is the result of research on creation and production of a new genetically modified reassortant virus. One can assume that the construction of viruses similar to SARS-CoV-2 became possible around the border of 1980s and 1990s.

The rescue of the Spanish flu virus that caused a pandemic in 1918–1920

In 1995, a team of experts from the Armed Forces Institute of Pathology (a U.S. government institution) began research to isolate the virus that caused the Spanish Flu pandemic. In 2005, scientists concluded that it was an avian non-reassortant virus that had adapted to humans.[59] The Spanish Flu virus was rescued by reverse genetics technique, and after the final manipulations, the deadly virus became human-specific.[64]

During the study of the certain parts of the Spanish Flu virus genome, specific gens were identified that could be responsible for high virulence and mortality. Then the construction of new reassortant viruses as well as testing their virulence began. In particular, recombinant viruses were generated in which the genes of the 1918 virus were replaced by genes from the modern human influenza virus H1N1, as well as recombinant viruses, in which the genes of the modern human influenza virus were replaced by genes of the 1918 virus.[37,65] It was assumed that understanding the virulence factors of future pandemic viruses would help to develop effective antiviral drugs that can prevent or stop a future pandemic.

Continued work on the construction of the new reassortant viruses

Studies with potentially dangerous viruses included modification of genotype and phenotype among flaviviruses, poxviruses, orthomyxoviruses, coronaviruses, and others.

In 1999, scientists created a reassortant flavivirus in which the genes encoding two structural proteins of the Japanese encephalitis virus were inserted into the genome of the yellow fever virus. The new viruses grew in vertebrate or mosquito cells as well as their predecessors, although they did not share common mosquito vectors and reservoirs among vertebrates, and they differed in the clinical syndromes they caused.[6]

In 2001, a reassortant mousepox virus was constructed, into the genome of which the herpes simplex virus gene was inserted. In genetically resistant mice infected with the modified virus, there was an increase in the production of interleukin-4 and suppression of the cytolytic response of natural killers and cytotoxic T-lymphocytes. The fulminant mousepox with high mortality occurred even in the case of preliminary vaccination.[27]

Research on the creation of reassortant influenza viruses was not limited to work with the Spanish Flu only, but also spread to other strains. In particular, a 2008 publication states: "...we used reverse genetics to generate the 63 possible virus reassortants derived from H5N1 and H3N2 viruses, containing the H5N1 surface protein genes." Of the 63 reassortants, 13 posed the greatest threat to mammalian hosts. "...one of the most pathogenic reassortants contained avian PB1, resembling the 1957 and 1968 pandemic viruses."[8]

In September 2011, the 4th Conference of the European Scientific Working Group on Influenza was held in Malta,

where a number of reports were presented describing the creation of genetically modified viruses with enhanced or weakened pathogenic functions.

One of the reports was titled: *Why is HPAI H5N1 virus not transmissible via aerosol? An extensive mutational and phenotypic analysis of mutant and reassortant H5N1 viruses*. The Methods section says: "We introduced several known adaptation mutations and exchanged several gene segments in an attempt to adapt HPAI H5N1 virus for efficient replication and possibly transmission in mammals."[22]

Another report of the conference was devoted to the construction *in vitro* of reassortant viruses resistant to the Oseltamivir (Tamiflu). They were obtained by coinfection of Madin-Darby canine kidney cells with influenza viruses belonged to the resistant and susceptible to the Oseltamivir strains.[51]

At the conference there were presented the results of animal experiments in which spontaneous mixing occurred between wild-type influenza viruses and live viruses of the attenuated strain used for the vaccine. As it turned out, the new reassortants were not more dangerous than wild-type parents.[29] It was also reported that a new reassortant virus was found in one of the patients; it included genes from seasonal and pandemic influenza viruses, but this natural reassortant did not pose a pandemic risk.[56] Based on the results of these studies, it can be assumed that the occurrence in nature of reassortant viruses that could cause a pandemic is not a common issue.

In a study sent to the *Nature* in June 2015, and published in November 2015, scientists from the United States, China, and Switzerland explored the directions of possible mutations of the bat coronavirus, in which a relatively harmless virus would acquire new properties and be able to cause a pandemic in humans. Using the method of reverse genetics, a gene expressing the spike of the bat coronavirus SHC014 was introduced into the genome of the SARS-CoV virus. A new reassortant virus had the ability to effectively bind to angiotensin-converting enzyme 2, a receptor located on the cell membrane of various human tissues, as well as multiply in respiratory tract cells and achieve *in vitro* titers equivalent to epidemic strains of SARS-CoV. In addition, the resistance of the virus to the therapeutic and prophylactic drugs used to treat SARS was revealed. Based on their research, the authors expressed concern that the coronavirus could be the cause of a future pandemic.[32]

In 2018, Canadian and American scientists recreated the HPXV. Ten large DNA fragments of 10–30 Kb each were synthesized based on the nucleotides sequence of HPXV, and then they were assembled together, removing excess sections. The synthesized virus was less virulent in mice than modern vaccinia virus, yet it provided vaccine protection against lethal infection with the natural virus.[35]

In October 2022, Chen *et al*. described construction of a recombinant SARS-CoV-2 in which the gene encoding the spike protein of the Omicron virus variant was inserted into the genome of the original SARS-CoV-2 virus. The new virus, in an experiment, caused severe disease in mice with a mortality rate of up to 80%.[7]

Thus, since the very beginning of the emergence of technologies that allowed constructing reassortant (recombinant, hybrid, and chimeric) RNA and DNA molecules, study on creating new viruses which were not in nature have never stopped even during COVID-19 pandemic.

Restrictions on research leading to increased pathogenicity or transmissibility of the potential pandemic viruses

A number of the reports presented at the conference held in Malta in September 2011 caused a heated discussion among both scientists and journalists. On December 20, 2011, a spokesman for the National Science Advisory Board for Biosecurity stated that henceforth it is recommended that only the final results of experiments and conclusions be published, without a detailed description of the process used to create new dangerous viruses.[43]

On October 17, 2014, due to the growing threat of the emergence of new dangerous viruses in the environment, gain-of-function researches with the viruses in the United States were temporarily suspended.[14] However, on January 9, 2017, the moratorium was lifted. The commentary to the decree stated: "Adoption of these recommendations will satisfy the requirements for lifting the current moratorium on certain life sciences research that could enhance a pathogen's virulence and/or transmissibility to produce a potential pandemic pathogen."[45]

Cases of threats of leakage of dangerous pathogens from biological laboratories

Despite numerous statements that research on virus modification were carried out in laboratories with a high degree of safety, nevertheless, cases of violations of the rules for storing and transporting dangerous viruses outside the laboratories are known. Here are just a few examples.

On August 5, 2019, the *New York Times* published an article titled: "Deadly germ research is shut down at army lab over safety concerns." The laboratory, based in Fort Detrick, Maryland, contained about 70 highly dangerous pathogens and toxins, including those that cause Ebola, smallpox, anthrax and plague, and the poison ricin. The

reason for the closure of the laboratory was a problem with disposal of dangerous materials.[12] Research at the Fort Detrick laboratory was already suspended in 2009 due to the discovery of 9220 vials of pathogens which were not listed in the database.[23]

Another dangerous case occurred in January-February 2009, when the Austrian pharmaceutical company Baxter sent vials of "vaccine" against influenza (H3N2) to laboratories in Germany, Slovenia and the Czech Republic. After the introduction of the "vaccine" to ferrets, some animals died. When checking, it turned out that the "vaccine" contained a live bird flu virus (H5N1). In the first explanation regarding the incident, Baxter representatives stated that the vaccines were contaminated with a dangerous virus by accident, probably during packaging. Later, a spokesman for Baxter admitted that instead of vaccines, they sent "experimental virus material," but it was not noted in the accompanying documents.[31]

In 2004–2005, the College of American Pathologists sent test kits to more than 3700 laboratories in 18 countries, including Belgium, Brazil, Canada, France, Germany, Israel, Italy, Japan, Mexico, Singapore, and the USA. While testing some of the samples an influenza A/H2N2 virus was identified. This influenza virus circulated in humans at the beginning of the pandemic in 1957–58, but employees of the laboratories were not informed about the possibility of the presence of a dangerous virus in the kits sent to test their qualifications.[25]

DISCUSSION

This review suggests that the emergence of new genetically modified viruses became possible no later than the mid-1950s. In the ongoing studies, natural viruses were treated with various physical or chemical agents, and then they were selected depending on the weakening or strengthening of the pathogenic functions of the virus. As is known, the first pandemic caused by a reassortant virus, including the genes of the avian and human influenza viruses (H2N2), occurred in 1957–1958.[24]

Later it became possible to combine the genes of different viruses and insert the genes of some viruses into the genomes of other viruses. Since that time, the production of vector vaccines has begun, for which genetically modified reassortant viruses were used. The construction of viruses similar to SARS-CoV-2 became possible around the border of 1980s and 1990s. It is likely that the first reassortant virus, which included the genes of four different virus at the same time, was discovered in nature during the "swine flu" pandemic that began in the spring of 2009.[50]

At present, there are all the necessary technologies for assembling any full-sized virus based on the nucleotide sequence available in the virus database, or for creating a new artificial virus based on a virtual model offered by a computer.

CONCLUSION

The given above has confirmed that before the emergence of COVID-19 pandemic the ability of genetic engineering of the viruses was more advanced than needed to construct the virus which is similar to SARS-CoV-2. Thus, scientists around the world should support Neil Harrison and Jeffrey Sachs of Columbia University (USA) in calling for a thorough and independent investigation into the origin of SARS-CoV-2.[20] Only a full understanding of the origin of the new virus can minimize the likelihood of a similar pandemic in the future.[46]

THE FLU CASE

Only 3% of the people in Cracow, Poland, intend to get the swine flu jab

The Flu Case, 27 October 2009 21:18 Tuesday

https://web.archive.org/web/20091103121146/http://www.theflucase.com:80/index.php?option=com_content&view=article&id=1423:only-3-of-the-people-in-cracow-poland-intend-to-get-the-swine-flu-jab&catid=1:latest-news&Itemid=64&lang=sv

Only 3 % of the people in Cracow, Poland, intend to get the swine flu jab according to a poll carried out by Sanepid and reported on Radio Cracow. In Poland, the information about the dangers of the vaccines have been very actively spread online and the horrible deaths of several homeless people due to a "secret" vaccine experiment is still discussed in Poland.

ФОКУС

Сезонный грипп намного опаснее свиного, – считают польские медики

Фокус, 3 ноября 2009, 12:00
https://focus.ua/ukraine/76560

Министерство здравоохранения Польши считает более опасным для здоровья вирусы обычного сезонного гриппа, чем так называемого свиного. Польские медики говорят, что вероятность смерти от осложнений обычного гриппа намного выше, чем от A/H1N1.

Министр здравоохранения Польши Ева Копач на заседании пандемического комитета призвала не концентрировать свое внимание исключительно на случаях заболевания A/H1N1, подчеркнув, что от него в Польше не умер ни один из больных.

"Тех вирусов есть так много, что идентифицировать все как свиной безответственно", - сказала она.

Министр сообщила, что в Польше с момента появления свиного гриппа в мае этого года подтверждены 185 случаев из 700 подозрений, отметив, что этот вирус был намного менее вредным, нежели обычный сезонный грипп.

Как передает УНИАН, руководитель общенационального центра по делам гриппа профессор Лидия Бридак заявила, что лучшей профилактикой заболевания является прививка, которую за минувший сезон в Польше применили только около 5% из 38-миллионной Польши.

"Перестанем верить в мифы, что маска - это панацея..., это полумера", - сказала профессор.

Она также назвала более опасными вирусы обычного сезонного гриппа, нежели A/H1N1.

"Можем не дождаться вируса пандемического, а умереть от осложнений сезонного гриппа", - сказала Бридак.

Профессор также добавила, что в мире ежегодно гриппом болеет 1,5 миллиардов людей из 6,7 млрд. населения Земли, из которых умирает около одного миллиона.

По данным польских властей, на сегодня вирус гриппа распространяется в Украине в 10-12 раз быстрее, чем в Польше.

Власти самого большего западного соседа Украины в последнее время не зафиксировали роста заболеваний гриппом и ОВРИ в приграничных районах и самой стране и пока не предпринимали дополнительных мер в связи с эпидемией среди украинцев. Польская санэпидемическая служба только мониторит ситуацию.

В 46-миллионной Украине с середины прошлой недели количество больных вирусными инфекциями увеличилось в 7 раз - до свыше 250 тысяч, а количество госпитализированных в 15 раз - до 15 тысяч (большинство в западных областях).

В стране за последние две недели в западных областях умерли 72 человека, больше всего - 37 - во Львовской области, которая граничит непосредственно с Польшей.

Наличие вируса A/H1N1 подтверждено в 14 больных, из которых умерли 4 человека.

ФОКУС

Польша не будет покупать вакцину от A/H1N1, пока не доказана ее безопасность

Фокус, 3 ноября 2009, 12:20
https://focus.ua/ukraine/76560

Польские власти не планируют закупать вакцину от так называемого свиного гриппа (A/H1N1), пока не будут завершены исследования ее неопасности для человеческого организма.

Об этом заявила министр здравоохранения Ева Копач после заседания эпидемиологического комитета вчера вечером.

"Не будем проводить прививку людям плацебо, будем базироваться не на сплетнях, а на результатах клинических исследований", - отметила министр.

Копач подчеркнула, что польское правительство сейчас ведет переговоры о возможной покупке вакцин с тремя фирмами, отметив, что ни одна из них не завершила необходимые клинические исследования.

Кроме этого, до сих пор неизвестно, хватит ли для защиты от вируса одноразовой прививки или ее надо будет проводить дважды.

Копач сказала, что польские власти выступают за то, чтобы прививка от A/H1N1 была введена в свободное обращение, что сделало бы возможной ее покупку непосредственно гражданами, а не только правительствами стран, как есть сегодня.

Как передает УНИАН, министр заверила, что в случае подтверждения неопасности прививки польское правительство успеет купить ее к пику возможной эпидемии, которая может иметь место с января по март 2010 года.

Копач отметила, что немецкое правительство закупило 50 миллионов доз, из которых из-за низкой заинтересованности прививками использовано только 10 млн. Министр также заверила, что польские власти имеют необходимое оборудование и лекарства для того, чтобы не допустить эпидемии в Польше.

Она отказалась озвучить данные о запасах лекарств, которые имеет в своем распоряжении правительство, заметив только, что на лекарственных складах (из которых лекарства попадают в аптеки) есть 150 тысяч доз "Тамифлю" и 38 тысяч "Релензе".

Копач подчеркнула, что лекарство "Тамифлю" умышленно не были переданы в аптечное обращение в Польше, поскольку его использование при более легких заболеваниях гриппа привело бы к тому, что в случае сложной формы лекарства уже не подействуют.

Ранее сообщалось, что польское Министерство здравоохранения считает намного опаснее A/H1N1 вирус обычного сезонного гриппа, призывая поляков проводить прививку собственно от него.

В 38-миллионной Польше в последнее время не зафиксировано роста заболеваний вирусными инфекциями, из-за которых в западных областях Украины заболели свыше 250 тысяч человек, из которых 71 умер.

Panie Marszałku! Szanowna Pani Minister! Wysoka Izbo!

Występuję przed państwem jako przedstawiciel rządu z upoważnienia pani minister zdrowia Ewy Kopacz, ponieważ od stycznia 2008 r., czyli blisko od dwóch lat, pełnię funkcję przewodniczącego Krajowego Komitetu do spraw Pandemii Grypy.

Szanowni państwo, powiem kilka słów o statystykach, zgodnie z tym, o czym mówiła pani poseł. Dnia 4 listopada 2009 r. w Polsce potwierdzono łącznie 193 przypadki zakażenia wirusem grypy typu A/H1N1v. Łącznie od kwietnia 2009 r. w laboratoriach na terenie Polski przebadano ponad 1 tys. próbek, a pacjentów, u których potwierdzono zakażenie, w pierwszej fazie hospitalizowano. Następnie okazało się, że przebieg grypy jest na tyle łagodny, że pozostałe osoby są przede wszystkim odsyłane do domu, tylko nieliczni pacjenci trafiają do szpitali. Przeanalizujmy, jak wyglądała zachorowalność na przestrzeni kilku lat. W sezonie 2005/2006 zanotowano 274 tys. zachorowań na grypę, podkreślam: na grypę. W sezonie 2006/2007 - 349 tys. zachorowań, 2007/2008 - 235 tys., nieco mniej, i w sezonie 2008/2009 - 543 tys. osób chorych. Do dnia 31 października br., w tym sezonie jesienno-zimowym, zanotowano ponad 41 tys. zachorowań. Podkreślam, że chodzi o zachorowania na grypę, dlatego że w środowisku są różnego rodzaju wirusy grypy: wirus A, wirus typu B, wirusy paragrypy i wiele innych, a także ten nowy wirus A/H1N1. W związku z tym mówimy o grypie jako o zespole objawów chorobowych, które wywołują wirusy zbliżone do siebie, acz różniące się antygenowo. Ten właśnie nowy wirus spowodował, że 11 czerwca 2009 r. WHO ogłosiło pandemię grypy, biorąc pod uwagę przede wszystkim całkiem nowe, nieznane wcześniej kryteria, a mianowicie kryteria geograficznego rozprzestrzeniania się choroby, *a nie biorąc pod uwagę liczby przypadków i śmiertelności*.

Według danych WHO od kwietnia 2009 r. do 18 października 2009 r. w regionie Euro WHO - to nie jest tylko Unia Europejska, to są w sumie 53 kraje - wystąpiło ponad 64 tys. potwierdzonych przypadków zakażenia wirusem grypy typu A/H1N1, a na całym świecie wystąpiło ich łącznie 441 tys. Do tej pory tych przypadków jest więcej.

Myślę, że w tym momencie należy się państwu pewna statystyka porównawcza. Rocznie na grypę typową, tzw. sezonową, choruje ponad miliard ludzi na całym globie, z tego około miliona

umiera. Jeżeli porównamy te statystyki z nową grypą sezonową, okaże się, że tych zachorowań jest znacznie mniej w ciągu ostatniego pół roku, a pamiętajmy, że na południowej półkuli zima była wtedy, kiedy u nas było lato. W związku z tym ta grypa cały czas się szerzy. Jak państwo widzicie, tych przypadków było znacznie mniej i oczywiście śmiertelność była mniejsza niż w przypadku grypy sezonowej. Myślę, że jest to bardzo istotne stwierdzenie, które pokazuje, że tak naprawdę grypa sezonowa jest bardzo poważnym problemem, z którym zmagamy się od wielu lat, a który, miejmy nadzieję, że dzięki tej debacie, tej dyskusji i tym wszystkim informacjom, będzie lepiej identyfikowany i postrzegany przez naszych obywateli.

Krajowy Komitet do Spraw Pandemii Grypy, o którym wspomniałem i o którym mówiła pani poseł, prowadzi działania od roku 2005, kiedy to został powołany. Tak jak wspomniałem, przewodniczyłem mu od stycznia roku 2008. Są to typowe, rutynowe działania w ramach bardzo szerokiej koordynacji, bo w skład Krajowego Komitetu do Spraw Pandemii Grypy wchodzi wielu przedstawicieli z wielu resortów. W sumie jest to ok. 40 osób. Kluczowe resorty, poza resortem zdrowia, to: Ministerstwo Spraw Wewnętrznych i Administracji, Ministerstwo Obrony Narodowej, Ministerstwo Rolnictwa i Rozwoju Wsi, Ministerstwo Gospodarki i inne. Do głównych zadań komitetu należy: opracowywanie i aktualizacja, zgodnie z wymogami WHO, interdyscyplinarnego ″Polskiego planu pandemicznego″; przekazywanie przez członków komitetu kierownictwu resortów, organizacji i instytucji, których są przedstawicielami, ustaleń i wniosków wypracowanych przez komitet w celu ich wdrożenia zgodnie z ustawowymi kompetencjami; monitorowanie światowej i krajowej sytuacji epidemiologicznej grypy sezonowej oraz grypy ptaków; opracowywanie strategii dla podejmowanych działań profilaktycznych, diagnostycznych, leczniczych i organizacyjnych dla poszczególnych faz pandemii grypy, a także dokonywanie oceny zagrożenia oraz określanie zadań dla poszczególnych jednostek i służb oraz zakresu ich odpowiedzialności przy maksymalnym wykorzystaniu istniejących struktur działających w sytuacjach kryzysowych.

Od czasu przekazania informacji na temat potwierdzenia pierwszych przypadków zakażeń wirusem grypy typu A/H1N1v w Stanach Zjednoczonych i Meksyku, to jest od dnia 17 kwietnia 2009 r., Krajowy Komitet do Spraw Pandemii Grypy zebrał się osiem razy. Podczas jego posiedzeń analizowano obecną sytuację epidemiologiczną grypy w Polsce i na świecie oraz podjęte działania. Chciałbym państwu powiedzieć, że na posiedzeniu 8 września 2009 r. krajowy komitet wypracował rekomendacje dla ministra zdrowia dotyczące zwiększonej zachorowalności na grypę w ogóle oraz grup osób, które powinny, powtarzam: powinny otrzymać szczepionkę przeciw wirusowi grypy typu A/H1N1v w pierwszej kolejności. Załącznik, który mówi o tych rekomendacjach, jest bardzo istotny. Przeczytam jego ostatnie zdanie, w którym stwierdza się: Krajowy Komitet do Spraw Pandemii Grypy rekomenduje rozpoczęcie szczepień po uzyskaniu pełnej informacji o bezpieczeństwie i efektywności stosowania nowych szczepionek.

Jeśli chodzi o inne działania, które zostały podjęte przez Państwową Inspekcję Sanitarną, to jest ich bardzo dużo. Działania te są w pełni koordynowane przez głównego inspektora sanitarnego na poziomie wojewódzkich i powiatowych stacji sanitarno-epidemiologicznych. Na bieżąco odbywa się przekazywanie informacji z krajowych punktów kontaktowych z innych krajów do naszego krajowego punktu kontaktowego i na bieżąco są one analizowane. Chciałbym państwu powiedzieć, że ta wręcz ciągła analiza, można powiedzieć, godzinowa w ostatnim czasie, pokazuje, że obecna sytuacja w Polsce nie odbiega od sytuacji, które miały miejsce w poprzednich latach w tym zakresie. Nieznacznie zwiększa się liczba zachorowań, ale np. w województwach ściany wschodniej, jak porównamy miesiąc do miesiąca, w październiku liczba zachorowań per saldo była mniejsza niż we wrześniu br. Chciałbym powiedzieć, że w pełni analizujemy również sytuację na Ukrainie i Białorusi, pytanie dotyczyło ich sytuacji, i oceniamy działania, które zostały tam podjęte. Wiemy, że od całkiem niedawna, bo od kilku dni, działają eksperci zarówno z Europejskiego Centrum Zapobiegania i Kontroli Chorób, jak i z WHO. Liczymy na to, że te informacje, które zostaną przez tych ekspertów zweryfikowane, będą w pełni pewne, dlatego że informacje docierające szczególnie w początkowym okresie miały znamiona lekkiej dezinformacji. Chciałbym również powiedzieć, że na Białorusi liczba zachorowań wynosi ponad 300 tys. Odnotowano kilka zgonów i mniej więcej 1/3 tych zgonów była związana z grypą typu A/H1N1.

Jeśli chodzi o nasze działania na forum Unii Europejskiej, to są one bardzo szerokie. (Dzwonek) Stoimy na stanowisku, że ta szczepionka, która, jak słyszymy, jest bezpieczna i która powinna być szeroko stosowana, powinna być traktowana tak samo jak każda inna szczepionka, czyli powinna być dostępna na otwartym rynku, w aptekach, w pełni, bo to świadczyłoby o tym, że nie ma żadnej różnicy co do zasad strategii jej rejestracji i dalszego postępowania, jeśli chodzi o jej dystrybucję. Z inicjatywy pani minister zdrowia Ewy Kopacz takie działania już były wcześnie sygnalizowane na forum Unii Europejskiej - w najbliższym czasie, 11 listopada, ten problem stanie na spotkaniu COREPER i na pewno będzie 30 listopada jednym z punktów EBSCO, agendy Rady - ponieważ uważamy, że pełna dostępność do szczepionki jest podstawą efektywnego działania przeciw grypie. Chciałbym powiedzieć, że szczepionka jest tylko jednym z elementów, natomiast całościowy łańcuch postępowania w związku z grypą jest dobrze znany lekarzom. Byłoby dobrze, żeby pacjenci wiedzieli, jak postępować, a przede wszystkim, jak się jest chorym, należy iść do domu, skonsultować się z lekarzem i leczyć, a nie zarażać w środowisku miejsca pracy.

Chciałbym również odnieść się do kwestii, że ilość leków, taka pojawia się informacja, jest najprawdopodobniej niewystarczająca. Gwarantuję państwu, że zarówno analizy najczarniejszych opracowanych scenariuszy i raport przedstawiony prezydentowi Stanów Zjednoczonych, jak i najsławniejsze scenariusze, które zostały opracowane w Wielkiej Brytanii - zresztą sami ich twórcy mówią, że właściwie nie wiedzą, dlaczego przedstawiali aż takie czarne prognozy, bo nie ma możliwości, żeby tak się stało - wskazują na to, że tylko część chorych osób będzie hospitalizowana, a dodatkowo tylko część hospitalizowanych bezwzględnie wymaga klasycznego leczenia antyretro-wirusowego, przeciwwirusowego.

W związku z tym gwarantuję państwu, że w hurtowniach są leki, które w tej chwili dzięki decyzji ministra zdrowia zostały tam zatrzymane na potrzeby ewentualnego leczenia zwiększonej liczby chorych w szpitalach. Gdyby tej decyzji w odpowiednim czasie nie było, to te leki już by nie istniały i byłyby używane tak, jak w Wielkiej Brytanii, gdzie, jak państwo pamiętacie, chorzy byli leczeni przez telefon.

[Adam Fronczak]

Podsekretarz Stanu w Ministerstwie Zdrowia Adam Fronczak

https://orka2.sejm.gov.pl/Debata6.nsf/main/3943154B#050

Szanowny Panie Marszałku! Szanowna Pani Minister! Wysoka Izbo!

Dziękuję bardzo za dziesiątki pytań, które, tak jak mówiła pani poseł przed chwilą, świadczą o trosce. Pytania te można podzielić na trzy kategorie. Były pytania czysto merytoryczne, z którymi warto dyskutować czy ewentualnie polemizować, ale również pojawiały się niestety pytania o charakterze politycznym, a część pytań była zadana bezpośrednio pani minister.

Szanowni państwo, jeśli chodzi o tę polityczną grypę, która zaczyna przenikać na naszą salę, to można powiedzieć, że tak to się dzieje w niektórych krajach. Nie chcę mówić w których, bo państwo to wiecie. Jeżeli porównujemy te dwa kraje za naszą wschodnią granicą, to w jednym jest 4 razy mniej obywateli i podobna ilość zachorowań, i mamy normalne informacje, takie które nie mają charakteru medialnego, natomiast z innego kraju napływają informacje bardzo medialne, które powodują, że zaczynamy widzieć tego wirusa grypy politycznej również u nas.

Jeśli chodzi o nasze działania w ramach komitetu, o czym państwu wspominałem, to pracują w nim również eksperci. To nie jest tylko i wyłącznie stanowisko ministra zdrowia, to nie jest tak, że minister zdrowia itd. W ostateczności to jest stanowisko ministra zdrowia, ale ono jest wypracowane przy udziale wielu ekspertów, wielu osób, które są odpowiedzialne za działy, jakimi się zajmują, a w tym wypadku wirusologów, epidemiologów i przede wszystkim Krajowy Ośrodek do Spraw Grypy.

(Głos z sali: Pani profesor Brydak.) Pani profesor Brydak jest na sali.

Proszę państwa, wielokrotnie przewijało się tu słowo ″bezpieczeństwo″. Bezpieczeństwo to jest to, o co zabiega minister zdrowia. A ponieważ w ostatnim czasie pojawiają się różnego rodzaju doniesienia o różnych sprzecznych zjawiskach, a dodatkowo, tak jak państwo mówiliście, okazuje się, że w zawieranych w Europie umowach, jak i pewnych przedstawionych szkicach umów w naszym resorcie są z naszego punktu widzenia niedopuszczalne zapisy, dlatego negocjując z firmami, rozmawiając, chcemy usunąć te zapisy, bo to będzie dla nas probierzem tego, czy szczepionka jest w pełni bezpieczna, jeżeli te zapisy zostaną usunięte. Przy jakich innych preparatach, czy szczepionkach, czy lekach, mamy do czynienia z tak ekskluzywnymi zapisami w umowach, że to rząd bierze na

siebie odpowiedzialność za skutki stosowania tego preparatu? Ktoś produkuje, ktoś sprzedaje i nie bierze za to odpowiedzialności? O takiej ekskluzywności nie słyszałem w innych obszarach. To właśnie stało się między innymi przyczynkiem do tego, że musimy mieć pełną wiedzę, dlaczego tak jest, bo jeżeli jest wszystko OK, to znaczy, że można te zapisy usunąć i tak jak przy innych szczepionkach, innych lekach to firmy staną się odpowiedzialne za zdarzenia odległe, które mogą wystąpić po szczepieniach.

Jeśli chodzi o badania kliniczne, bo było takie pytanie, to one trwają. Z informacji, które posiadamy, wynika, że część z nich będzie zakończona w lutym lub w kwietniu, dlatego że tak naprawdę czwarta faza to jest obserwacja przypadków ludzi, którzy już zostali zaszczepieni, i zdarzeń, które mogą wystąpić.

Nie chciałem tego robić w pierwszej części swojego wystąpienia, ale niestety muszę zrobić to w drugiej, ponieważ część z państwa zadaje prowokujące pytania. W związku z tym, skoro zostałem sprowokowany, to pozwolę sobie odpowiedzieć, że doniesienia, które się pojawiają każdego dnia, zupełnie nowe, pokazują, że nie ma spójności w Europie w podejściu do tego problemu. To, że, jak państwo mówicie, WHO rekomenduje, zaleca Komisja Europejska, to jest prawda - zaleca, ale odpowiedzialność za to, co się dzieje na terenie danego kraju, bierze minister zdrowia, jeśli chodzi o bezpieczeństwo zdrowotne.

Proszę państwa, mamy taką sytuację, że jest najświeższa informacja, że w jednym z krajów, który zakupił bardzo dużą ilość szczepionek, *dwie osoby zmarły z powodu A/H1N1*, *a cztery osoby zmarły, tak się podejrzewa, co podkreślam, w związku ze szczepionką*, w ciągu kilku godzin po jej podaniu. Czy to nie jest sygnał dla ministra zdrowia? Czy tu nie zapala się czerwone światło? Wspomniana Wielka Brytania dopuszcza stosowanie szeroko szczepionki zawierającej adiuwanty, posiadającej rtęć we wszystkich grupach tzw. ryzyka i w całym społeczeństwie, ale inne państwo w Europie, ze swoim komitetem odpowiedzialnym za to, mówi ″stop″ tej szczepionce, nie zgadza się, aby dzieci do 18 roku życia ani kobiety ciężarne były zaszczepiane tym. To jest 2 tysiące kilometrów, proszę państwa, to jest wspólna filozofia, jeśli chodzi o Europę, a okazuje się, że tu jest diametralnie różne podejście. W związku z tym proszę dać ministrowi zdrowia czas na to, aby mógł w sposób konstruktywny, efektywny, przy pełnej wiedzy o zdarzeniach niepożądanych, które mogą wystąpić, przy pełnej ich świadomości podjąć właściwą decyzję. I o tym mówimy od samego początku, o niczym więcej.

Tu nie chodzi o pieniądze, a państwo próbujecie sugerować, że chcemy na czymś zaoszczędzić. Broń Boże, chcemy dać jak najlepszy produkt, jak najbezpieczniejszy, i nie możemy zgadzać się na taką sytuację, że proponuje nam się, mimo że nie produkowaliśmy tego leku, wzięcie za niego odpowiedzialności. To jest sytuacja, na którą nie ma zgody.

Jeśli chodzi o zapasy leków, to z jednej grupy posłów kierowano pytania, jak to jest, na pewno jest za mało tego leku, trzeba dokupywać, bo WHO mówi, że powinno być tyle, a na pewno tyle nie ma. Ale okazuje się, że wiceminister zdrowia z tej ekipy krytykował poprzednią ekipę, która dokonała zakupu tego leku. Zdecydujmy się w końcu, czy jesteśmy za tym lekiem cały czas, czy też incydentalnie, kiedy pojawia się temat grypy, to teraz nagle zaczynamy krytykować, że tego leku jest za mało, a kiedyś mówiliśmy, krytykowaliśmy lewicę, znaczy nie ja, broń Boże, że ten lek w ogóle jest niepotrzebny w kraju, że to są zmarnowane pieniądze. Były takie określenia. Możecie państwo wrócić do tych zapisów sprzed czterech lat.

Jeśli chodzi o kwestię wiedzy o tym, to chcę państwu powiedzieć, że rozporządzenie Rady Ministrów dotyczące art. 2 jasno mówi, że Agencja Rezerw Materiałowych i sprawy wszelkich zapasów, które są czynione w państwie, podlegają Ministerstwu Gospodarki. Minister gospodarki sporządza takie zestawienia i jest to utajnione. Jeżeli państwo na tej sali zmienicie prawo i pozwolicie ministrowi zdrowia czy ministrowi gospodarki na to odpowiedzieć, to to uczynimy. W tej chwili nie będziemy łamać prawa. (Oklaski)

(Głos z sali: Podobno w hurtowniach jest część.) *W hurtowniach jest część, to o tym mówiliśmy*.

(Minister Zdrowia Ewa Kopacz: *148 tys. dawek tamiflu, 38 tys. - relenzy*.)
Prawie 200 tys. dawek na leczenie tej choroby wirusowej.

Jeśli chodzi o inne kwestie, jest ich naprawdę bardzo dużo, ale najważniejsza, myślę, została wyjaśniona.

Chcę również państwu powiedzieć, że jest z nami pani profesor Brydak. Jeżeli pan marszałek zgodziłby się na to, żeby pani prof. Brydak mogła wystąpić, dosłownie przez minutę, która została do końca mojego wystąpienia, to myślę, że jako ekspert powie państwu, jak to naprawdę jest z tą grypą sezonową i A/H1N1.

(Głosy z sali: Nie ma takiego trybu.) – A jeżeli nie, to będę kontynuować, panie marszałku.

Polish Vice Health Minister Adam Fronczak in Parlliament on swine flu (AH1N1) vaccine deaths and issues

Polish Parlliament, 5 November 2009
https://www.youtube.com/watch?v=nXqEWl07olk&list=PL579700CA87CC3B5D&index=10

WICEMINISTER ZDROWIA
O SYTUACJI GRYPOWEJ W KRAJU
"Sytuacja w Polsce nie odbiega od sytuacji z ubiegłych lat"
"Liczba zachorowań wzrasta nieznacznie"
"Liczba zachorowań na wschodzie kraju jest mniejsza, niż w poprzednim miesiącu"
It was said here that WHO and
Eurpean Comminssion recommends the

Polish Vice Health Minister on swine flu vaccine (AH1N1). Here's a script of what he says:

It was said here that WHO and Eurpean Comminssion recommends the AH1N1 vaccines. Yes, it is true. But the responsibility lies with Health Ministry of every country in terms of health security of given country. And now we have a situation where in one country that bought a very large amount of vaccines... *2 people dies of AH1N1 and 4 people died in few hours after vaccine injection, allegedly of post-vaccinational complications*.

Isn't that a signal for Health Minister, doesn't it trigger an alert?

Great Britain widely allows vaccines that contain adjuvants containing mercury, for all social groups: so called risk groups and for the whole society.

But other countries with their pandemic comitees say: 'Stop to this vaccines. We do not allow neither the children up to 18 years of age nor pregnant women to be vaccinated with this jab!' This is only 1000-2000km away! It is the same European community, same philosophy but so different points of view!

Proszę Państwa!

Jeśli chodzi o szczepionki, o których cały czas mówimy, to każda z nich zawiera inną ilość antygenu, inną ilość środków dopełniających, tzw. adiuwantów. W związku z tym powstaje pewien niepokój, również dlatego, że najpierw dowiedzieliśmy się, w październiku, że są dwie dawki dla wszystkich szczepionek, potem, że jest jedna dawka, następnie, pod koniec października, znowu dwie dawki, ale być może jedna dawka będzie dla innego leku. Czyli zauważcie państwo, że to nie zostało przebadane. Nie ma jednoznacznych kryteriów w tej chwili, dotyczących nawet podawania szczepionki. W związku z tym jak minister zdrowia ma rekomendować szczepionkę, w przypadku której system dawkowania zmienia się w ciągu jednego miesiąca trzykrotnie. Chcemy ją zalecić wówczas, kiedy będziemy wiedzieli wszystko na temat bezpieczeństwa i również na temat dawkowania tej szczepionki.

Jeśli chodzi o pytania, bo padały jeszcze inne w zakresie aptek...

(Poseł Tadeusz Tomaszewski: **Punkty apteczne**.)

Proszę Państwa! Punkty apteczne są dostosowywane do prawa Unii Europejskiej. To nie jest tak, że sobie minister zdrowia coś wymyśla. Minister zdrowia działa zgodnie z prawem. W związku z tym nie mówmy o tym, że tego słynnego leku, którego nazwy nie mogę wymienić, żeby go tu nie promować, nie będzie. Z siedmiu preparatów o tej nazwie jeden wypadł z punktów aptecznych, a sześć pozostało. W związku z tym usuwamy tylko te leki, które mają bardzo dużą siłę działania i które mogą być niebezpieczne. A wszystkie inne, które są stosowane w takich właśnie sytuacjach jak przeziębienie, grypa sezonowa, jak najbardziej w tych punktach będą dostępne.

Pytanie, które dotyczyło tego, czy za trzy miesiące będzie szczepionka. Tak, ona pojawiła się, ale widzicie państwo, ile jest kontrowersji. Bez wyjaśnienia tych kontrowersji nie ma zgody z naszej strony na to, abyśmy mogli naszym obywatelom na terenie Rzeczypospolitej Polskiej oferować produkt, co do którego ani eksperci, ani Ministerstwo Zdrowia nie jest do końca przekonane. Jeżeli będziemy przekonani, to ten preparat zostanie sprowadzony do Polski.

(Poseł Tadeusz Tomaszewski: Dopłata do nadróbki.)

Nadróbki to jest problem, który już od kilku miesięcy cały czas się pojawia. Niektórzy z państwa zapomnieli o tym, że kolejna kwota, ponad pół miliarda złotych, została, nazwijmy to, wydobyta z Narodowego Funduszu Zdrowia w celu poprawy sytuacji szczególnie w tych regionach, gdzie ilość nadwykonań była duża. Minister zdrowia jednoznacznie wskazał kierunek wydatkowania tych pieniędzy. Różnego rodzaju były rozdziały środków, ale działamy w taki sposób, żeby za te nadróbki dzięki nowemu algorytmowi było zapłacone. W związku z tym powstaje jeszcze pytanie, w jakim procencie. Jak najwyższym.

Chcę państwu powiedzieć, że koordynacją z zakresu bezpieczeństwa na terenie RP zajmuje się również Rządowe Centrum Bezpieczeństwa. Pytaliście państwo, jak to wygląda, jaki jest przepływ informacji. Rządowe Centrum Bezpieczeństwa na swoim forum, swoim terenie urządza telekonferencje z wojewódzkimi inspektorami sanitarnymi, z innymi służbami. Uczestniczą w tym przedstawiciele resortu zdrowia i Głównego Inspektoratu Sanitarnego. I na bieżąco - takie telekonferencje są teraz bardzo często organizowane - jest przekazywana informacja o sytuacji epidemiologicznej w poszczególnych województwach. Do tej pory ilość zachorowań, o której mówiłem wcześniej, nie jest na tyle niepokojąca, żeby tworzyć czy podgrzewać atmosferę i doprowadzać do sytuacji wzrostu potężnego niepokoju. Nie ma powodu w tej chwili do niepokoju. Starałem się to wyjaśnić w moim wcześniejszym przemówieniu.

Jedno pytanie było skierowane personalnie do mnie, co prawda moje nazwisko nie było wymienione, było podane jakieś inne, ale wiem, że chodzi o mnie. Powiedziałem coś takiego, że przy ogłoszeniu pandemii zostały wzięte pod uwagę kryteria geograficzne. Sama Margaret Chan, szefowa WHO, mówiła, że nie wszystkie kryteria zostały wzięte pod uwagę. A mianowicie poza kryterium geograficznym, które jest znane od dawna, i tu się zgadzam z wypowiedzią pani poseł, jest jeszcze kwestia zjadliwości. A w przypadku zjadliwości, jeśli chodzi o tego wirusa, to kryterium nie zostało absolutnie wzięte pod uwagę. Wcześniej mówiono o geografii ptasiej grypy i mówiono o wysokiej zjadliwości również tego wirusa. Dziękuję bardzo. (Oklaski)

(Ewa Kopacz)

Polish Health Minister on swine flu jabs issues A/H1N1

Polish Parliament, 5 November 2009

video: https://www.youtube.com/watch?v=RhZesZe33cw
text: https://orka2.sejm.gov.pl/Debata6.nsf/main/6421D78B

Swine flu vaccines contaminated with avian (bird) flu. Producer admits on Polish TV (TVN).
"Would I give it to my elderly mother, or to my child?"

Panie Marszałku! Wysoka Izbo! Chcę państwu powiedzieć, że zasadę: ″Po pierwsze nie szkodzić″, którą wyznawałam, będąc przez dwadzieścia kilka lat lekarzem, przeniosłem do gabinetu na Miodową. Nie ma w tym nic złego. I nie dopatruję się w tym niczego złego. Wręcz przeciwnie. W sytuacji, w której miałabym zaaplikować pacjentowi jakikolwiek lek, u każdego z nas, kto pracuje w ochronie zdrowia i ordynuje ten lek, przez ułamek sekundy pojawia się myśl: czy dałabym to swojej wiekowej mamie lub swojemu dziecku? I takie myśli, właśnie takie myśli, spowodowały, że stałam się bardzo skrupulatna, jeśli chodzi o sprawdzanie informacji o leku, który minister zdrowia ma zarekomendować Polakom. Nie sobie, za to biorę sama odpowiedzialność, jeśli w aptece kupuję sobie preparat bez recepty i go połykam, ale właśnie milionom Polaków, którzy nie mają wiedzy medycznej i nie muszą jej mieć, ale liczą na wiedzę, którą posiada minister czy specjalista, jakim jest pani prof. Brydak. Specjalista, który od 40 lat pracuje nad grypą w jednym ze 189 ośrodków badania grypy na świecie. Jeden z tych 189 ośrodków jest w Polsce. Czy dzisiaj można nam zarzucać niewiedzę o grypie? Czy można teraz kwestionować opinię pani profesor, która od 40 lat pracuje nad

grypą, nie jednym rodzajem grypy, wydała tysiące publikacji na ten temat. Toteż mam tylko jedno zasadnicze pytanie: Czy dzisiaj chcemy walczyć z pandemią grypy, czy chcemy walczyć z ministrem zdrowia przy okazji zachorowań na grypę? (Oklaski) I bardzo państwa proszę, abyście państwo zrozumieli jedną rzecz. Te wątpliwości nie biorą się w związku z istnieniem takiego normalnego polskiego uporu, że oto minister zdrowia pomyślała sobie: będę inna niż wszyscy inni ministrowie.

My dzisiaj mamy wiedzę na temat tego, jakie klauzule są zawarte w innych umowach, które podpisywane były przez rządy innych państw, dużo zamożniejszych. I wiemy również, jaką zaproponowano Polsce umowę. Dzisiaj ze względu na ochronę negocjacji, które toczymy, ja państwu nie mogę przytoczyć szczegółów tej umowy, ale jedno mogę powiedzieć: departament prawny znalazł tam co najmniej 20 punktów spornych. A więc czy obowiązkiem ministra i rządu jest doprowadzić do tego, aby zawierać umowy zgodne z interesem państwa i pacjentów polskich, czy też z interesem firm farmaceutycznych? (Oklaski)

Jeśli dzisiaj wiem, że na rynku dostępne są trzy szczepionki trzech różnych firm, a każda z nich, ja nie zdradzam tu tajemnicy, ma inną zawartość substancji czynnej, to nie zastanawia państwa to, że mimo iż w każdej z nich obecność substancji czynnej jest inna, są traktowane tak samo? Czy dzisiaj minister zdrowia i fachowcy, którzy to oceniają, nie mają choćby przez moment wątpliwości co do tego, że może ta, która zawiera tę substancję czynną w śladowych ilościach, jest po prostu wodą święconą, a nie szczepionką? (Oklaski) Za to mamy zapłacić?

Dzisiaj mamy przykład Niemiec, w których oczywiście kupiono 50 mln dawek szczepionki, z czego wykorzystano na chwilę obecną niecałe 10 mln. 13% populacji Niemiec chce za ten cudowny lek dzisiaj zapłacić i chce się zaszczepić. Ale dla przykładu powiem państwu, że właśnie to Niemcy, co dziwne, przodują w jednym - w wyszczepialności na grypę sezonową. Jeśli na 1000 mieszkańców w Polsce na grypę sezonową szczepi się 52 Polaków, to w Niemczech szczepi się 228 osób. Co nagle takiego się stało - tam jest przecież tradycja szczepień - co się stało, że rząd kupił szczepionkę, zaoferował, a oni mówią: 13%, czyli mniej niż na sezonową chce się szczepić? Czy to są powody, nad którymi powinniśmy się zastanawiać, czy też nie? Także ci, którzy decydują o tym, że wprowadzają preparat, który dzisiaj jest w pewnym sensie owiany tajemnicą, bo jeśli państwo zobaczylibyście dokumenty rejestracyjne, to nie mamy tam wyszczególnionej ilości adiuwantu.

Ale też pamiętajmy o jednej rzeczy, że są tzw. strony niepożądane odczynów poszczepiennych, strony, które obligują wszystkich tych, którzy dany preparat wyprodukowali, do informowania o tych niepożądanych skutkach, które się zdarzyły po szczepieniu. Szczepimy się od początku października, na świecie szczepią się ludzie od początku października. Chcę, żeby ktokolwiek z państwa na tej stronie znalazł choć jeden paradoksalny objaw uboczny, choć jeden - wysypka, uczulenie. To się przy najbardziej bezpiecznym leku może zdarzać. Nie ma, jest pusto, cudowny lek. A skoro taki cudowny, to dlaczego firma nie chce go wprowadzić na rynek, biorąc odpowiedzialność za swój lek? Jeśli cudowny i bezpieczny, to biorę za to odpowiedzialność, wprowadzam go na rynek, wszystko jest transparentne i nie obciąża strony, która kupuje ten lek, płaci za to. Ta strona, która kupuje, nie ma wglądu w badania, nie ma wglądu również w skład szczegółowy i nie zna wyników, które pokazują w tej czwartej fazie, czy są jakiekolwiek minimalne działania uboczne po szczepieniu.

Zobaczcie, państwo, co się wydarzyło. Krótki okres badań, ale też jaka mała populacja. Jedna firma przeprowadza badania na 160 zdrowych ochotnikach w wieku od 20 do 60 lat, inna firma oferująca tę szczepionkę na 600 osobach zdrowych od 18. do 60. roku życia. Czy to nam, tu obecnym, szczególnie lekarzom, wystarcza do tego, żeby powiedzieć: tak, szczepimy się tą szczepionką przeciw tej grypie? Mnie nie wystarcza. Chcę mieć pewność, oczywiście nigdy stuprocentowej mieć nie będę, albo przynajmniej taką wiedzę, która pozwoli mi to zarekomendować przed ukończeniem negocjacji. My nie wypadliśmy z kolejki po tę szczepionkę. Ten czas do momentu podpisania tejże umowy, jeśli taka decyzja zapadnie - rekomendowana oczywiście będzie przez komitet pandemiczny - chcemy wykorzystać do maksymalnego pozyskania wiedzy o bezpiecznym produkcie, który chcemy zakupić dla państwa - lub też nie, jeśli się okaże, że będzie niezbyt doskonały.

A więc dzisiaj zadaję sobie pytanie: Jeśli na całym świecie miliard ludzi choruje na grypę sezonową, umiera milion z tego powodu, to czy ktoś - a grypa sezonowa nie występuje u nas od roku, od dwóch lat - z tego względu ogłaszał pandemię? Mało tego, okazuje się, że te wirusy grypy sezonowej są zdecydowanie gorsze, bardziej zjadliwe, nawet powodujące skutki śmiertelne i ciężkie powikłania. Czy ktoś właśnie z tego powodu ogłaszał pandemię? Może ci, którzy dzisiaj mnie namawiają do tego, żebym tak chętnie kupowała szczepionki na grypę A/H1N1, wiedząc, że w Polsce mamy 193 przypadki zdiagnozowane na 1000 przypadków sprawdzonych, z tego tylko 124 osoby były hospitalizowane, a z tych 124 podania tamiflu wymagało 100 osób? Czyli jaka jest zjadliwość tego wirusa w porównaniu z normalnym wirusem grypy, tym sezonowym? Zdecydowanie mniejsza. I dlaczego akurat przy tym wirusie jest taka histeria, a przy poprzednich, występujących tyle lat, zbierających żniwo śmiertelne, nie było takiej paniki, nie było takiej determinacji? Tych, którzy dzisiaj dopingują mnie do zakupu tej szczepionki, pytam, dlaczego zlekceważyli objawy grypy sezonowej w ubiegłym roku, dwa lata temu, trzy lata temu i w roku 2003. W roku 2003 w Polsce na grypę sezonową zachorowało ponad 1200 tys. osób. Czy ktoś wtedy mówił o tym na tej sali, a przecież parlament był, istniał, czy tu rozrywano szaty i krzyczano: ″Kupmy wszystkim szczepionki na grypę sezonową″? Ja sobie tego nie przypominam. My dzisiaj uczciwie mówimy: skoro grypa sezonowa jest groźniejsza, szczepcie się państwo przeciwko tej grypie. Mało tego, widzimy wzrost wyszczepialności. Co robimy? Otóż rząd podjął bardzo szybkie działania, żeby za kilka dni trafiły kolejne setki szczepionek do naszych aptek i hurtowni. To jest rozsądne działanie.

A więc na koniec chcę państwu powiedzieć tylko jedno: Polacy to bardzo mądry naród.

(Poseł Teresa Wargocka: W tym nasza nadzieja.)

Polacy bardzo dokładnie potrafią odróżnić to, co jest prawdą, od kłamstwa i potrafią również odróżnić to, co jest obiektywną oceną sytuacji, od gry politycznej. Za to Polaków bardzo szanuję. I chcę powiedzieć, że bardzo mi przykro, kiedy przekonuję się, że na tej sali w imię prawdy można oszukiwać Polaków. Tę ostatnią kwestię kieruję do tych wszystkich, którzy przebierają nogami w tej chwili po to, aby wywrzeć nacisk na ministra zdrowia i zmusić go do działań, za które bardzo chętnie albo jeszcze chętniej byście mnie rozliczali, gdyby się okazało, że coś jest nie tak. Właśnie to wy zarzucalibyście mi niestaranność, to wy zarzucalibyście mi brak wyobraźni, a dzisiaj zarzucacie mi przewlekanie w czasie. Powtarzam: w Polsce na 193 przypadki chorych na grypę A/H1N1 nie zszedł z tego świata ani jeden pacjent. Ci wszyscy ludzie w większości, czyli w ponad 50%, przechorowali tę grypę w domu. W związku z tym bardzo proszę Wysoką Izbę przede wszystkim o wsparcie dla ministra, który chce być wyjątkowo i odpowiedzialnym, i ostrożnym, chce dbać, co jest oczywiste w przypadku ministra zdrowia, o życie i zdrowie polskich pacjentów. Dziękuję bardzo. (Oklaski)

(Poseł Krystyna Skowrońska: Brawo, pani minister!)

Vaccination contre la grippe H1N1: Discours de la ministre polonaise de la santé devant le parlement

Vaccins, 5 novembre 2009
http://vaccins.biz/Discours.htm
http://initiativecitoyenne.be/article-la-pologne-refuse-les-vaccins-h1n1-39381434.html

«Je voudrais dire que ma priorité pendant mes 20 ans de pratique de médecine générale a été «d'abord ne pas nuire» J'ai toujours à l'esprit ce principe en tant que Ministre de la Santé.

Dans ma pratique, quand je recommandais un médicament à qui que ce soit, je crois comme chaque praticien leferait, je me posais simplement la question : est-ce que je préconiserais cela pour ma vieille maman, pour mon enfant?

Ce type de pensée est révélatrice de toute la prudence que je dois avoir, des vérifications et des garanties dont je dois m'assurer en tant que Ministre de la Santé avant de préconiser un médicament à chaque citoyen polonais

A des millions de Polonais qui n'ont pas de formation médicale qu'un ministre ou un expert peut avoir comme le professeur Brydack par exemple qui a, en tant qu'expert, travaillé pendant plus de 40 ans sur la grippe.

Il travaille dans un des 189 centres de recherche sur la grippe dans le monde, un de ces centres se trouvant en Pologne. Pouvons-nous aujourd'hui être accusés d'un manque de connaissances sur la grippe?

Pouvons-nous remettre en question l'opinion d'un professeur qui travaille sur la grippe depuis plus de 40 ans et pas seulement sur un seul type de grippe ? Quelqu'un qui a publié des centaines d'articles sur le sujet? Je me pose seulement une question fondamentale : voulons-nous combattre la grippe pandémique?

Aujourd'hui, nous savons la teneur de différentes clauses des contrats que d'autres, beaucoup de gouvernements de pays riches ont signé avec les fabricants de vaccins.

Nous savons aussi ce qui a été proposé à l'état polonais. Suite aux négociations en cours, je ne peux pas tout dire aujourd'hui mais je peux dire une chose :

Notre département juridique a trouvé au moins 20 points douteux dans le contrat.

Or, quel est le devoir du Ministre de la Santé ? Signer des contrats qui sont dans le meilleur intérêt des Polonais ou bien signer des contrats qui sont dans le meilleur intérêt des compagnies pharmaceutiques?

Je sais qu'il y a 3 vaccins disponibles sur le marché aujourd'hui, de 3 producteurs différents. Chacun a une quantité de substance active différente et, étrangement, ils sont tous jugés équivalents?

N'est-ce pas suffisamment étrange pour que le Ministre de la Santé et les experts aient au minimum de légers doutes à ce sujet ?

Peut-être, si ça se trouve, le produit avec très peu de substances actives n'est juste qu'une «eau miraculeuse» que nous supposons pouvoir agir sur la grippe? Sommes-nous supposés payer pour cela?

Nous avons l'exemple de l'Allemagne qui a acheté 50 millions de doses, seulement 10% ont été utilisées jusqu'ici. 13% des Allemands sont disposés à accepter ce « remède miracle » aujourd'hui.

Mais c'est vraiment peu parce qu'en Allemagne, il y a un grand pourcentage de gens favorables à la vaccination.

Ainsi, en Pologne, sur 1000 personnes, 52 personnes feront le vaccin antigrippal (classique) alors qu'en Allemagne, ils sont 238 pour 1000 (23%)

Donc, qu'est-ce qui fait que seulement 10% des Allemands veulent se faire vacciner contre la grippe porcine et pas 23% de la population comme pour la grippe saisonnière? Leur gouvernement achète ces vaccins et les leur propose gratuitement et les gens ne les veulent pas? Comment cela se fait-il?

Est-ce que ces faits peuvent nous donner des arrière pensées concernant le fait d'acheter ou non ces vaccins? Des arrières pensées concernant le fait d'introduire un médicament qui serait une sorte de médicament secret? Il y a des sites internet sur lesquels les fabricants de vaccins ont l'obligation de publier les effets secondaires inattendus des vaccins. La vaccination en Europe a commencé le 1er octobre 2009.

Je voudrais que vous visitiez n'importe lequel de ces sites et que vous me trouviez un seul de ces effets secondaires inattendus, ne serait-ce qu'une réaction dermatologique généralisée, ce qui peut arriver même avec des médicaments sûrs.

Il n'y en a aucun sur ces sites internet.

Un médicament « parfait ».

Et puisque c'est si miraculeux, pourquoi la firme productrice ne veut pas introduire son produit sur le marché en acceptant d'assumer la responsabilité de celui-ci ? Pourquoi ne disent-ils pas: c'est un produit merveilleusement sûr c'est pourquoi nous prenons la responsabilité de celui-ci, nous allons le mettre sur le marché et tout est clair et transparent plutôt que de mettre la pression sur nous, les acheteurs?

Nous n'avons pas les résultats de tests cliniques, pas de détails sur les composants et pas d'informations sur les effets secondaires. Les vaccins en sont maintenant à une phase 4 de tests, des tests vraiment très courts et nous ne disposons toujours pas de ces informations. De plus, l'échantillon (de testeurs) était vraiment petit : un type de vaccins a été testé sur seulement 160 volontaires âgés de 20 à 60 ans, tous sains, pas infectés.

Un autre type de vaccin a été testé sur 600 volontaires âgés de 18 à 60 ans, tous bien portants. Est-ce que c'est suffisamment consistant pour nous les médecins présents dans cette salle ? Ce n'est pas suffisant à mes yeux.

Je veux être suffisamment sure avant de recommander cette vaccination.

Nous ne sommes pas définitivement hors jeu pour l'achat de vaccins.

Pendant le temps des négociations (en cours), nous voulons prendre le temps et l'utiliser à bon escient pour obtenir autant d'informations que possible sur le vaccin.

Ensuite, si le comité de lutte anti-pandémique finit par approuver le vaccin, alors nous l'achèterons.

En outre, il y a 1 milliard de gens qui font la grippe saisonnière chaque année, 1 millions en meurent chaque année. Et c'est le cas non pas depuis 1 an ou 2 mais depuis des années.

Est-ce que quelqu'un a déjà annoncé une pandémie de grippe saisonnière quelque part dans le monde ? Et pourtant la grippe saisonnière est bien plus dangereuse que la grippe porcine. Il y a même des décès et de graves complications.

Y a-t-il eu la moindre pandémie (de grippe saisonnière) qui ait été annoncée?

Dès lors, à celui qui me pousse à acheter des vaccins (contre la grippe pandémique), je vous demande : Pourquoi n'avez-vous pas crié ou pleuré pour qu'on en achète l'année dernière, il y a 2 ans et en 2003. En 2003, il y a eu 1, 2 millions de Polonais qui ont fait la grippe saisonnière!

Est-ce que quiconque dans cette salle a alors crié « achetons des vaccins pour tout le monde!» ?? Je ne peux pas ne pas rappeler cela.

Et, en conclusion, je voudrais dire seulement une chose : la nation polonaise a beaucoup de sagesse. Les Polonais savent distinguer la vérité du mensonge très précisément. Ils peuvent aussi déterminer ce qui constitue une situation objective et ce qui n'est qu'un jeu.

THE FLU CASE

Polish Health Minister cut off after accusing WHO of spreading disinformation in Ukraine

The Flu Case, 5 November 2009

https://web.archive.org/web/20100102021401/http://theflucase.com/index.php?option=com_content&view=article&id=1613%3Apolish-health-minister-cut-off-after-accusing-who-of-spreading-disinformation-in-ukraine&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Polish Health Minister cut off after accusing WHO of spreading disinformation in Ukraine. - The Flu Case, 5 November 2009, 11:24

TV transmission of a live parliamentary debate in Poland was cut off for fifteen minutes today after the Polish Health Minister Ewa Kopacz said that WHO was spreading disinformation in the Ukraine concerning the "swine flu" pandemic.

Kopacz has come under fierce criticism from some quarters after she said she will resist pressure to press ahead with the mass vaccination of the population with untested swine flu jabs that could cause damage and death to more people than the swine flu.

The unexpected interruption of the TV and website transmission of the debate in parliament will fuel fears that portions of the Polish media and government allied to big pharma and banks are censoring critics of WHO and of the toxic and untested swine flu jabs.

The Polish Health Minister was cut off in the middle of answering questions on the „swine flu“ jab and footage of French President Nicholas Sarkozy was shown, it is reported.

Kopacz has been celebrated as a "hero" by the general public for her stance in putting the health of the general public before the profits of big pharma and WHO.

Polish Health Minister, a family doctor, tells Parliament she will not allow use of untested swine flu jabs: reveals secret contracts violate the law

The Flu Case, 5 November 2009, 11:59
https://web.archive.org/web/20100106085046/http://www.theflucase.com/index.php?option=com_content&view=article&id=1618%3Aupdate-polish-health-minister-a-family-doctor-tells-parliament-she-will-not-allow-use-of-untested-swine-flu-jabs-reveals-secret-contracts-violate-the-law&catid=41%3Ahighlig

The Polish Health Minister Eva Kopacz today told Parliament during a heated debate on the swine flu vaccination that she, as a qualified family doctor with more than 20 year of experience, will not authorise the use of untested vaccines on millions of people in Poland when there is inadequate information about the safety of the jabs.

She said the secret contract that the Polish government was supposed to sign with pharmaceutical companies had more than 20 clauses which are against the law.

Kopacz noted that governments in Western Europe had signed secret agreements with pharmaceutical companies, but suggested that the prosperity of the people of Poland was more important to her than the profits of Big Pharma.

She noted that there are three vaccines proposed for Poland with different types of adjuvants and was concerned that these vaccines were all being treated as if they were the same.

In addition, she observed that only 13 % of the people in Germany want to take the swine flu jab even though 5 times more people in Germany take the regular flu shot than in Poland, and asked why the Germans are so unwilling to take the jab.

She said there was secrecy surrounding the contents of the vaccines. There is no information about the amount of adjuvants in the vaccinesm, she added.

Furthermore, the family doctor and Health Minister said there is absolutely no information about the side effects of the swine flu jab. The pharmaceutical companies did not want to take responsibilty for the jab.

Also, she said that trials for the swine flu jab were being conducted on a relatively small number of healthy people and that these were not adequate for her to recommend the jab.

Moreover, Kopacz said that the regular flu was much more common and dangerous than the swine flu - and yet no pandemic had been declared over the seasonal flu.

Why is there such a panic about the swine flu virus? She asked.

Kopacz said that the Polish people can tell the difference between objective facts and the truth and lies.

She noted that all 193 people who allegedly had the swine flu in Poland had survived.

Finally, she called on the people of Poland to show their support for her as she comes under growing pressure from the pushers of the "swine flu" jab to give the people the dangerous and untested jab.

Piecha: Kopacz nie ma zielonego pojęcia o szczepionkach

Wprost, 5 Listopada 2009
https://www.wprost.pl/tylko-u-nas/177276/piecha-kopacz-nie-ma-zielonego-pojecia-o-szczepionkach.html

Przewodniczący Komisji Zdrowia doktor Bolesław Grzegorz Piecha na początku rozmowy zastrzegł, że wiceminister zdrowia sam stwierdził, że nie wie, czy zgony mają związek ze szczepionkami. Lekarz podkreślił też, że każdy lek ma jakieś działanie uboczne, „ale nie jest to żaden powód, dla którego mielibyśmy nie szczepić Polaków". Następnie zwrócił uwagę, że podważanie bezpieczeństwa lekarstw, to podważanie kompetencji agencji farmaceutycznych.

- Od wydania takiego orzeczenia są specjalne instytucje farmaceutyczne i specjalistyczne, które dostają pieniądze za wydawanie takich opinii. Musimy ufać specjalistom, bo są oni najlepszym źródłem rzetelnych informacji. Szczepienie na grypę jest jak na razie najskuteczniejszym środkiem zaradczym – komentuje poseł.

Następnie Piecha podkreślił, że pani minister nie jest kompetentna do wydawania orzeczeń o szkodliwości leków.

- Pani minister jest urzędniczką i nie ma zielonego pojęcia o działaniu szczepionek. Mamy swoich specjalistów w WHO, mamy w Komisji Zdrowia. Czemu Pani minister nie spyta ich o zdanie? Nie wiem, z jakiego powodu nasze ministerstwo nie ufa nikomu – zastanawia się Piecha.

Poseł tłumaczy, że prawdziwym powodem nie zakupienia szczepionek jest to, że minister zdrowia liczyła na zakupienie leków przez Unię Europejską.

- Oczywiście wygrały egoistyczne interesy krajów i Niemcy kupują dla Niemców, a Francuzi dla Francuzów. Pani Kopacz pozostała w złudnym przeświadczeniu, że wszystko zrobi za nas Unia Europejska. Mam nadzieję, że w końcu za jakiś tydzień szczepionki jednak trafią do Polski – tłumaczy doktor. - Natomiast podawanie informacji o śmierci spowodowanej szczepionką to jest właśnie sianie paniki i promowanie spiskowej teorii dziejów. => English

Piecha: Minister Kopacz does not have a clue about vaccines

Wprost, 5/13 Listopada 2009
https://www.wprost.pl/tylko-u-nas/177276/piecha-kopacz-nie-ma-zielonego-pojecia-o-szczepionkach.html
https://jagahost.proboards.com/thread/7611/polish-health-ministry-blasts-vaccinations

The Ministry of Health did not purchase vaccines against the A/H1N1 flu because five vaccinated EU citizens had died. “Minister Kopacz does not have a clue about vaccines”, said Boles³aw Piecha to gover.pl.

Doctor Boles³aw Grzegorz Piecha, who is the chairman of the Health Committee warned in the beginning of the interview that deputy health minister had said himself that he did not know whether the deaths had been vaccine-related. The doctor also emphasised that every drug has a side-effect, "but it should not prevent us from vaccinating Poles". He then drew attention to the fact that undermining the safety of a drug is the same as undermining the competence of pharmaceutical agencies.

"There are special pharmaceutical institutions that determine this and they are paid to give such opinions. We have to trust specialist because they are the best source of reliable information. For now flu vaccines are the most effective remedy," commented the MP.

Then Piecha emphasised that Minister Kopacz is not competent to determine whether a given drug is harmful or not.

"Mrs. Kopacz is a clerk and she does not have a clue about the effectiveness of vaccines. WHO and Health Committee have their own specialists. Why will Mrs. Kopacz not ask them what they think? I don’t know why our Health Ministry does not trust anyone," said Piecha.

According to him the real reason why vaccines will not be purchased is that the Ministry of Health hoped that they would be bought by the EU.

Polish Prime Minister:
Donald Tusk, pressured by EC on swine flu (AH1N1) vaccines

Poland won't buy H1N1 vaccine until 'properly tested'

CTV News, The Associated Press, 6 November 2009, 2:05 PM EST
https://www.ctvnews.ca/poland-won-t-buy-h1n1-vaccine-until-properly-tested-1.451528

Warsaw, Poland – Polish Prime Minister Donald Tusk says his government won't buy vaccines for swine flu that have not been properly tested or from producers who won't take responsibility for possible side effects.

Tusk told reporters Friday that vaccine producers were pressuring governments to buy, but were also demanding that all responsibility and compensation for possible side effects should fall upon the governments purchasing the medicine.

He stressed that the few dozen swine cases in Poland have been mild and no deaths have been reported.

Poland distrustful of swine flu vaccination

Kyiv Post, Associated Press, 6 November 2009, 4:44 pm
https://archive.kyivpost.com/article/content/eastern-europe/poland-distrustful-of-swine-flu-vaccination-2-52080.html

Warsaw, Poland (AP) – Polish Prime Minister Donald Tusk saidNov. 6that his government won't buy vaccines for swine flu that have not been properly tested or from producers who won't take responsibility for possible side effects.

Tusk told reporters that vaccine producers were pressuring governments to buy, but were also demanding that all responsibility and compensation for possible negative side effects fall upon government shoulders.

"Today we are dealing with great pressure from pharmaceutical firms … we are dealing with expectations that hundreds of millions of zlotys (dollars) will be spent on vaccine while no one wants to guarantee that it has no side effects," he said.

He stressed that the few dozen swine cases in Poland have been mild and no deaths have been reported.

Some independent health experts have been advising vaccination after a recent surge in flu cases in neighboring Ukraine saw more than 700, 000 cases and 109 deaths of people with flu-like illness in recent weeks.

Fourteen of the fatalities were swine flu cases, Polish news agency PAP reported, citing Ukraine's chief doctor Oleksandr Bilovol.

Polish health officials said a military medical laboratory in Pulawy was testing samples taken in Ukraine from sick people. Poland is also sending face masks to Ukraine.

On Thursday, the World Health Organization said that the swine flu virus has become the predominant flu strain worldwide.

In some countries, swine flu accounts for up to 70 percent of the flu viruses being sampled, according to Dr. Keiji Fukuda, WHO's top flu official.

While most people recover from the illness without needing medical treatment, officials are also continuing to see severe cases in people under 65 – people who are not usually at risk during regular flu seasons.

LE FIGARO · fr

La Pologne refuse les vaccins H1N1

Le Figaro // AFP, 6 Novembre 2009, 16:46
https://web.archive.org/web/20091109023154/http://www.lefigaro.fr/flash-actu/2009/11/06/01011-20091106FILWWW00529-la-pologne-refuse-les-vaccins-h1n1.php

Le premier ministre polonais Donald Tusk a accusé aujourd'hui les sociétés pharmaceutiques de chercher à rejeter sur les gouvernements la responsabilité pour d'éventuels effets secondaires des vaccins contre la grippe H1N1, justifiant ainsi le refus de la Pologne de les acquérir.

"Nous savons que les sociétés qui offrent les vaccins contre la grippe H1N1 ne veulent pas prendre la responsabilité des effets secondaires de ce vaccin", a déclaré Tusk à la presse. "Elles refusent de les mettre sur le marché, parce que leur responsabilité juridique serait alors plus grande. Elles demandent des clauses qui ne sont probablement pas conformes à la législation polonaise, et qui rejettent toute la responsabilité sur le gouvernement d'un pays en ce qui concerne les effets secondaires et des indemnisations éventuelles,", a-t-il ajouté.

La Pologne refuse pour l'instant d'acheter des vaccins contre la grippe H1N1, estimant qu'ils n'ont pas encore été suffisamment testés par les autorités médicales.

THE FLU CASE

Polish Prime Minister says swine flu hysteria generated by pharmaceutical lobby

The Flu Case, 7 November 2009, 10:11
https://web.archive.org/web/20100102033846/http://theflucase.com/index.php?option=com_content&view=article&id=1676%3Apolish-prime-minister-says-swine-flu-hysteria-generated-by-big-pharma-for-profits&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Polish Prime Minister Donald Tusk said yesterday that the lobbyists of pharmaceutical companies were responsible for creating the hysteria sweeping the globe over the „swine flu“ virus.

According to a report on the Polish TV channel, TVN24, Tusk said that the hysteria over the swine flu was being created in order to force governments to pay out millions on contracts for pandemic vaccines.

Tusk said that the Polish government would not spend large sums on vaccines for the relatively harmless swine flu when the seasonal flu kills more people.

Also, he criticised the pharmaceutical companies for trying to shift their responsibility for paying compensation for any death and damage that their vaccines cause onto the government.

"We know that the companies that are offering the vaccines against the H1N1 flu do not want to take responsibility for the secondary effects of the vaccine. They refuse to put [the vaccines] onto their market because their legal responsibility will be larger. They demand clauses which are probably not in conformity with Polish laws, and which pass all responsibilty to the government of a country for the secondary effects and eventual compensation,“ Tusk said, according to the AFP.

Tusk expressed support for the stance of the Health Minister Ewa Kopacz, a family doctor, who has refused to buy the swine flu jabs on the grounds they are not adequately tested by the medical authorities.

The Polish Deputy Minister for Health Adam Fronczak also noted that more people had died in the swine flu vaccines than from the actual virus in one country, apparently Sweden, according to TVN24.

"In one of the countries where there was a big contract for vaccines, two people died because of h1n1 but four people allegedly died a few hours after vaccination,“ he said.

The Swedish government has distributed more than a million doses of swine flu vaccines but there are no government figures available on how many jabs have been given to people making it impossible to assess the damage being caused by the vaccine. Also, there is only very limited or no requirement to report damage caused by the swine flu jab in Sweden.

Kopacz o szczepionkach: Dlaczego tak nalegacie?

Kopacz on vaccines: Why are you so insistent?

TVN24, Polska, 9 listopada 2009, 23:20 / 10 listopada 2009, 5:37
https://tvn24.pl/polska/kopacz-o-szczepionkach-dlaczego-tak-nalegacie-ra114908-3699855

Marek Balicki atakuje Ewę Kopacz za niepodpisanie umowy na zakup szczepionki przeciw świńskiej grypie. Ona nie pozostaje mu dłużna. - Kiedy pan był ministrem, w 2003 roku była największa liczba zachorowań na grypę sezonową - 1,2 mln, a nie ogłaszał pan epidemii. Skąd teraz taka determinacja pana i pana kolegów - pytała minister zdrowia w programie "Teraz My!".

Ewa Kopacz zdziwiona jest dzisiejszą postawą Balickiego, który wielokrotnie w ostatnich dniach apelował o podpisanie przez rząd umowy z dostawcą szczepionki przeciw grypie typu A/H1N1. Zarzuca mu, że kiedy sam był ministrem zdrowia w rządzie SLD, zmagał się z największą falą zachorowań na grypę sezonową w ostatniej dekadzie, ale epidemii nie ogłaszał. - Lek Tamiflu kupił pan na dwa tygodnie przed swoim odejściem (w październiku 2005 roku, kiedy był szefem resortu w rządzie Marka Belki - red.) - przypomina Kopacz.

Chcą pieniędzy bez odpowiedzialności

Na zarzuty, że już dawno powinna podpisać umowę z producentem szczepionki, obecna minister zdrowia odpowiada przypominając to, co słyszeliśmy już wielokrotnie - że firmy farmaceutyczne chcą "zarobić szybkie pieniądze", a nie chcą odpowiadać za bezpieczeństwo pacjentów.

- Kiedy rząd uzyska od firm, z którymi negocjujemy odpowiedź potwierdzającą bezpieczeństwo szczepionek, to umowę podpiszemy. Teraz jednak firmy chcą, żeby rząd za szczepionki zapłacił, ale nie chcą wziąć na siebie odpowiedzialności za ich działanie. Pytamy: dlaczego? - powtarzała Ewa Kopacz.

Balicki spokojny

- Lek ten został dopuszczony przez Europejską Agencję ds. Oceny Produktów Leczniczych, jestem więc spokojny - odpowiadał Marek Balicki.

Jego zdaniem, "po raz pierwszy w tym stuleciu stoimy w niebezpieczeństwie epidemii" a "obowiązkiem rządu jest dbać nie tylko o zdrowie poszczególnych obywateli, ale też całego społeczeństwa". - Ta umowa powinna być już zawarta, żebyśmy mogli skutecznie zaszczepić się przeciw grypie - uważa Balicki.

Kopacz on vaccines: Why are you so insistent?

[*google translation*]

Marek Balicki attacks Ewa Kopacz for not signing a contract for the purchase of a swine flu vaccine. She owes him nothing. – When you were a minister, in 2003 there was the highest number of cases of seasonal flu – 1.2 million, and you did not announce an epidemic. Why are you and your colleagues so determined now - the Minister of Health asked in the "Teraz My!" program.

Ewa Kopacz is surprised by today's attitude of Balicki, who has appealed many times in recent days for the government to sign a contract with the supplier of the A/H1N1 influenza vaccine. He accuses him of having struggled with the largest wave of seasonal flu in the last decade when he was the minister of health in the SLD government, but did not announce the epidemic. – You bought the drug Tamiflu two weeks before your departure - recalls Kopacz. (in October 2005, when he was the head of the ministry in the government of Marek Belka - ed.)

They want money without responsibility

To allegations that she should have signed a contract with a vaccine manufacturer a long time ago, the current health minister responds by recalling what we have heard many times – that pharmaceutical companies want to "make quick money" and do not want to be responsible for patient safety. – When the government receives from the companies with which we are negotiating an answer confirming the safety of vaccines, we will sign the contract. Now, however, the companies want the government to pay for the vaccines, but they do not want to take responsibility for their operation. We ask: why? – repeated Ewa Kopacz.

Balicki calm

- This drug has been approved by the European Agency for the Evaluation of Medicinal Products, so I am calm – replied Marek Balicki.

In his opinion, "for the first time in this century, we are in danger of an epidemic" and "the duty of the government is to take care not only of the health of individual citizens, but also of the entire society." – This agreement should already be concluded so that we can effectively vaccinate against influenza - believes Balicki.

THE FLU CASE

Polish Health Minister says no swine flu jabs unless pharma companies accept liability

The Flu Case, 10 November 2009
https://web.archive.org/web/20100102033753/http://theflucase.com/index.php?option=com_content&view=article&id=1717%3Apolish-health-minister-says-no-swine-flu-jabs-unless-pharma-companies-accept-liability&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Polish Health Minister and family doctor Ewa Kopacz has said she will only sign a contract for the swine flu jabs if pharmaceutical companies agree to accept liability and take responsibility for paying compensation in the even that the vaccines cause damage or death.

"I will sign only when pharamceutical companies take responsibility of the vaccines. I guarantee it," Kopacz is reported to have said on Polish TV.

The unwillingness of the pharmaceutical companies to accept any liability for their vaccines has fuelled fears that they are well aware of how pontentially damaging these jabs are, especially for children and pregnant women, and have positioned themselves in advance to avoid claims.

Pharmaceutical companies have not conducted clinical trials on the new vaccines contanining mercury and squalene. The safety and effectiveness of the swine flu vaccine does not have to be proven before they are administered to people under special pandemic emergency vaccine approval guidelines issued by the European drug regulator, the EMEA.

The Europen Union has also passed a decree that gives pharmaceutical companies blanket immunity in the event of their vaccines causing damaging if a pandemic emergency is declared.

ИНФОРМАГЕНТСТВО FORUM

В Польше разгорает скандал с прививками от гриппа
Вакцина не прошла исследования

Forum, 10 ноября 2009, 13:52
https://for-ua.com/article/389163

Министр здравоохранения Польши Ева Копач считает массированную критику министерства за отказ от закупки вакцины против гриппа A/H1N1 до завершения клинических исследований о ее безопасности желанием производителей «быстро заработать» на ее продажах.

Об этом министр заявила в прямом эфире TVN24 во время дискуссии по этому вопросу с бывшим руководителем Министерства здравоохранения РП Мареком Балицким, который в последнее время очень активно критикует Копач за промедление с закупкой партий вакцины против гриппа A/H1N1.

Копач в очередной раз подтвердила, что, несмотря на мощное давление, не планирует изменять свою точку зрения и закупать вакцину против нового гриппа до окончания исследований по ее безопасности.

«Когда правительство получит от фирм, с которыми мы ведем переговоры, ответ о безопасности прививок, то подпишем договор. Однако фирмы хотят, чтобы правительство заплатило за вакцину, но не хотят взять на себя ответственность за ее действие», - сказала министр.

Копач отметила, что в 2003 году, когда Балицкий был министром здравоохранения, в Польше был зарегистрирован самый высокий уровень заболеваемости гриппом за последние десять лет - заболели 1,2 млн. людей 36-миллионной страны, и не были объявлены никакие экстренные противоэпидемические меры.

«Откуда сегодня у вас и ваших коллег такая настойчивость (в вопросе вакцинации против пандемического гриппа)?», - спросила министр, сообщает «УНИАН».

Она добавила, что Балицкий лишь в октябре 2005 года решил закупить препарат «Тамифлю», который считается одним из наиболее сильных противогриппозных лекарств, но в то же время, по данным медиков, имеет ряд не до конца проверенных побочных эффектов.

В свою очередь, Балицкий заявил, что уверен в безопасности вакцины против «калифорнийского» гриппа, потому что Европейское агентство по оценке медицинских продуктов предоставило разрешение на использование этой вакцины в странах ЕС.

Он также заявил, что Польше «впервые за последние сто лет угрожает эпидемия, и правительство обязано заботиться не только о здоровье отдельных граждан, но и всей нации».

В Польше практически в 100% случаях заболевания гриппом A/H1N1 болезнь проходила в более легкой форме, чем у больных обычным гриппом.

В 2008-2009 годах обычным гриппом заболели 540 тысяч поляков, в то время как новым гриппом, который появился в Польше в мае этого года, заболели более 210 человек, ни один из них не умер.

По данным ВОЗ, с апреля по ноябрь текущего года в мире гриппом A/H1N1 заболели около 440 тысяч человек, из которых 5,7 тысяч умерли.

В то же время обычным гриппом ежегодно болеет около миллиарда людей, из которых умирает миллион.

Как ранее писал ForUm, от гриппа и острой респираторной вирусной инфекции в Украине по состоянию на 9 ноября ***умерло 174 человека.***

Премьер-министр Украины Юлия Тимошенко попросила Всемирную организацию здравоохранения (ВОЗ) помочь ***обеспечить украинцев вакциной*** против гриппа A/H1N1 (свиного гриппа).

В свою очередь, руководитель бюро Всемирной организации здравоохранения (ВОЗ) в Украине Игорь Поканевич *призывает украинскую власть* провести переговоры по заключению контрактов на поставки вакцины против гриппа A/H1N1 с руководителями стран, где такая вакцина есть.

Swine flu vaccines contaminated with avian (bird) flu.

Nur für Besucher
Baxter
We turned to Baxter company for some answers.
Baxter limited itself to writen statement that was
sent to us, in which we read among others:

This is a 5 minute material from a TV show called "Teraz my" ("Now us") broadcasted on 9/11/2009 on biggest Polish private station TVN. The program is very respected and has very large audience so this is real mass media in Poland, I mean total mainstream media.

The hosts invited current Polish Health Minister Ewa Kopacz (against the flu), and former Polish Health Minister Marek Balicki.

He kept on saying actually one thing: "but WHO and EMA recommended it, are you trying to be smarter and jeopardize health of millions of Poles?"

Current Minister kept bringing up the issues stated in her appearance in Polish Parliament, you can watch it here: RE: Polish Health ...

Former Minister is either naive or full of shit and made a fool of himself the way he behaved, and she came out really good with the message.

The hosts ended the show with a conclusion that the doubts are very reasonable and that it is disturbing how big pharma and big politics are making big shady businesses above our heads.

It starts becoming a public subject now and it looks really good folks!

THE FLU CASE

Polish people support Health Minister in rejecting untested swine flu jab

The Flu Case, 13 November 2009 17:24

https://web.archive.org/web/20100102044306/http://theflucase.com/index.php?option=com_content&view=article&id=1780%3Apolish-people-support-health-minister-in-rejecting-untested-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The Polish Health Minister and family doctor Ewa Kopacz is enjoying strong support among the general public for insisting on better tests for any swine flu jab and on the pharmaceutical companies accepting responsibility, according to local media.

"Spokesperson for Civil Rights" Dr Janusz Kochanowski has said that Kopacz should be prosecuted for putting the lives of Polish citizens at risk by rejecting the contract with big pharma. But Polish officials sprang to Kopacz's defence, saying that if anyone should be prosecuted, then it should be Kochnanowski for risking the lives of Poles .

In spite of fierce criticism from the big pharma lobby and their allies, the Polish Health Ministry has said they will not accept the "swine flu" jabs unless pharmaceutical companies accept liability for any damaged caused by the vaccines.

domik

Из паники – в Пофигизм

Domik Новости, 13 ноября 2009
https://domik.ua/novosti/iz-paniki---v-pofigizm-n69513.html

Киевские власти говорят, что в городе - 31 больной свиным гриппом и 6 смертей. Власть, к ужасу иммунологов, требует немедленной вакцинации.

...

А Польша неисследованной вакциной прививаться не будет...

Вакцинироваться от сезонного гриппа надо, от свиного - тоже. Но вот Ева Копач, глава польского Минздрава, отказалась проводить вакцинацию от A/H1 N1, пока фирмы, делающие вакцину, не предоставят результаты исследований ее безопасности. Критику в свой адрес Копач объяснила тем, что производители хотят быстрей заработать на вакцине, но не хотят брать на себя ответственность, если она вдруг нанесет вред. Украину это отчего-то не пугает.

Так или иначе, «Газета...» не раз печатала заявления иммунологов: делать прививку надо не во время эпидемии, а хотя бы парой недель раньше, чтобы иммунитет успел сформироваться. Есть и более жесткие мнения.

– Прививать во время эпидемии – это преступление! – считает ученый секретарь института микробиологии и иммунологии имени Мечникова Артур Мартынов. - Вы не отличите здорового человека от того, кто только что переболел в очень легкой форме, введете ему вакцину - и можете вызвать тяжелейший рецидив!

The Sydney Morning Herald

Poland reports first swine flu death

The Sydney Morning Herald, 15 November 2009, 10.24 am
https://www.smh.com.au/world/poland-reports-first-swine-flu-death-20091115-ifzu.html

Swine flu has claimed its first victim in Poland, after a 37-year-old man died of respiratory complications, a medical official said.

Jerzy Karpinski, head of the medical service in the Gdansk region of northern Poland, told reporters that tests had confirmed the presence of the H1N1 virus in the man who died Friday afternoon in hospital.

The individual had initially been hospitalised with suspected severe pneumonia in the northern town of Puck, before being transferred Thursday to Gdansk's contagious diseases unit.

A specialised laboratory in the northern city of Olsztyn confirmed the presence of the H1N1 virus Saturday, he said.

Poland has so far recorded 237 cases of swine flu.

The government, however, has decided to hold off buying vaccines against the virus, arguing that those on offer have not yet been sufficiently tested.

Earlier this month, Polish Prime Minister Donald Tusk slammed drug companies selling swine flu vaccines for allegedly refusing to take legal responsibility for any possible side effects.

He also claimed that mass vaccination programmes in other countries seemed excessive and out of step with the real epidemic.

More than 6,250 people have died worldwide since the swine flu pandemic was first discovered in April in Mexico, according to the most recent World Health Organisation data, with more than two-thirds of victims in the Americas.

THE FLU CASE

Nighttime aerosol spraying by planes reported in Poland

The Flu Case, 16 November 2009

https://web.archive.org/web/20100102040228/http://theflucase.com/index.php?option=com_content&view=article&id=1815%3Anighttime-aerosol-spraying-by-planes-reported-in-poland&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Reports are coming in from Poland that airplanes carrying out aerosol spraying have been flying in the middle of the night. Planes were reported in the Gdansk area and in the south east. A pilot reported hearing an aircraft noise that he could not identify in the night time.

The reports of airplanes carrying out spraying in the night are similar to the ones from western Ukraine when low flying light airplanes carrying out aerosol spraying over Ukrainian cities were seen during the days of October 29, 2009 and October 31, 2009 just before huge numbers of people began to get sick and the first deaths from the pneumonia plague were diagnosed.

The Ukraine government issued a statement denying that it was doing any aerial spraying to combat the growing disease or authorizing any spraying over Ukrainian cities.

The Ukraine government has since implemented a state of emergency, postponed elections, banned public meetings, closed some of its borders, ordered the arrest of critics of vaccinations and is also prepared for a mass forced vaccination programme with the toxic and untested swine flu jab.

WHO has acquired extraordinary powers over the Ukraine as a result of this emergency declaration under the pretext of fighting a pandemic.

WHO and Baxter have been linked to bioterrorism activities and the release of the pneumonic plague by a number of analysts.

There are no reports of pneumomic plague in Poland so far.

THE FLU CASE

Are Poland and Austria at the forefront of an undeclared biological war?

The Flu Case, 16 November 2009, 23:05

https://web.archive.org/web/20100102024224/http://theflucase.com/index.php?option=com_content&view=article&id=1826%3Aare-poland-and-austria-at-the-forefront-of-an-undeclared-biological-war&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Eyewitness reports from Poland and Austria indicate that both countries are being subjected to new kinds of aerosoal spraying by aircraft.

This seems to be an attempt to trigger a pandemic in the same way as occured in the Ukraine recently when pneumonia plague emerged after reports of night time aerosol spraying by low flying planes.

Three aircraft flying in formation were seen at night time in Klagenfurt one month ago apparently on a spraying operation.

New types of spraying were seen in eastern and southern Austria today.

This is one report from Lower Austria:

"I followed your homepage today and saw that you put up that link where you reported that in Villach new types of Chemtrails have been laid by Chemtrail Aircrafts to set the real flu pandemic in motion here as well.

I am covering Chemtrails for at least 6 months, also putting them online via youtube under my youtube name "Silberhorter".

On Sunday when I went out in our garden in Lower Austria (near Wr. Neustadt) I recognized massive spraying activity on almost unprecedented scale. I will upload this action tomorrow night. The spraying was done by new kind of airplanes with strange colors on them (yellow, red. I also detected one plane to put the trigger on and off twice. you can see this action on the video taken on Sunday 15.11.09: http://www.youtube.com/watch?v=N661mbZ5XrY [deleted]

Do you have more info about this new kind of Chemtrail acts? Was it from Sunday? Because today it was already completely cloudy (must be the result of yesterdays spraying acts, because the sky was completely covered with intense mist only 1 hour after they attacked).

If you have more info please let me know to compare it with what I saw on Sunday. What I took notice of was that the trails lingered quite fast and that all sort of different tactics and planes were carried out...

If you check on my channel on Wednesday morning you should see a summary of this Chemtrail activity of Sunday, 15.11.09 near Wr. Neustadt."

wprost

Kopacz:

w 2009 roku pięć razy częściej chorujemy na grypę

WPost, 17 Listopada 2009

https://www.wprost.pl/kraj/178387/kopacz-w-2009-roku-piec-razy-czesciej-chorujemy-na-grype.html

Od 1 września do 15 listopada na grypę sezonową oraz wywołaną wirusem A/H1N1 zachorowało w Polsce 107 250 osób. W ubiegłym roku w tym samym okresie zachorowało 24 843 pacjentów - poinformowała minister zdrowia Ewa Kopacz po posiedzeniu Komitetu Pandemicznego. Dodała, że tak duży wzrost zachorowań świadczy o obecności w Polsce nowego wirusa A/H1N1, który szybko się rozprzestrzenia.

Kopacz uspokoiła jednak, że zgodnie z obserwacjami Światowej Organizacji Zdrowia (WHO) u 80 procent wszystkich zainfekowanych nowym wirusem choroba ma bardzo łagodny przebieg, a u 10 procent pacjentów kończy się bezobjawowo lub bardzo skąpymi objawami, takimi jak np. katar. Minister zaznaczyła, że trzy osoby, które zmarły w wyniku powikłań pogrypowych, a które miały nowego wirusa, "były obciążone dodatkowymi schorzeniami, które miały szczególny wpływ na ich odporność".

Mamy szczepionkę na grypę sezonową

Minister Kopacz poinformowała, że komitet pandemiczny podjął decyzję, by od 75 do 80 tys. kuracji leku antywirusowego Tamiflu z zakupionych rezerw trafiło do aptek. Dzięki temu lekarze pierwszego kontaktu będą mogli wdrożyć leczenie antywirusowe. - Dokładne instrukcje w tym zakresie lekarze dostaną w najbliższym czasie - powiedziała minister Kopacz. Minister poinformowała też, że Polska zakupiła ok. 40 tysięcy dawek szczepionki sezonowej, a wkrótce do Polski ma trafić także jeszcze 273 tys. dawek szczepionki dla grup ryzyka. Zaznaczyła, że chodzi o to, by stosując szczepionkę przeciw grypie sezonowej zmniejszyć ryzyko przeciw A/H1N1.

Świńska grypa nie zabiła mieszkańca Myślenic...

Dziś okazało się również, że przyczyną zgonu 28-latka z Myślenic, który zmarł w nocy z soboty na niedzielę w Szpitalu Uniwersyteckim w Krakowie nie była grypa typu A H1N1. Rzeczniczka Wojewódzkiej Stacji Sanitarno-Epidemiologicznej w Krakowie Anna Armatys poinformowała, że badania wszystkich próbek pobranych od pacjenta wykazały, że nie chorował on na tzw. świńską grypę.

...ale zabiła mieszkankę Gdańska

Do zgonu osoby chorej na grypę spowodowaną wirusem A/H1N1 doszło natomiast w Gdańsku, gdzie zmarła 54-letnia kobieta chora na tzw. świńską grypę. To czwarta ofiara wirusa A/H1N1 w Polsce.

THE FLU CASE

Pneumonic plague reported in Eastern Poland

The Flu Case, 18 November 2009 19:40

https://web.archive.org/web/20100102034436/http://theflucase.com/index.php?option=com_content&view=article&id=1861%3Apneumonic-plague-reported-in-eastern-poland&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Reports are coming in of people dying of symptoms similar to the pneunomic plague in an Emergency Room in Bialystok in the north east of Poland.

A doctor reported treating three patients with symptoms similar to the pneumonic plague, including burned lungs. One the patients died in his arms. The doctor said that it appeared be a bacterial infection and that no antibiotics worked. He also thought it could be a more virulent strain of the swine flu.

The victims came from small villages close to Bialystok.

Low flying aircraft were heard in the region a few nights ago.

Cases similar to the pneumonic plague have also be reported in Lithuania, close to the Polish border and to Bialystok.

The appearance of something resembling the pneumonic plague in Poland shortly after low flying aircraft made carried out unexplained missions during the night time in the same area has parallels with the recent incident in the Ukraine.

Witnesses reported low flying planes carrying out aerosol spraying shortly before the pneumonic plague was diagnosed in victims a few days later.

The Ukrainian government and WHO moved swiftly to declare the swine flu virus had mutated to become more dangerous and implement martial law.

This is an email from Poland:

My friend a doctor who works in Emergency Room in Bialystok (Eastern North of Poland) called me saying that he had 3 cases of patients with symptoms similar to the pneumonic plague. "If it is H1N1, so it means that it has changed for very virulent form and it kills in matter of hours". One patient died in his hands. I do not know what happened to other two. He is going to inform me how's the situation, but he expects it to get much worse. No antibiotic works for the disease!

THE FLU CASE

Unusual aircraft activity reported in Poland and the UK

The Flu Case, 18 November 2009 22:28

https://web.archive.org/web/20100102004119/http://theflucase.com/index.php?option=com_content&view=article&id=1868%3Aunusual-aircraft-activity-reported-in-poland-and-the-uk-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"There seems to be something going on in derby uk the last 2nights kept me awake last night low flying either helicopters or planes it is earlier tonight started 11ish and it was 3 till 5 am this morning? we took a picture from our phone tonight i will get my husband to send it to you shortly. it is a helicopter tonight looking over the grounds with lights at first it looked like it was spraying with the tensity of the light, but i do hear another either plane or helicopter flying around its still going ´....ps close to our house at the moment," email from Derby resident.

"Also above Warsaw (now!) There is a report from near Okecie (Airport) that for 25 minuts large propeller plane is flying circles, The plane is quite low. There are no planes departing Okecie at this time. It is the first time our reader heard such a plane for for long time," email from Poland.

Low flying planes reported in the UK and Poland tonight

The Flu Case, 18 November 2009 21:37

https://web.archive.org/web/20100102051329/http://theflucase.com/index.php?option=com_content&view=article&id=1867%3Alow-flying-planes-reported-in-the-uk-and-poland-tonight&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Reports are coming in of planes flying low tonight over Cracow in Poland also over Derby in the Peak District in the UK.

"We're getting info from our readers in England - there are several slow and low flying planes over Derby "working" for a quite long time (inf from 11;07PM), there is a high wind."

More unusual aircraft activity over Poland

The Flu Case, 19 November 2009 10:14

https://web.archive.org/web/20100102035156/http://theflucase.com/index.php?option=com_content&view=article&id=1870%3Amore-unusual-aircraft-activity-over-poland&catid=41%3Ahighlighted-news&Itemid=105&lang=en

More reports are coming in of unusual aircraft activity across Poland in the last few days similar in kind to the activity that was reported to have preceded the outbreak of strange pneumonic plague in the Ukraine.

Emails from Poland:

"More reports about strange planes today during the day.

* Elk, NE Poland, close to Bialystok (more to north and Lithuania), the closest airport is 200km!

* Warsaw again."

"Another report - huge planes yesterday near Gdansk (sound like bombers from II WW). Today morning I heard very low flying huge propeller aircraft in my nieghbourhood, but it's not the first time, I live under the "corridor""

"Also above Warsaw (now!) There is a report from near Okecie (Airport) that for 25 minuts large propeller plane is flying circles, The plane is quite low. There are no planes departing Okecie at this time. It is the first time our reader heard such a plane for for long time."

Take Control of Your Health

Dr. Mercola. Major Victory with Swine Flu Scandal

Mercola, 19 November 2009.
http://articles.mercola.com/sites/articles/archive/2009/11/19/Major-Victory-with-Swine-Flu-Scandal.aspx (deleted)
https://web.archive.org/web/20100102054653/http://theflucase.com/index.php?option=com_content&view=article&id=1877%3Amajor-victory-with-swine-flu-scandal-reports-dr-mercola&catid=1%3Alatest-news&Itemid=64&lang=en

European scientists and health authorities are facing angry questions about why H1N1 flu has not caused death and destruction on the scale first feared, and they need to respond deftly to ensure public support.

...

Prominent Doctor and Health Minister Blast Swine Flu Vaccine and Manufacturers

These healthy signs are starting to crop up everywhere.

For example, the Polish Health Minister Eva Kopacz recently told Parliament that she, as a qualified family doctor with more than 20 years of experience, will not authorize the use of vaccines with inadequate safety testing on millions of people in Poland.

In her speech she says:

"I have just one fundamental question: do we want to fight the flu pandemic?

"Today we have knowledge about enclosures in agreements that other governments of wealthier countries have signed with vaccines producers. We also know what was proposed to Poland.

Due to negotiations in progress I can't tell all today. But I can tell one thing: our Law Department found at least 20 points of doubt in the agreement.

So what is a Health Minister's duty? To sign agreements that are in the best interest of the Polish people, or to sign agreements that are of best interest of pharmaceutical companies?

I know that there are three vaccines available on the market today, from three different producers. Each has a different amount of active substance, and yet strangely they are all treated the same. Therefore, isn't it fair enough for the Health Minister and the experts to have the slightest doubts about it?

… And if [the vaccine] is so miraculous, then why don't the manufacturers want to introduce their medicine to the free market and take responsibility for it?

Why wouldn't they say: "Wonderful, this is a safe medicine, therefore I will take responsibility for it. I will introduce it to the market and everything is clear and transparent," instead of dropping the weight on us – the buyers.

We do not have clinical test results, no detailed ingredients and no information about the side effects. The vaccines are now in the 4th stage of tests - very short tests, and we still do not have this information. In addition, the samples have been very small. One kind of vaccine was tested only on 160 volunteers aged 20-60, all healthy.

Another kind of vaccine was tested on 600 volunteers, aged 18-60, all healthy. *Is this good enough, especially for us doctors present in this room*? *– It is not good enough for me.*

… Has anybody, anywhere, announced a pandemic because of seasonal flu? And the seasonal flu is much more dangerous than swine flu. There are deaths and severe complications. Was there ever a pandemic announced before?

Those who push me to buy vaccines, I ask you: Why didn't you scream and shout last year, 2 years ago, and in 2003? In 2003 there were 1,200,000 Poles with seasonal flu! Has anybody shouted, here in this room: "Let's buy vaccines for everybody!"? I can't recall such a thing."

THE FLU CASE

Polish Health Minister says only 293 out of 107,250 flu cases were swine flu, three deaths now reported

The Flu Case, 20 November 2009, 16:32

https://web.archive.org/web/20100117060025/http://theflucase.com/?option=com_content&view=article&id=1995%3Apolish-health-minister-says-only-293-out-of-107250-flu-cases-were-swine-flu-three-deaths-now-reported&catid=41%3Ahighlighted-news&Itemid=105&lang=en&fontstyle=f-smaller

Polish Health Minister Ewa Kopacz said that the country has experienced four times more cases of seasonal flu than at the same time last year. Of the 107,250 Poles who came down with the flu, the H1N1 swine flu virus was, however, only found in 293 of them.

10 of these people with the swine flu virus had serious symptoms and three have died from the swine flu in a rapid surge in deaths in the past few days.

=>

Warschau – In einer Pressekonferenz teilte die polnische Gesundheitsministerin Ewa Kopacz am späten Dienstag Nachmittag mit, dass man es in Polen derzeit mit einer Vervierfachung der Fälle von saisonalen Grippen im Vergleich zum selben Zeitraum des Vorjahres zu tun habe.

Dies habe nach Ansicht von Experten aber mehr klimatische denn epidemische Gründe, denn der Winter hatte dieses Mal bereits im Oktober kräftig zugeschlagen.

Ab dem 1. September erkrankten 107 250 Polen an einer Grippe. Nur in 293 von ihnen fand man das Virus H1N1, hiervon zeigten 10 Patienten schwere Symptome.

3 Menschen starben bisher in verschiedenen Teilen des Landes. Mindestens zwei der Todesopfer hatten auch andere Krankheiten, beim Dritten steht eine Obduktion an.

In der Ukraine hat vor allen Dingen die saisonale Grippe Opfer gefordert.

315 Tote sollen es bis zum Dienstag sein.

1,3 Millionen Menschen haben sich nach Behörden- Berichten hiermit schon infiziert, aber nur 166 hiervon nachweislich mit der Schweinegrippe, wovon 15 nicht mehr leben.

THE FLU CASE

WHO maintains swine flu rampant while Polish Parliament told tiny number of cases

The Flu Case, 21 November 2009 13:01

https://web.archive.org/web/20100102011703/http://theflucase.com/index.php?option=com_content&view=article&id=2002%3Awho-maintains-swine-flu-rampant-while-polish-parliament-told-tiny-number-of-cases&catid=1%3Alatest-news&Itemid=64&lang=en

WHO is continuing its fear mongering, maintaning the swine flu has reached at least 206 countries and territories across the globe and killed more than 6770 people, still far less than the normal seasonal flu.

In its weekly update, WHO maintains swine flu widespread in Asia, USA, Canada and Europe and is continuing to increase.

Meanwhile, the Polish Parliament was recentlytold by health experts that only 193 people in the country who had come down with the flu were found to have actually had the swine flu.

In addtion, all of those people had a mild sickness. In the past few days, this number has increased but still remains under 300 cases of confirmed swine flu.

WHO's swine flu vaccine terrorism against people around the world, therefore, has no justification.

World Health Organization

Pandemic (H1N1) 2009 - update 75

Geneva, WHO, 20 November 2009.

https://web.archive.org/web/20091231141342/http://www.who.int/csr/don/2009_11_20a/en/index.html

Weekly update

20 November 2009 – As of 15 November 2009, worldwide more than 206 countries and overseas territories or communities have reported laboratory confirmed cases of pandemic influenza H1N1 2009, including over 6770 deaths.

As many countries have stopped counting individual cases, particularly of milder illness, the case count is likely to be significantly lower than the actual number of cases that have occurred. WHO is actively monitoring the progress of the pandemic through frequent consultations with the WHO Regional Offices and member states and through monitoring of multiple sources of data.

Nur in 293 von ihnen fand man das Virus H1N1, hiervon zeigten 10 Patienten schwere Symptome. 3 Menschen starben bisher in verschiedenen Teilen des Landes. Mindestens zwei der Todesopfer hatten auch andere Krankheiten, beim Dritten steht eine Obduktion an. In der Ukraine hat vor allen Dingen die saisonale Grippe Opfer gefordert. 315 Tote sollen es bis zum Dienstag sein. 1,3 Millionen Menschen haben sich nach Behörden-Berichten hiermit schon infiziert, aber nur 166 hiervon nachweislich mit der Schweinegrippe, wovon 15 nicht mehr leben.

Keine Mutation des H1N1-Virus in der Ukraine

Vorläufige Tests mit Proben von Patienten in der Ukraine zeigen, dass der H1N1-Virus, sich nicht wesentlich verändert hat und somit dessen Mutation so gut wie ausgeschlossen werden kann. In der Ukraine war zuerst der Verdacht aufgekommen, dass das Virus mutiert sein könnte. Die Test der Proben aus der Ukraine, wurden in Speziallabors in Großbritannien und den Vereinigten Staaten durchgeführt. Die Ergebnisse schließen derartige Bedenken aus. "Die Lungen von einigen der Opfer waren unnatürlich schwarz" - behaupteten damals einige Medien und versetzten erwartungsgemäß die Bevölkerung in Panik. Die WHO zeigt sich aber noch nicht so gazn zufrieden mit den Laborergebnissen aus London und Houston, man will weiter "analysieren".

Polen wollen keine Schweingrippe- Impfungen

In Warschau hat der Pandemie-Ausschuss unter Leitung der Ministerin Ewa Kopacz beschlossen, dass ein Vorrat von 80 Tausend Dosen Tamiflu den Apotheken überlassen werden soll, damit jeder Patient anhand des Beizettels selbst entscheiden kann, ob er die umstrittene Medizin nehmen will oder nicht. Es sollen keinerlei Impfmittel gegen die Schweinegrippe eingekauft werden, da die Situation im Lande diese nicht erfordere und die Meldungen über Todesfälle nach den Impfungen mit Pandemrix und Co. sich häufen würden. Für einen etwaigen Notfall, den man aber nach Lage der Dinge fast ausschliessen könne, will Kopacz die Verhandlungen mit den Herstellern von Anti- Virus Arzneien aber nicht abrechen. Angeschafft werden sollen allerdings mehr Mittel zur Impfung gegen die saisonale Grippe. Die Regierung wird hierzu Gelder bereitstellen. Es ist nicht ausgeschlossen, dass dieser neue Einfall dem Besuch von Vertretern der Pharma Industrie zu verdanken ist, die bis zum Wochenende noch in Warschau weilten.

Schweinegrippe - die freundlichere Winter- Variante

Wie "Polskaweb" bereits in den vergangenen Tagen deutlich zu machen versuchte rudern jetzt Medien, WHO, Gesundheitsministerien und Pharmakonzerne mit ihrer Panik- Strategie zur Schweinegrippe- A-H1N1 zurück. Die großen Gewinne sind eingefahren, jetzt heisst es "unverdienten" Rufschäden und Strafanzeigen entgegenzuwirken. In Europa sind es fast nur noch deutsche Medien wie z.B. Bild, Welt und Rheinische Post, die noch nicht gemerkt haben, dass die Leser anderer Zeitungen ihnen längst einen großen Schritt voraus sind. Die Schweinegrippe ist längst schon als weniger gefährlich bekannt, als die saisonale Grippe. Wer jetzt noch vor ihr Angst hat, der muss es also vor unserer herkömmlichen Grippe erst recht haben, da er bereits unter anderen Krankheiten leidet deren Wirkung durch einen Virus noch verstärkt wird.

Polskaweb NEWS

Polen bietet Schweinegrippe - Verfolgten Asyl an

PolskaWeb News, 22 November 2009

https://web.archive.org/web/20091121081636/http://polskaweb.eu/der-schweinegrippe-hysterie-entkommen-655846734443.html

Posen - Polen ist besorgt über die Opfer der Schweinegrippe Hysterie in Deutschland. Österreich und der Schweiz. Tagtäglich verfolgt man vor allen Dingen die Ereignisse beim deutschen Nachbarn, desse Fernsehprogramme auch in Danzig oder Breslau empfangen werden. Ein aufkommendes Mitleid mit den Menschen jenseits der Oder ist bereits unübersehbar. In diversen Interforen bieten bereits seit Tagen unzählige Polen den durch dubiose Medien, Instituten, Gesundheitsämtern, Politikern oder der Weltgesundheitsorganisation WHO Verfolgten und in die Enge getrieben ausländischen Nachbarn mehrwöchiges Asyl und gesunde Kost in Polen an. Unzählige Hotels im Lande haben sich inzwischen ebenso bereit erklärt, Deutsche, Österreicher und Schweizer Schweinegrippe Asylanten ohne sonderliche Formalitäten jederzeit aufzunehmen. Neben Schutz vor den Verfolgern beinhalten derartige Angebote auch umfangreiche Sicherheit vor der Schweinegrippe- Impfung und Massenpanik.

Polen bietet Rundumschutz

Ganz besonders erwähnenswert sind die Preise für Kost- und Logis der H1N1-Asylanten. Die meisten Hotels und Pensionen in Polen bieten derzeit schon saison- und bedarfsbedingt Rabatte von bis zu 60 Prozent für ihre Gäste an. Auch die Organisation von Shuttle- Services zu den umliegenden Apotheken zwecks Einkauf von sehr günstigen und sicheren polnischen Grippemitteln als Rundumschutz für die spätere Heimkehr, ist bei fast allen Quartieren im Preis mit einbegriffen. In Polen selbst reichen zum Schutze gegen die Schweinegrippe 3 Mahlzeiten täglich und für Erwachsene am Abend ein Gläschen polnischen Wodkas meist voll und ganz aus. Angesichts der bevorstehenden Weihnacht, empfiehlt sich natürlich auch ein Einkauf in Polen. Die großen Renner bei ausländische Touristen sind in diesem Zusammenhang jetzt Atemschutzmasken aus Engelshaar mit Sternchen und Tamiflu- Pillen aus Marzipan.

Panikmacher unerwünscht

Für abenteuerlustige Grippe- Asylanten bieten z.B gleich mehrere Hotels in Kolberg (Kolobrzeg) einen Ausflug zum einzigen Schweinegrippe- Kranken Polens ins 400 Kilometer entfernte Lublin an (Er darf angefasst werden). Vorzügliche Quartiere in Polen finden Sie in der Reisesparte von "Polskaweb" über Google und wenn Sie wollen sicherlich auch bei ihrem Reisebüro. Ausgenommen von diesem Asylprogramm sind sämtliche leitenden Mitarbeiter von Pharma Konzernen, der europäischen Gesundheitsbehörde EMEA, der WHO, dem Robert-Koch und Paul Ehrlich-Institut, Gesundheitsämtern, alle Gesundheitsminister inklusive Ulla Schmidt, Medien wie ARD, RTL, Bild Zeitung, die Welt, Rheinische Post, FAZ, Focus, die Zeit, Frankfurter Rundschau und etwa 1600 Ärzten, deren Namen wir an dieser Stelle nicht alle aufführen wollen, da sie meist bereits in einem anderen Bonusprogramm berücksichtigt wurden.

Glückseelige Insel Polen

Polen ist eine gesunde Insel, dagegen sieht es bei den direkten Nachbarn Deutschland und der Ukraine erstaunlicherweise, wenn man denn den Medien und Behörden glauben darf, nach Epidemien jeglicher Couleur aus. Die Geldgier der Pharma- Industrie und ihrer unzähligen kleinen und großen Helfer macht einfach alles möglich. Merken Sie eigentlich nicht dass man Sie zum Narren hält, betrügt und bestiehlt?

THE FLU CASE

Polish Health Minister enjoys international support for her stance on Swine Flu shot

The Flu Case, 23 November 2009, 12:28
http://antikorruption.ch/downloads/youtubeglobalcongratulations2ewakopaczandpolan.pdf (deleted)

The Polish Health Minister and family doctor, Ewa Kopacz, has become an international heroine after she publicly stated in Parliament, she would not buy the untested swine flu jabs for Poland unless the pharmaceutical companies producing them accepted liability.

One Youtube video of her speech in Polish has had more than 40,000 views in one week in spite of almost no coverage of her stance by the mainstream media.

Viewers from around the world have been showering her with praise for taking a strong stance against Big Pharma and the banksters.

Kopacz has received strong support from within Poland for stating that swine flu vaccines have not be adequately tested by the medical authorities and pose a risk to the people of Poland.

Furthermore, the Polish Parliament produced figures underlining that there is no swine flu pandemic with about 300 verified cases of people with the H1N1 virus.

One person posting from Sweden asked whether they could go to Poland as a refugee – a thought that has occurred to many others.

"Thank You very much for this!
Here in Sweden probably around 10 people have died from the vaccine, we don't know, media don't report anymore of the deaths, really scary. Could it be possible to come to Poland as a refugee ?" – writes one person.

REUTERS

Measures to fight H1N1 swine flu in Europe

Reuters, 24 November 2009, 11:41 PMU
https://www.reuters.com/article/uk-flu-measures-factbox-idUKTRE5AN3CR20091124

(Reuters) – Here are some details about measures taken to fight the H1N1 swine flu, a mixture of swine, bird and human viruses and which has killed more than 7,860 people globally, according to the latest European Centre for Disease prevention and Control (ECDC) tallies.

The World Health Organisation (WHO) declared an H1N1 pandemic on June 11, indicating the first influenza pandemic since 1968 was under way.

...

Poland

Health Minister Ewa Kopacz has said not enough tests have been conducted to ensure flu vaccinations are safe for people and that she is demanding more guarantees from pharmaceutical firms before any possible purchase.

– Several schools have been temporarily closed across the country, but there has been no central recommendation to do so.

PULS Medycyny

Ewa Szarkowska

Świńska grypa w Polsce

Puls Medycyny, 24 November 2009, 00:00
https://pulsmedycyny.pl/swinska-grypa-w-polsce-882972

Minister zdrowia zapewnia, że w Polsce nie ma epidemii grypy A/H1N1, a resort i służby sanitarne w pełni kontrolują sytuację. Wszystkie rezerwy leków antywirusowych trafią do aptek, natomiast lekarze otrzymają instrukcje, w jakich sytuacjach i w jakich dawkach je stosować.

Liczba osób w Polsce, u których potwierdzono przypadki grypy wywołanej wirusem A/H1N1, wciąż rośnie. Notowane są też kolejne zgony. Lekarze, którzy przeprowadzili sekcje zwłok, nie wiążą ich jednak bezpośrednio z A/H1N1. Jak poinformował główny inspektor sanitarny Andrzej Wojtyła, główną przyczyną zgonów są współistniejące choroby przewlekłe.

Według danych resortu zdrowia, od 1 września do 15 listopada na grypę sezonową oraz wywołaną wirusem A/H1N1 zachorowało w Polsce 107 250 osób; w ubiegłym roku w tym samym okresie zachorowało 24 843 pacjentów.

Gdzie są instrukcje i leki?

Obradujący 17 listopada Krajowy Komitet ds. Pandemii Grypy zdecydował o uruchomieniu zapasu 75-80 tys. dawek leków antywirusowych Tamiflu (Relenza pozostała dostępna jedynie w szpitalach) zgromadzonych w hurtowniach oraz wprowadzeniu ich do aptek szpitalnych i ogólnodostępnych, tak by lekarze mogli jak najszybciej wdrożyć leczenie antywirusowe.

Źródło: Puls Medycyny

Minister zdrowia i konsultant krajowy w dziedzinie chorób zakaźnych ogłosili instrukcję, w jakich sytuacjach i u których pacjentów powinno być wdrożone to leczenie. Resort zapewnia, że trafi ona zarówno do każdego lekarza rodzinnego, jak i do specjalistów.

"Lekarze otrzymają także informacje przypominające, w jakich dawkach stosować lek antywirusowy. U osób dorosłych i dzieci, ale ważących powyżej 40 kg, Tamiflu podaje się rano i wieczorem w kapsułkach 75 mg. Zgodnie z zaleceniami EMEA, u dzieci do 1. roku życia to lekarz decyduje, czy wdraża to leczenie, czy nie; instrukcja ułatwi mu obliczenie dawki w zależności od wagi i wieku dziecka" - wyjaśnia Ewa Kopacz. Dodaje, że lekarze otrzymają także wytyczne, jak przyrządzać zawiesinę, gdyby okazało się, że w aptece lek jest dostępny tylko w kapsułkach.

Resort zdrowia postanowił rozwiać wątpliwości lekarzy dotyczące sposobów podania niemowlętom i małym dzieciom kapsułek antywirusowego preparatu Tamiflu. Pytania pojawiły się po opublikowaniu przez ministerstwo zaleceń postępowania w zachorowaniach na grypę A/H1N1.

W łagodnym przebiegu grypy nie należy stosować aspiryny, wystarczy podstawowy zestaw leków obniżających gorączkę i zmniejszających bóle mięśniowego - takie zalecenia znalazły się w

podpisanej przez minister zdrowia i konsultanta krajowego w dziedzinie chorób zakaźnych informacji o tym, co lekarz powinien wiedzieć w związku z przypadkami grypy A/H1N1.

"Z naszych informacji wynika, że obecnie w hurtowniach są 32 tysiące dawek, a drugie tyle znajduje się w aptekach. W najbliższych dniach trafi do hurtowni kolejne 100 tysięcy dawek" - zapewnia Ewa Kopacz. Minister dodaje, że gdyby okazało się, iż zgromadzone w hurtowniach zapasy leków antywirusowych szybko się wyczerpują, do obrotu będzie systematycznie wprowadzany zapas Tamiflu zgromadzony w Agencji Rezerw Materiałowych. Stan tych rezerw jest tajny.

Sezonowa versus świńska

"W ostatnich dwóch tygodniach ukazały się dwie ważne publikacje w prestiżowych czasopismach na temat przeprowadzonych badań, z których wynika, że u osób po 50. roku życia mamy krzyżową odporność, a u osób młodych mamy część krzyżowej odporności. Szczepmy się więc przeciwko sezonowej grypie szczepionkami, które są dostępne na polskim rynku" - apeluje prof. Lidia Brydak, kierownik Krajowego Ośrodka ds. Grypy NIZP-PZH. Przypomina też, że od lat WHO rekomenduje wzrost wyszczepialności przeciwko grypie, ale w Polsce wciąż jest ona na skandalicznie niskim poziomie.

"WHO apeluje, a my robimy swoje. W sezonie 2008/2009 zaszczepiło się zaledwie 5,2 proc., czyli niewiele ponad dwa miliony Polaków. Nawet w przypadku osób po 64. roku życia, które mogą zaszczepić się za darmo, korzysta z takiej możliwości tylko 40 proc. Narzekamy, że nasze dzieci leżą na korytarzach oddziałów szpitalnych, kiedy następuje wzrost zachorowań na grypę i infekcje grypopodobne. Ale nie szczepimy tych dzieci. W grupie wiekowej od 6 miesięcy do 14 lat ich wyszczepialność w Polsce wynosi od 1,1 do 1,6 proc. Z przykrością muszę stwierdzić, że przeciwko grypie sezonowej szczepi się też bardzo mało pracowników służby zdrowia - zaledwie 6,6 proc." - podkreśla prof. Brydak. Przyznaje, że ma żal do lekarzy, którzy nie dość, że sami się nie szczepią, to odradzają to swoim pacjentom. Podkreśla, że jeśli lekarz ma wątpliwości, powinien zajrzeć do rekomendacji Światowej Organizacji Zdrowia, Komitetu Doradczego ds. Szczepień Ochronnych (ACIP) oraz Amerykańskiej Akademii Pediatrii.

Ewa Kopacz zapowiedziała, że będzie rekomendować premierowi zakup większej ilości szczepionki przeciwko grypie sezonowej. Przypomniała, że przed sezonem grypowym do polskich aptek trafiło ponad dwa miliony dawek. Teraz sprowadzono 40 tys., a lada dzień w ramach importu docelowego dotrze do Polski 273 tys. dawek przeznaczonych dla białego personelu.

Minister podtrzymuje swoje stanowisko, że Polska nie będzie działać zgodnie z zaleceniami WHO i nie zakupi szczepionki przeciwko grypie A/H1N1, dopóki producent nie weźmie na siebie odpowiedzialności za jej stosowanie. Odwlekanie decyzji w tej sprawie skrytykował ostro rzecznik praw obywatelskich Jan Kochanowski i zagroził, że złoży na Ewę Kopacz doniesienie do prokuratury. Teraz wszystko zależy od tego, czy do argumentów minister przekona go treść przekazanej mu dokumentacji negocjacji z firmami farmaceutycznymi.

Szczepionka powoduje alergię? Wycofują ją

WPost, 25 Listopada 2009, 15:47
https://www.wprost.pl/swiat/179757/szczepionka-powoduje-alergie-wycofuja-ja.html

Problem dotyczy 172 tys. szczepionek pochodzących z wadliwej partii dostarczonej do Kanady przez farmaceutyczną kompanię GlaxoSmithKline – informuje portal internetowy amerykańskiej telewizji foxnews.com.

Rewelacje ogłoszone zostały we wtorek. Rzeczniczka firmy Gwenan White zaleciła personelowi medycznemu w Kanadzie zaprzestać używania szczepionek pochodzących z wadliwej partii. Istnieje ryzyko, że szczepionki tę mogą powodować reakcje alergiczne częściej niż dzieje się to normalnie. Gweanan White odmówiła odpowiedzi na pytanie, ile spośród wadliwych szczepionek zostało zaaplikowanych pacjentom w Kanadzie, gdzie wykorzystano ich w sumie aż 7.5 mln.

A/H1N1 w Polsce

Wirus świńskiej grypy zadomowił się również w Polsce. Od 1 września do 15 listopada na grypę sezonową i wywołaną wirusem A/H1N1 zachorowało 107 250 osób, w tym do tej pory na A/H1N1 zmarło już 15 osób. Minister zdrowia Ewa Kopacz podkreśla, że znacznie groźniejsza od nowego wirusa jest grypa sezonowa, a resort zdrowia wciąż nie zdecydował się zakupić szczepionki na świńska grypę, ponieważ, jak tłumaczy Ewa Kopacz, żadna z firm farmaceutycznych nie spełniła podstawowego wymogu: wzięcia odpowiedzialności za ewentualne skutki uboczne po szczepionce. Jednak, jak poinformowała, trwają rozmowy z pięcioma firmami, w tym dwie z nich mają już ukończone badania kliniczne nad nową szczepionką. *Ostateczną decyzję jednak, uzależnia od wyników badań ujawniających skuteczność ich stosowania*.

MOLDOVA.ORG

Swine flu vaccine's safety: Polish Minister of Health's speech

MOLDOVA.org, 27 November 2009.
https://www.moldova.org/en/swine-flu-vaccines-safety-polish-minister-of-healths-speech-204619-eng/

Polish Health Minister, Mrs. Ewa Kopacz, gives speech in the Polish Parliament on serious issues with swine flu vaccine's safety and why the Polish government is rejecting the vaccines (5 November 2009).

In addition, on Nov. 3, Minister Ewa Kopacz said at a press conference (transmitted by Polish television channel TVN24) that the government will reject mass "swine flu" vacccination for its population because of safety concerns over the jab.

Kopacz said that the government would base its decision to use the swine flu vaccine based on the data from reliable clinical trials, but that there were no such reliable data for the swine flu jabs.

"We will not order any AH1N1 vaccines unless there is full evidence they are completely safe," she said.

'Each government is responsible for the welfare and health of its citizens, for recommending them health and safe medicines. So far, on any stage, no company we are negotiating with has been able to provide us with the most important thing for us – the evidence of jabs' safety and that it will not have possible side effects," she said.

'I will not work under pressure! We will not order any AH1N1 vaccines unless there is full evidence they are completely safe," Ewa Kopacz said.

Ewa Kopacz also said that the ordinary, seasonal flu is much more dangerous than 'swine flu'.

This is a word for word translation of a 39 second segment of the press conference:
"Let's not worry about whether [the swine flu vaccine] will reach Poland. The problem is something else: when it gets here, [the vaccine] must be safe. It's not going to be a case of "we don't know for sure it is safe, but let's buy some for the risk groups anyway". Nobody will talk me into this. If we do [buy the swine flu vaccine], it should be safe so that it can be recommended looking Poles straight in the eye, and especially to those who are going to have the maximum contact with sick patients – first of all the white coats, who have to have the guarantee that the vaccine is a prophylactic measure, not a placebo, not something that might cause some adverse effects in the future, but a vaccine that will give them immunity, so please give us a little bit of time.," she said.

THE FLU CASE

Outbreak of severe Flu in Eastern Poland connected to Night Flights?

The Flu Case, 30 November 2009, 12:56

https://web.archive.org/web/20100102030613/http://theflucase.com/index.php?option=com_content&view=article&id=2125%3Aoutbreak-of-severe-flu-in-eastern-poland-connected-to-night-flights&catid=1%3Alatest-news&Itemid=64&lang=en

An oubreak of severe swine flu has been reported in Pomerania, Poland, not long after many people heard the sound of unusual low flying aircraft at night time in the region, sparking speculation about whether there is a connection between the flu outbreak and the planes as was reported in the Ukraine a few weeks earlier.

Similar reports of low flying, rumbling planes at night have been made recently in Austria too.

Attempts to identify the planes using flight records or radar records have so far failed to turn up information.

Now, some one in Poland has proposed that the night planes were Antonovs made from cardwood and gum with some key parts made from aluminium and plastic, making them invisible to radars flying at 60 meters to 180 meters, depending on the radar system used.

The only parts of the plane that are metal appear to be the engine, propellers and steering components (?). These large transport planes can be hired for as little as 1000 dollars on the black market but use a lot of fuel, according to the source.

Such planes could theoretically be used to implement the spraying of an area with a biological agent.

Schweinegrippe - Polen verteidigt Bedenken in Brüssel

PolskaWeb News, 5 December 2009
https://web.archive.org/web/20091205083033/http://polskaweb.eu/schweinegrippe-impfung-sinnlos-und-wahrscheinlich-gefaehrlich-6578673665.html

Brüssel - Beim gestrigen Treffen der EU- Gesundheitsminister in Brüssel befand sich natürlich das Thema Influenza A/H1N1 ganz oben auf der Tagesordnung. Die polnische Gesundheitsministerin Ewa Kopacz stand bis zu diesem Zeitpunkt unter ihren Kollegen und Kolleginnen in ihrer Abwehrhaltung gegen alle bekannten Impfstoffe gegen die Schweinegrippe, zumindest offiziell, ganz alleine da. Nun verteidigte sie auch hier ihre Position, warnte vor den Impfstoffen und gab an, dass selbst wenn man über ihrem Kopf hinweg derartige Produkte in Polen offiziell bestelle und zum Einsatz bringe, würde sie keinerlei Verantwortung hierfür übernehme. "Ich werde meine Strategie nicht ändern, wofür ich allerdings die volle Verantwortung übernehmen werde. Ich stehe seit langer Zeit unter einem enormen externen Druck, der Zwang auf mich ausüben soll bestimmte Entscheidungen zu treffen, kann diesem aber aus gutem Gewissen nicht nachgeben" – sagte die Ministerien in Brüssel und erhielt nach ihrer Vortrag sogar Beifall, wenn auch nur von einigen wenigen Kollegen.

Fast alle Toten hatten Vorerkrankungen

"Wir hatten in fast 7 Monaten Schweinegrippe- Hysterie nicht einen einzigen Toten zu verzeichnen, der mit dem H1N1- Virus in Verbindung gebracht werden konnte. Jetzt starben in den letzten drei Wochen 24 Menschen die das angebliche tödliche Virus im Blut hatten. 1158 Polen wurden bis bisher hierdurch infiziert, nur eine Handvoll dieser Patienten befindet sich noch in Krankenhäusern und dies meist, weil sie neben der "Schweinegrippe" noch andere chronische Leiden mit sich rumschleppten. Dies betraf auch fast alle Toten. Sie hatten diverse Vorerkrankungen, hierunter auch Krebs und HIV und Nierenerkrankungen" - sagte Kopacz und bestätigte auch, dass 80% der A/H1N1- Erkrankten wesentlich weniger leiden als Patienten mit der normalen Grippe.

Kopacz fordert Ende der Pandemie

Gesundheitsministerin Kopacz zeigte sich in Brüssel zudem überzeugt davon, dass sie mit der polnischen Position nicht isoliert sei und man nun endlich "Vernunft" demonstriere, indem man ein Ende der Schweinegrippe- Pandemie ausrufe. Vernunft und Solidarität mit ihrer Ministerin zeigen aber leider nicht alle Polen. Ausgerechnet der Bürgerbeauftrage des Landes, Janusz Kochanowski, hatte nämlich Frau Kopacz am Dienstag bei der Nationalen- Staatsanwaltschaft in Warschau angezeigt. Nach seiner Meinung hat sich strafbar gemacht, weil sie keine Mittel zum Kampf gegen die "Seuche" bestellt habe und somit das Leben und die Gesundheit der Polen aufs Spiel setze. Die Gesundheitsministerin reagierte auf eine diesbezügliche Information mit einem Achselzucken und sagte, dass sich gerade ihre Strategie dem Leben und die Gesundheit ihrer Landleute zuwende, deshalb empfehle sie weiterhin Tee mit Himbeersaft.

Medien haben A-H1N1 gefährlich gemacht

Nach den Daten des Nationalen Institutes für Gesundheit und Hygiene in Warschau ist die "neue" Grippe inzwischen für 30-50% der Fälle von Influenza in Polen verantwortlich. Chef Inspektor Bondar: "Erfreulichweise ist die neue Grippe meist so mild, dass kaum noch jemand zum Arzt geht. Hierfür ist aber auch die ehrliche und soziale Berichterstattung unserer Medien zu erwähnen, die anders als die Auslandspresse, alles andere tun als Panik zu erzeugen. Das neue Grippe- Virus ist dominant aber wesentlich weniger gefährlich als die bisher bekannten Viren, einschliesslich den Auslösern der saisonalen Grippen. 24 Tote hatten wir bisher, die an der neuen Grippe erkrankt waren,

doch die meisten hatten schon Vorerkrankungen und in den vorangegangen Grippeperioden hatten wir im gleichen Zeitraum manchmal sogar mehrere hundert Tote. Was heutzutage schlimmer ist, ist nur die Berichterstattung zu einer Grippe wie jetzt zur Influenza A-H1N1" - bekräftigte Bondar.

Impfstoffe unter der Lupe der Staatsanwaltschaft

In vielen Ländern wo Impfungen gegen die Schweinegrippe durchgeführt wurden starben Patienten Stunden oder wenige Tage nach diesen Maßnahmen. In Deutschland schliessen staatliche Institutionen einen Zusammenhang mit den Impfmitteln wie z.B. Pandemrix aus. In anderen Ländern wie z.B. Italien untersuchen bereits Staatsanwälte derartige dubiose Todesfälle. Im süditalienischen Salerno leitete sie z.B. eine Untersuchung gegen zwei Novartis Manager und 14 Ärzte ein, die beschuldigt werden, für den Tod eines Mannes verantwortlich zu sein, der direkt und unmittelbar nach einer Impfung mit dem Schweizer Produkt "Celtura" an Herzversagen starb. Einen ähnlichen Tod fand auch ein zwanzigjähriger Mann aus Slowenien. Auch hier untersuchen Justizbehörden Klagen über die Qualität des Impfstoffes, wobei es in diesem Falle nicht "Celtura", sondern "Pandemrix" von GlaxoSmithKline den Tod des Patienten hervorgerufen haben soll.

Franzosen verkaufen weiter bedenkliche Impfstoffe

Trotz aller Entwarnungen im Zusammenhang mit der sog. Schweinegrippe hat es der französische Pharmakonzern Sanofi-Aventis noch geschafft der Slowakei 5,4 Millionen Dosen A/H1N1- Impfstoff zum Vorzugspreis "anzudrehen". Ein entsprechender Vertrag soll laut Informationen aus Bratislava (Lenka Szramkova Public Office) bereits am Montag gemacht worden sein. Der Preis für eine Dosis beträgt demnach 7,60 Euro. Bisher waren in der Sowakei in 7 Monaten nur 633 Personen mit dem A/H1N1 infziert, vier hiervon starben (Vorerkrankungen). Auf der anderen Seite sitzt z.B. Deutschland trotz aller Panikmache nun auf mehr als 90 % der bestellten und bezahlten Impfmittel von GlaxoSmithKline, denn kaum einer will sich noch impfen lassen, da die meisten Deutschen den Betrug mit der Schweinegrippe, die nichts anderes ist als unsere saisonale Grippe in abgeschwächter Form, durchschaut haben und kaum jemand wirklich krank ist. Nun versucht man offenbar zumindest den noch nicht ausgelieferten Impfstoff wieder abzubestellen, doch darauf wird sich der britische Hersteller nicht einlassen, da man ja wahrscheinlich schon mit großen Summen (Schmiergelder etc.) in Vorlage getreten war.

Österreichischer Gesundheitsminister fordert Überprüfung von "WHO- Regime"

Die Weltgesundheitsorganisation WHO kündigte im Juni diesen Jahres die sechste und höchste Pandemiestufe wegen einer angeblich weltweiten Schweinegrippen Epidemie an. Völlig kopf- und hilflos denkt man da einmal zuerst, doch es ist inzwischen immer deutlicher zu erkennen, dass dies auf "Anweisung" der Pharma- Industrie und deren in der WHO vertretenen "Strohmänner" stehen muss. Auch der österreichische Gesundheitsminister Alois Stöger hat jetzt in Brüssel, nach seiner polnischen Kollegin Kopacz, die Pandemie-Warnung der(WHO) wegen der neuen Grippe A/H1N1 infrage gestellt und forderte eine Überprüfung des "Genfer WHO Regimes". Er bezweifelte in diesem Zusammenhang dass die Regel der Weltorganisation richtig gewesen sei, bei derartig leichten Verläufen der Krankheit eine Pandemie auszurufen.

Nicht aufregen, Schweinegrippe nur Betrug ...

Wer jetzt noch zum Impfen gegen die Schweinegrippe rät, kann nicht seriös sein und es gut mit Ihnen meinen. Denn es ist doch nun wirklich nicht mehr zu übersehen, dass es gar keine Schweinegrippe gibt oder gab. Die Übertragung von Krankheiten von Tier zu Mensch sind relativ selten oder gibt es vielleicht garnicht. Wir haben es also nach wie vor nur mit unserer saisonalen Grippe zu tun, die mal so oder auch mal so heissen kann, je nachdem in welcher Zusammensetzung sie gerade einmal auftrat. Doch Betrüger haben erkannt, dass mit der Angst der Menschen Milliarden verdient werden können. Es gibt viele dubiose Gestalten im Zusammenhang mit angeblichen gefährlichen Krankheiten wie Vogel, Schweinegrippe, Sars usw. Einer der besonders verdächtig in diesem Zusammenhang scheint ist der holländische Tierarzt Albert Osterhaus, der seit Jahren vor immer neuen tödlichen Viren warnt, welche die Menschheit auslöschen könnten und zuerst von Tier zu Tier und dann von Tier zum Mensch übertragen werden. Tierarzt Osterhaus ist eine Schlüsselgestalt bei der WHO, steht aber gleichzeitig auf den Gehaltlisten der Pharma- Produzenten.

THE FLU CASE

Polish Health Minister calls for "Pandemic" to be Declared Ended

The Flu Case, 5 December 2009, 15:29

https://web.archive.org/web/20100102053002/http://theflucase.com/index.php?option=com_content&view=article&id=2192%3Apolish-health-minister-calls-for-qpandemicq-to-be-declared-ended&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"I will not change my strategy, for which I will, however, take the full responsibility. I have taken this position for a long time under an enormous external pressure, and felt compelled to make certain decisions. But I cannot with good conscience give way," she said to applause from some of her colleagues.

We did not have a single death in [Poland] in nearly 7 months swine flu hysteria which could be attributed to the H1N1 virus," she said.

"Now 24 people have allegedly died from the virus in the blood in the last three weeks."

"1158 people in Poland have so far been infected and only a handful of these patients are sill in hospitals and most of these because they were suffering from other chronic diseases as well as having the swine flu virus."

"This is true of nearly all the people who died. They had various underlying sicknesses, including cancer and HIV and kidney illnesses," Kopacz said.

She noted that 80% of the people with the swine flu suffered milder symptoms than people with the normal flu.

Kopacz also called for an end to the swine flu pandemic level 6 declaration and a return to reason.

Kopacz has in the meantime been attacked by Janusz Kochanowski, national ombudsmen, who filed charges on Tuesday in Warsaw against her for not failing to address a pandemic in a move that is bound to raise speculation as to whether he has financial links to the pharma cartel that profits from promoting the idea there is a pandemic when there is verifiably no pandemic.

Even the Austrian Health Minister Alois Stöger has admitted there is no swine flu pandemic and called for WHO to "reevaluate the pandemic level 6" declaration.

Stöger has come under fire in Austria for wasting huge amounts of public funds in purchasing the untested and toxic swine flu jab from Baxter, a jab which the general public has refused to take.

Criminal charges should be filed against Kochanowski for abusing his position and endangering the lives of the Polish people by pressuring the Health Minister to buy the swine flu jabs for the profits of the pharma companies.

The Polish media also received praise from officials for "honest" reporting of the facts that there is no pandemic threat in contrast to the foreign press which has been spreading panic so helping big pharma to massive profits.

Poland's internal swine flu fight

The World, 6 December 2009, 8:38 AM EST
https://theworld.org/stories/2009-12-06/polands-internal-swine-flu-fight
https://theworld.org/stories/2017/03/10/polands-internal-swine-flu-fight

Warsaw, Poland – Poland is standing alone against the swine flu, as one of the only European Union member states to refuse to place orders for the H1N1 virus vaccine because of the health minister's concerns about its safety.

But now the country's human rights ombudsman is threatening the health minister, Ewa Kopacz, with prosecution unless she moves on the vaccine.

Kopacz, who is also a doctor, is worried about the vaccine and is refusing to act until the pharmaceutical companies making the vaccine accept responsibility for any side effects, something they have been excused from by the World Health Organization's declaration of a pandemic.

"If I had a 100 percent certainty that the vaccine was a panacea for the swine flu, I would certainly buy it," Kopacz said in an interview with radio station Tok FM, adding that she felt drug companies were "covering up" some information about the vaccines.

"I feel that the research on the vaccines lasted too short a time," she said.

Kopacz's stand is very different from most of her European counterparts. Mass vaccination programs have begun in France, Germany and Scandinavia, as well as in central European countries like Hungary.

Her position has put her at odds with Janusz Kochanowski, who heads Poland's human rights office, and worries that Poland is completely unprepared for dealing with a potential swine flu epidemic. He is toying with the idea of filing charges against Kopacz.

"What is the ombudsman supposed to do when he is powerless and ignored?" Kochanowski asked in a Tok FM interview. "I wake up with this issue and go to sleep with it, because my back is up against the wall and I don't see any other answer."

Despite Kopacz' medical background, there are concerns that she is taking a potential risk if the current influenza season gets much worse. Kochanowski has said that he doesn't know how many people's deaths Kopacz will have on her conscience. He has called on Poles to inoculate themselves in other European countries where the vaccination is available.

A deputy health minister, in turn, has threatened to refer Kochanowski to the prosecutor's office for complicating the ministry's work.

As of Saturday, health authorities have said that 38 people have died in Poland from the swine flu and about 750 have been infected. However, the true level of infections is impossible to determine, both because people with milder cases tend not to report them, and because Poland has very few tests to confirm the presence of the H1N1 virus. Most of the tests have to be performed in neighboring Germany.

As well as lacking tests, the Polish health care system also needs more equipment like artificial lungs, to keep patients with severe influenza cases breathing.

The Polish media has been consumed with the swine flu story, reporting every death and serious case. So far there has been no panic like in neighboring Ukraine, where the country was paralyzed with fear a couple of weeks ago, with schools being shut down and thousands donning generally ineffective face masks to protect themselves against the virus.

Although there is something of the hypochondriac in the Polish character – garlic cures and energy treatments are popular – it is more than balanced by a conspiratorial worldview which would subscribe to the idea of pharmaceutical companies keeping knowledge of the side effects of vaccines to themselves, as well as a suspicion of bureaucracy, including the health ministry.

But if the disease takes a turn for the worse, then Kopacz's stand could have political ramifications. She is a minister in the center-right government of Donald Tusk, and Kochanowski is a political ally of Lech Kaczynski, Poland's right-wing president and Tusk's likely rival in next year's presidential elections.

On his web page, Kochanowski's office has a note for every patient killed by the swine flu virus.

THE FLU CASE

Polish Prime Minister criticises pharma and climate lobby

The Flu Case, 14 December 2009, 14:14

https://web.archive.org/web/20100102035052/http://theflucase.com/index.php?option=com_content&view=article&id=2286%3Apolish-prime-minister-criticises-pharma-and-climate-lobby&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Polish Prime Minister Donald Tusk received a standing ovation for a speech at the Congress of European People's Parties in Bonn -- attended by German Chancellor Angela Merkel – in which he said that the swine flu pandemic and the phenomena of global warming are artifical crises that have been created for the profit of corporations, according to Polskaweb.

Tusk said ethical standards and a sense of fairness need to be restored in the EU also in connection with the bank-engineered credit crunch, which has seen governments giving trillions in bank bailouts to banks, thereby putting states on the verge of bankruptcy and burdening tax payers with gigantic debts.

"If we use our reason and conscience we will be able to protect our environment and climate without having to serve the egotistical interests of the business sector or of the eco lobby in some countries," Tusk said.

"If we want to protect people from sicknesses, we have to stand on the side of the people and not represent big pharmaceutical companies and their interests. It looks today like there is more interest in pouring oil onto the fire of a flu pandemic of greed and hypocrisy and on the phenomen of global warming than in getting a grip on selfishness," he said.

In another report, Polskaweb discusses the many scandals involving gigantic bribes, kickbacks and secret bank accounts that have rocked German political figures and parties, and also corporations.

Neither Germany's media nor justice system seems, however, inclined to investigate the vast pools of money transferred onto secret bank accounts that could be the reason why the German health minister, chancellor, leading doctors and also key officals at the Paul Ehrlich and Robert Koch Institute are so eager to trumpet the untested swine flu jab.

But it is not just the German government that appears to be so vulnerable to bribery and blackmail, and so willing to sell out the interests of their people for a few 100 million euros deposited on an offshore bank account.

Members of the Dutch, Danish, French, UK and US governments are among the biggest promoters of the swine flu and climate warming money-making scams.

Are only leaders in the entire Western world whose leaders cannot be bought in Poland? It certainly looks like this is the only honest government left in Europe and the USA.

Poland's health minister and a family doctor Ewa Kopacz recently came under fire from big pharma and WHO for refusing to order the untested swine flu vaccine for which the pharmaceutical companies want blanket immunity.

"Tomasz Lis live" 23 November 2009 http://www.youtube.com/watch?v=GnZolcdog4A (*video deleted*)
Biggest politics TV show in Poland, around 3 million viewers.
Polish Vice-Health Minister ask reasonable questions about WHO, pharmaceutical companies, pandemic announcement, etc. This is more like the Minister talking rather than the debate and I didn't balance this video on purpose for a few reasons:

1) There's enough of other view in media all around the world.
2) I titled this "Minister talking on AH1N1" rather than "talk" or "debate". The arguments of the other guy were as usual, at least here in Poland:
a) We got kicked out of the queue for the vaccine because of our Health Ministry's doubts. This is rubbish since many countries are willing to sell some of their vaccines since not much people want to take shots.
b) Another argument is that EMEA and WHO recommended the vaccine so *it just must be good* for us and anyone who says otherwise *is mad conspiration theorist*. No comment on this one.
c) The last argument: OK, *no pandemic at the moment* but *we don't know* what will happen in the next few months. Well Health authorities said clearly that not much really will happen, plus it looks like they would exchange this new flu for the seasonal one since AH1N1 is much milder and easier to go through without complications than regular seasonal flu. Hope this makes sense :) We're one! (this is actually scientifically proven now, search YT for Nassim Haramein or Gregg Braden)

Poland is the only country known to have refused H1N1 swine flu vaccines due to safety concerns

Daily News / The Associated Press, 13 January 2010
https://www.nydailynews.com/life-style/health/poland-country-refused-h1n1-swine-flu-vaccines-due-safety-concerns-article-1.458157

WARSAW, Poland - The decision seemed fraught with risk: a government refusing to import swine flu vaccines amid worldwide warnings of a spreading epidemic.

But Poland did just that, becoming the only country worldwide known to reject the vaccines over safety fears and distrust in the drug companies producing them - concerns international health experts reject as unfounded.

Now that the current outbreak appears to have peaked in much of Europe, many Poles feel their government has been vindicated: Countries with large stockpiles often saw low public interest in the vaccines and face financial loss from unused doses now set to expire. But Poland's government didn't spend a cent fighting the epidemic.

All along, the decision by Prime Minister Donald Tusk and Health Minister Ewa Kopacz met with broad support. Even with 145 swine flu deaths in Poland to date, many Poles view the rejection of the vaccines as a laudable gesture of defiance against pharmaceutical companies, sentiment shaped by a strengthening anti-vaccine movement and conspiracy theories about the vaccines circulating on the Internet.

"I had the impression that the information about swine flu was manipulated in order to create a panic," said Barbara Lazniewska, a 38-year-old architect who was among the many Poles to applaud the government's stance.

Poles take pride in having a strong independent streak and many respect the government for defying the EU, the World Health Organization and other international groups that urged countries to implement vaccination programs - advice that smacked to some of meddling in internal affairs.

The prime minister described Poland as a country with the rare "courage" to refuse a vaccine that he believes has not undergone sufficient testing.

"We are making this decision only in the interest of the Polish patient and the taxpayer," Tusk insisted in December. "We will not take part because it's not honest and it's not safe for the patient."

The anti-vaccine movement argues it is untested or contains risky ingredients, like the preservative thimerosal. However, there is little difference in the swine flu vaccine's formulation from the regular flu vaccine, which is available in Poland, and all evidence so far suggests it is safe and effective. The WHO says more than 150 million people have been vaccinated in more than 40 countries and that no unusual or dangerous side effects have been seen.

"The saving grace for Poland is that this swine flu pandemic is so far very mild. It would be a big scandal if this were a virus that would cause many deaths," said Andrew McMichael, an immunologist and the director of the Weatherall Institute of Molecular Medicine at Oxford.

Other conspiracy theories claim the drug companies making the vaccine secretly lobbied the WHO to declare swine flu a global epidemic to fatten their own pockets, a theory unproven but

which some Europeans seem inclined to believe. Even the Parliamentary Assembly of the Council of Europe recently recommended that the EU investigate WHO's swine flu pandemic declaration to see if the body acted under undue influence.

In an e-mailed statement, WHO said its members "guard against the influence of any vested interests" but declined any other comment on the allegations, saying the group's flu chief, Dr. Keiji Fukuda, will address them during a news conference Thursday.

WHO spokeswoman Karen Mah said the organization has no reports of other countries rejecting the vaccine outright. Some countries, however, haven't launched vaccine programs because they lack the money.

Poland's approach contrasts sharply with steps taken by countries such as the United States – where President Barack Obama and his family got swine flu shots to set an example – and European countries like Austria and Sweden that stockpiled enough for their entire populations.

Other eastern EU members have also embraced inoculation, with Hungary and Romania even producing their own domestic vaccines against H1N1, the official name of the current swine flu strain. Romania has seen a burst of interest in vaccines in recent days following the death from swine flu of a well known TV actor, 37-year-old Toni Tecuceanu, on Jan. 5. Over the weekend, 13,000 people got vaccinated in Bucharest alone, the Health Ministry said Monday – vastly more than previous weekends that saw a few dozen at most ask for the jab.

But no well-known Pole has died, and flu fears failed to take root in the country of 38 million people.

Only one leading official, Janusz Kochanowski, the ombudsman for civil rights, has waged a prominent public fight against the government over vaccines, condemning its stance as irrational and irresponsible. He vowed to sue the health minister for a symbolic 1 zloty (35 U.S. cents/25 euro cents) for what he describes as a human rights offense: unnecessarily risking the health of the population by refusing to make vaccines available or take any other steps to fight the spread of swine flu.

Kochanowski came down with swine flu himself over the Christmas holidays, a turn of bad luck he viewed as deeply ironic. During a recent interview in his office he sneezed into a tissue from time to time, and his voice was raspy as he strongly denounced the government.

"In a normal country the media would attack a government that doesn't want to buy vaccines and which doesn't give citizens the right to choose. It's a basic right," Kochanowski told The Associated Press. "The constitution obliges the government to counteract and prevent epidemics. But rather than attacking the government, the media are attacking me."

Though there have been no recent opinion surveys on the matter, Kochanowski and several doctors say there is abundant anecdotal evidence showing that most Poles support the government's approach.

"Unfortunately most people are on the side of the government," Kochanowski said.

Kochanowski says he worries that the government's luck in dodging massive problems with swine flu will only encourage it to ignore future epidemics as well.

"This flu will pass, but there is a new flu every year and the government should prepare every year. However, this government is not only not preparing, but it's making a special point of not being prepared and then claims glory," he said.

In Poland, doctors are deeply divided on the matter, but some are clearly critical of the government.

"It should be the patient's rights to choose - that would be democracy in health care," said Maria Ciesielska, a family doctor whose disapproval only intensified when her 7-year-old son was laid up for a week with swine flu in November. "Even Hippocrates said it's not ethical to not offer a cure if you know that one exists."

Польша единственная отказалась от импорта вакцин против гриппа A/H1N1

Фармацевтический вестник, 14 января 2010, 00:00
https://pharmvestnik.ru/content/news/17506.html

Решение об отказе от импорта вакцины на фоне предупреждений о распространении вируса кажется весьма странным. Но польское правительство поступило именно так, и Польша стала единственной страной в своем роде.

Как объяснили власти, подобное решение принято из-за сомнений в безопасности вакцин и недоверия к производящим их фармацевтическим компаниям, в чем их стараются переубедить международные эксперты.

Как бы то ни было, премьер-министр Польши Дональд Туск и министр здравоохранения страны Ева Копач получили широкую поддержку населения. Даже несмотря на то, что грипп A/H1N1 унес жизни 145 человек, многие поляки рассматривают отказ от вакцин как вызов фармацевтическим компаниям, которые, по их мнению, продают неапробированные вакцины.

Кроме того, в стране проходит массовая кампания против вакцинации. Как заявил премьер-министр, Польша проявила мужество, отказавшись от вакцин, которые, по его мнению, не прошли соответствующие испытания. «Мы приняли это решение исключительно в интересах пациентов и налогоплательщиков», - сказал он.

Из официальных лиц против действий правительства выступил только омбудсмен Януш Кочановски. Мнения врачей разделились, некоторые из них критикуют решение об отказе от закупки вакцин. «У пациента должно быть право выбора», – заявил один из врачей.

Brawo Polska, Brawo Kopacz
Das polnische "H1N1 - Wunder" vor dem Europarat

Gazeta Pl., 10 March 10, 06:18
https://forum.gazeta.pl/forum/w,34281,108479487,108479487,Brawo_Polska_Brawo_Kopacz.html

Ta kobieta trzeba chwolic, ona sie nia dala zgupic, czytej nie obsluzyla klientela tak jak nasze skorumpowani abgeordnete:

Brüssel - Die Nutzniesser von dubiosen Krankheiten der vergangenen Jahre wie Sars, Schweine- und Vogelgrippe geraten immer mehr unter Druck. Nachdem sich am Dienstag in Brüssel zahlreiche Parlamentarier für eine tiefere Untersuchung der finanziellen Hintergründe sog. neuer Grippen einsetzten, bekam auch die polnische Gesundheitsministerin Ewa Kopacz eine Einladung von der Parlamentarischen Versammlung des Europarates in Sachen der zuletzt aufgetretenen Schweinegrippe, die in Europa und der Welt nur wenig Schaden anrichtete, dafür aber umso mehr Steuergelder gekostet hatte. Kopacz soll vor dem Ausschuss dazu Stellung nehmen, in welcher Form die WHO und Pharma Produzenten versucht hatten Druck auf Polen auszuüben, nachdem man sich geweigert hatte, unerforschte Impfstoffe ohne Hersteller-Garantie zur Impfung der Bevölkerung zu bestellen. Der Untersuchungsausschuss des Europarates wird vom deutschen Epidemiologen Dr. Wolfgang Wodarg geleitet, der weltweit als einer der ersten Köpfe war, den Filz aus WHO, Wissenschaftlern und der Pharma- Industrie bemerkt und kritisiert hatte.

"Polskaweb" hatte während der geschürten Schweinegrippe Paniken in Deutschland und der Ukraine die Welt darauf aufmerksam gemacht, dass die Polen mittendrin sich über die Hysterien bei den Nachbarn wunderten, da bis dahin im eigenen Lande so gut wie niemand an A-H1N1 erkrankt oder gar gestorben war. Erst nachdem die Pharma- Industrie an Gesundheitsministerin Kopacz zu scheitern drohte, meldete man die ersten mutmaßlichen Schweinegrippe- Toten auch in Polen, die allerdings alle auch andere Krankheiten hatten. Der britische Abgeordnete Paul Flynn sagte am Dienstag der Brüsseler Korrespondentin des polnischen Radios "RMF FM": "Wir haben eine sehr interessante Analyse, demnach starben in Polen etwa so viele Menschen an der Schweinegrippe wie in Großbritannien. London kaufte Impfstoffe um damit die ganze Bevölkerung zu immunisieren, Warschau hat nicht einmal eine einzige Dose abgenommen".

Ähnlich wie Flynn äusserte sich auch die französische Europaparlamentarierin Michele Rivasi: "Inmitten der Finanzkrise haben EU- Regierungen Milliarden für Impfstoffe nach einem Fehlalarm ausgegeben. Die französische Regierung hatte mehr als 90 Millionen Dosen des Impfstoffs gekauft, weil Experten rieten allen in Frage kommenden Franzosen zwei Schüsse zu injizieren. Tatsächlich verwendete man aber nur einen kleinen Teil und sucht nun wie Resteuropa nach Käufern für die überflüssigen Impfstoffe. Eine Milliarde Euro Steuergelder wurden somit in den Sand gesetzt. In Polen starben weniger Menschen an der Grippe als in Frankreich und es gab mindestens 3000 Fälle von Nebenwirkungen der Impfungen. Zudem sind zahlreiche Menschen als "Versuchskaninchen" für unzureichend getestete Impfstoffe mißbraucht worden". Rivas forderte einen Untersuchungsausschuss, der ermitteln soll ob "Interessenskonflikte" zu der falschen Pandemie-Warnung geführt haben. Dazu sollten mögliche Verbindungen der von der EU angehörten Experten zur Pharma-Industrie, durchleuchtet werden.

Die niederländische EU- Abgeordnete Judith Merkies bringt die Masche der Nutzniesser fauler Grippen auf den Punkt: "Alle zwei oder drei Jahre löst eine neue Krankheit Panik- Wellen aus. Im vergangenen Jahr war es die H1N1-Grippe, davor die Vogelgrippe und das Sars-Virus. Bemerkenswert wie in diesem Zusammenhang dann plötzlich die pharmazeutischen Industrie Druck auf die Länder ausübt, damit sie Impfstoffe kaufen. In den Niederlanden liegen 19 Millionen Impfungen nutzlos herum. Die Regierung hat hierfür 300 Millionen Euro bezahlt." Eine der ersten Parlamentarier welcher die Petition zur Einrichtung eines Untersuchungsausschusses zur Schweinegrippe unterschrieb, war der polnische Abgeordnete Boguslaw Sonic von der Tusk- Partei, der auch Ewa Kopacz angehört: " Die polnischen Behörden hatten im Zusammenhang mit den angeboteten Impfstoffen Zurückhaltung gepflegt und verlangten genauere Informationen von Pharmaunternehmen, die man uns nicht liefern konnte oder wollte. Die Kommission möchte nun deshalb auch die Einführung eines Mechanismus für die Verbreitung von neuen Impfstoffen in Rekordzeit.

Weltweit sollen bisher ca. 16500 Menschen an der Schweinegrippe gestorben sein, die sich zuletzt als unsere bekannte saisonale Grippe in milder Form entpuppte. Mehr als 400 000 Menschen waren aber angeblich jährlich immer an der Grippe gestorben. Die meisten Opfer hatten aber auch gleichzeitig andere Krankheiten. "Polskaweb" ist davon überzeugt, dass nicht nur Sars, Schweine- und Vogelgrippe Produkte der Pharma- Industrie und korrupten Medizinern, Medien und Politikern sind, sondern auch HIV und andere teure Dauerbehandlungs- Krankheiten mit denen man alljährlich Milliarden verdient. Die Welt ist verpflichtet die Nutzniesser dieser Betrügereien, ohne Rücksicht auf Rang, Namen und Masse, ihren gerechten Strafen zuzuführen. Wenn dies nicht geschieht, werden wir alle irgendwann nur noch für einen kleinen "erlesenen" Kreis von Verbrechern arbeiten und von ihnen abhängig sein.

Polish Health Minister to testify at Council of Europe inquiry into mass swine flu vaccinations

The Flu Case, 11 March 2010, 12:24

https://web.archive.org/web/20100525025743/http://www.theflucase.com/index.php?option=com_content&view=article&id=2985%3Apolish-health-minister-to-testify-at-council-of-europe-inquiry-into-mass-swine-flu-vaccinations&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Polish Health Minister Ewa Kopacz has been invited to testify at the inquiry underway at the Council of Europe Parliamentary Assembly, PACE, on whether the pharmaceutical industry influenced WHO to declare a pandemic emergency over the mild swine flu, so triggering national mass vaccination plans.

Kopacz, a family doctor, was the only health minister in Europe to refuse to buy the swine flu vaccine. She is to be asked about whether WHO and pharmaceutical companies exercised pressure on Poland after the decision was made not to buy the untested swine flu vaccines for which the pharma companies also refused to assume liability, reports Polskaweb.

UK MP Paul Flynn, who is preparing a report on the swine flu vaccine campaign for PACE, told Polish RMF FM radio that a study had shown that roughly as many people died of the swine flu in the UK as in Poland even though the UK bought enough swine flu vaccines for the entire population.

European parliament MEP Michele Rivasi, who is pushing for an inquiry in Brussels, said that fewer people died from the swine flu in Poland than did in France, but at least 3000 cases of adverse reactions to the swine flu jab have been recorded in France.

The French Health Minister Roseylne Bachelot bought 90 million doses of swine flu for about one billion euros but only about 7 million doses were used.

Dutch MEP Judith Merkies said that the government had spent 300 million euros on jabs of which 19 million remain unused.

Polish MEP Boguslaw Sonic said that the pharmaceutical companies had refused to give the Polish government information on the vaccines that it requested, reports Polskaweb.

Parliamentary Assembly
Assemblée parlementaire

Mr Paul Flynn
Rapporteur, United Kingdom, Socialist

Memorandum:
The handling of the H1N1 pandemic: more transparency needed

AS/Soc (2010) 12
Social, Health and Family Affairs Committee, PACE, 23 March 2010
http://assembly.coe.int/CommitteeDocs/2010/20100329_MemorandumPandemie_E.pdf

I. Introduction

1. The Parliamentary Assembly has always attentively observed governance issues of the public health sector in Council of Europe member states. The most recent reporting activities in this respect have been Recommendation 1725 (2005) on "Europe and bird flu – preventive measures in the health field", Recommendation 1787 (2007) on "The precautionary principle and responsible risk management" and Resolution 1649 (2009) on "Palliative care: a model for innovative health and social policies".

2. The rapporteur notes that the handling of the current H1N1 crisis is closely related to sensitive questions such as health experts' contractual relations with private stakeholders and possible conflicts of interest, levels of public spending and, last but not least, important issues of health and well-being of individual patients and the population at large. Furthermore, the transparency of public health decisions is closely linked to the way in which sensitive issues are communicated to the European public. The rapporteur intends to take the ongoing debate on these topical issues to a more objective level.

3. At the level of the Council of Europe, member states undertake intergovernmental co-operation activities regarding health topics with a view to contributing to the development of an ethical European health policy. Some of the main topics include blood transfusion, mental health, palliative care, patient participation transplants, and also good governance in the health sector, as well as bioethics and the quality of medicines and healthcare. For the Council of Europe and its Parliamentary Assembly, the observation of public governance in the health care field is a particular priority.

4. The rapporteur does not wish to undertake a scientific analysis of the H1N1 flu virus, which would be the specific mission of other international or European bodies such as the World Health Organisation (WHO), the European Centre for Disease Prevention and Control (ECDC) or the European Medicines Agency (EMEA). His memorandum is based, rather, on the understanding that the questions of public health governance arising from the H1N1 crisis are essential issues of the rule of law and democracy which are 'core values' of the Council of Europe. The rapporteur's main objective therefore is to identify and propose lines of action to enhance the transparency, accountability and coherence of the handling of future public health situations, whether these reach 'pandemic' levels or not.

5. With regard to public health issues at the Parliamentary Assembly, the rapporteur notably wishes to refer to the current report of his colleague, Ms Liliane Maury Pasquier (Switzerland, SOC), Chair of the Social, Health and Family Affairs Committee, on "Preventive Health Care Policies in the Council of Europe member states". In her draft recommendation, Ms Maury Pasquier proposes that the Assembly urges Council of Europe member states to evaluate their preventive health care strategies, to renew their commitment towards the health goals of the World Health Organisation (WHO) and to actively co-operate with WHO, within the global surveillance system, in order to halt the expansion of infectious diseases. Taking this approach into account and despite some of the criticisms raised in this memorandum, the Parliamentary Assembly should recognise the outstanding achievements made in public health in past decades, and the valuable contribution to this by WHO. The Assembly should continue to support WHO to improve public health in all possible ways, including from a good governance and human rights perspective.

6. When examining the handling of the H1N1 influenza, the rapporteur also considers it important to closely co-operate with WHO and main European bodies, including the European Commission and Parliament, as well as national governments, the pharmaceutical industry, academia and civil society. This dialogue has already been launched at the public hearing held on 26 January during the 2010 first part-session of the Assembly, the results of which have been included in the present memorandum. This dialogue will continue at a hearing in Paris on 29 March 2010, with the participation of public health experts and representatives of European governments.

II. Announcement and perception of the H1N1 'Pandemic'

...

III. Critical views of the governance of the current H1N1 crisis and first evidence found

...

IV. Recent reactions of various stakeholders involved in the handling of the H1N1 influenza

a) Reactions of WHO at different times of the pandemic

...

b) Reactions of the pharmaceutical industry

...

c) Follow-up and reactions at the level of the European Union and European Parliament

...

d) Various reactions in Council of Europe member states

...

V. Conclusions

44. The recent debate on H1N1, notably at a European level, has shown that the situation relating to this influenza is characterised by a high degree of uncertainty. The rapporteur is convinced that the way in which the H1N1 crisis has been handled is lacking in transparency. Certain facts have never been communicated to the European public; others have not been presented clearly enough. Even in this advanced stage of debate, and notwithstanding the lack of transparency has been pointed out on various occasions, some stakeholders are still not ready to react fully to allegations made and make all possible information available.

45. Concluding this first round of reflection on the way in which the H1N1 pandemic was handled, the rapporteur notes that WHO and other public health institutions involved in public decisions on the pandemic, have 'gambled away' some of the confidence that the European public has in these highly reputed organisations. This decline in confidence could be risky in the future. When the next pandemic arises many persons may not give full credibility to recommendations put forward by WHO and other bodies. They may refuse to be vaccinated and may put their own health and lives at risk.

46. The rapporteur considers that any further investigation should focus on the question of how to strengthen and render irreproachable the surveillance mechanisms in place within and around WHO. It is essential in this respect to ensure the Organisation's democratic accountability and transparency of decision-making in relation to its work, and finally to re-increase public confidence in WHO's recommendations. There are important lessons to be learned for the future from the current H1N1 pandemic and the way in which it has been dealt with.

47. The search for improvements should firstly be undertaken through inter-organisational dialogues at national, European and international level. In this respect, the rapporteur welcomes the willingness of WHO and other organisations to participate in the public hearings and debates organised by the Parliamentary Assembly, and hopes that they will continue this dialogue with a view to pursuing the common objective of preparing for future public health situations where the same issues, including those of transparency, might be raised.

48. In parallel, national public health authorities of Council of Europe member states should also contribute to rendering public health decisions more transparent and accountable. This they should do by addressing some of these highly sensitive issues at national level, and by participating in relevant exchanges at the European level. One of the issues to be examined is the democratic control of international organisations such as WHO through relevant bodies (World Health Assembly, Regional Committees of WHO, etc.).

49. There are numerous organisations and institutions at international, European and national level which have been concerned by pandemic preparedness planning and the implementation of subsequent vaccination strategies. Amongst these, the Parliamentary Assembly provides a European platform where issues relating to human rights, the rule of law and democracy can be raised. In this function, the Parliamentary Assembly could remain a moderator and partner in debates. Beyond consideration of sensitive issues related to the current H1N1 crisis, and in consideration of the vast amount of work on common topics which are already the subject of exchanges between WHO and the Council of Europe, the Parliamentary Assembly could even provide a parliamentary forum for regular debates on the activities of WHO. By comparison, there is a yearly institutional dialogue between the Assembly and the Organisation for the Economic Co-operation and Development (OECD). Similarly there are regular reports of the Assembly on the activities of the United Nations High Commissioner for Refugees (UNHCR) and on the International Organization for Migration.

CIDRAP

WHO sets up external panel to review pandemic response

CIDRAP, 29 March 2010

https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/who-sets-external-panel-review-pandemic-response

Mar 29, 2010 (CIDRAP News) – The World Health Organization (WHO) today said it is in the final stages of putting together an independent committee to review its preparation for and response to the H1N1 pandemic, a group of about 29 experts that will meet for the first time in the middle of April.

Keiji Fukuda, MD, special advisor on pandemic influenza to the WHO director-general, shared details about the review group with journalists in Geneva. The WHO posted an audio recording of the press conference on its Web site.

Fukuda said the independent review will parallel another review effort within the WHO that will examine pandemic response as part of a required evaluation of how the International Health Regulations (IHR) functioned during the outbreak. He said the H1N1 pandemic was the first major test of the IHR, which are an agreement outlining how governments should handle global health emergencies.

Fukuda and other WHO health officials have often said the group looks forward to the lessons learned from its pandemic response. "The bottom line is how we can do better with our preparations and response," he said.

The review's timing isn't a signal that the pandemic is over, he said. Instead, the review comes one year into the pandemic, when health officials have accumulated a lot of experience with the response and the actions are still fresh in people's memories.

Some elected officials and health ministers have criticized the response of the WHO and governments, claiming that health officials overreacted to the disease threat and were influenced by pressure from pharmaceutical companies to buy vaccine stockpiles. The WHO and health authorities from several countries have strongly denied the claims.

The Council of Europe (COE) has launched its own inquiry into the WHO and governmental pandemic responses, and today in Paris the social, health, and family affairs committee of the COE's Parliamentary Assembly (PACE) held its second hearing on the issue. The COE, separate from the European Union, works on issues such as civil rights, economics, and democracy. The group was established after World War II and is made up of elected officials from 47 nations.

The WHO is still putting together the pandemic review group, which will have a broad range of expertise, including scientists and public health experts both inside and outside the infectious disease arena. Fukuda said that though the review group will operate independently from the WHO, members will be required, like the WHO's internal expert groups, to make declarations of interest and reveal potential conflicts of interest.

The group will hold its first meeting Apr 12 to 14. The committee will elect its own chair and cochair, set its own agenda, and seek out its own expert assessments. It will produce a preliminary report on its actions for the WHO director-general to present to the World Health Assembly in May.

Fukuda said the WHO anticipates that many countries will want to air their views with the new committee, and countries will have the opportunity to speak or submit written comments at the group's first meeting. Though there won't be a public gallery for the meetings, representatives from governments and other groups will be welcome to observe, and the WHO is still working out how to provide media access.

A final report on the WHO's pandemic response will likely be completed in time for the WHO director-general to present to the May 2011 World Health Assembly.

At today's COE hearing, Paul Flynn, a socialist member of the British Parliament, presented an initial inquiry report on the WHO's pandemic response. Flynn said the report reflects a recent meeting with Gillian Merron, Britain's public health minister. He said he will meet with WHO officials on Apr 15 to gather more information. COE said in a press release that the PACE committee will likely approve the report in late April, in advance of a possible debate on the topic in Strasbourg in June.

Today the committee focused on transparency issues related to the WHO and governmental pandemic responses. The group heard from Poland's health minister, Ewa Kopacz, about the country's decision not to buy pandemic vaccine.

Also on the agenda were Marc Gentilini, a member of France's National Academy of Medicine, who spoke on France's pandemic response; Dr Tom Jefferson, from the Cochrane Collaboration, who spoke on the use of scientific evidence when making flu-related decisions; and Michele Rivasi, a European Parliament member who is calling for that group to launch an inquiry. The European Parliament is an elected group and is one of the European Union's two legislative branches.

http://assembly.coe.int/CommitteeDocs/2010/20100329_MinisterKopaczAddress.pdf

Madame Chair, Ladies and Gentleman,

Thank you much to the Parliamentary Assembly and the Council of Europe for taking up a subject that gave rise just recently to so much emotion and controversy. Thank you also for making it possible for the Polish Minister of Health to share her experience and the actions that we undertook during last year's flu pandemic. A pandemic whose announcement cost the world's tax payers hundreds and millions of Euros and at the same time ensured enormous additional profit for producers of vaccines for the pandemic.

Ladies and Gentleman the Polish reaction to this flu pandemic threat, a reaction which was quite different from those that prevailed in many other countries, was not the result of light-heartedness or slow decision making. From the time when in March April 2009 the first information was available about people falling ill with flu caused by a hitherto unknown virus called H1N1 Polish epidemiological and crisis reaction services immediately prepared themselves, analysed the situation and proposed appropriate measures to react to the possible threat. We also remained in close touch with the ECDC and other European and national centers designated to combat the new virus. Our actions were undertaken in accordance with a national pandemic plan developed on the basis of WHO's guidelines. Experts on epidemiology and infectious diseases issued recommendations for doctors and other healthcare professionals, we conducted a broad ranging informational educational campaign in particular aimed at children and school age youth and we also ensured that we combated symptoms of panic and general social unease.

It should be added that the relatively rapid announcement of successive levels of pandemic threat by WHO caused a lot of interest in the media which didn't really verify the significance of the figures that were provided and started to talk about upcoming 'apocalypse'. The media of course reminded societies of the famous 'Spanish' flu of 1918-1919 and the more recent avian flu which raised the level of social disquiet without the facts to support those statements. And that is why we prepared and transmitted information in accordance with our pandemic plan and we used the medical information available about the degree of threat but that was often marginalised by the media and they concentrated on the threat.

We also analysed the situation in the countries of the Southern Hemisphere where the flu season was underway and we were becoming very aware of the moderate nature this pandemic. All of this made it possible for us to serenely analyse the situation in so far as the alleged pandemic was concerned and to draw the appropriate conclusions. Ladies and Gentleman we wanted to take into consideration all possible scenarios so we invited pharmaceutical companies to negotiate with us,

companies that were working on a vaccine against the H1N1 flu virus. The Polish Flu Pandemic Committee had defined a high risk group including 2 millions persons in accordance with the recommendations of WHO and the ECDC and the Polish government set aside resources to buy appropriate numbers of vaccines but the conditions of purchase for vaccines proposed by producers were dubious for us, vaccines were to be purchased only by governments and not available directly to individuals, and to units of health care system, the producers of the vaccine expected that Polish government would take full responsibility for any undesirable side effects offering sale at the risk and on the responsibility of the purchaser.

For a long time it was also not clear whether each of us should be vaccinated once or twice and we were also concerned about information in the Euravigilin system about various undesirable effects and even the suspicion of some deaths. And the fact that the vaccine as offered was 2 to 3 times more expensive than vaccines against seasonal flu produced on the basis of the same technology is a fact on which I will not comment upon.

For these reasons the Polish government and I personally fully responsibly undertook a position not to purchase the vaccines on the conditions that were offered by pharmaceutical companies. I said at the time in the Polish parliament 'is it my responsibility to sign contracts in the interests of Poland or contracts in the interests of pharmaceutical companies?' I must admit that I said this as a doctor who has sworn to act for the good of patients and as a politician who has sworn to act in the interests of citizens. It is really not acceptable that producers of a medical vaccine thanks to the media campaign and taken advantage of fear that they should force government to take certain decisions; it is not acceptable for producers not to take responsibility for product for safety of patients and for undesirable side effects. It is not acceptable that governments should become hostages to interest groups and should take decision in an atmosphere of panic resulting from alarmist announcements in the media or the opinion of experts who have an interest in the situation themselves and who have not based their analysis on scientific terms, that is not acceptable at all.

Bitter thought to end, at the beginning of information becoming available 30 April 2009 during meeting Luxemburg during a meeting of Health Ministers of the European Union I talked about the need for coordination of purchases and distribution of vaccines by countries of the Union considering that combating the pandemic should be based on genuine European solidarity. I said that the criterion of access to the vaccines should not be how rich a country is but rather to what extent it is epidemiologically threatened. And I find it very painful to share with you the thought that there was no coordinated action by the community that the European answer to the pandemic threat which turned out to be not so serious as we initially thought has shown that in the European Union there is a deficit of solidarity and this lesson also shows that the announcement of each successive level and the scale of pandemic by WHO must be preceded by a very good scientific analysis and correct evaluation of the threat. Premature announcement of a pandemic, elimination of the criterion of the level of threat of the virus by WHO and using mainly the geographic criteria without taking into consideration the number of cases actually occurring within a given region has resulted in this excessive reaction by most countries in the world and I think that the international community is expecting now that WHO reduce the announced level of threat to the actual pandemic situation in individual regions of WHO which has not yet been the case.

And finally, this test was failed also and perhaps first and foremost by companies who produce vaccines because for them, corporate profit was more important than social responsibility. The experiences of last year's pandemic announcement are a very important lesson for us, we paid a very high cost – what is important now would be to draw the appropriate lessons from that experience.

Thank you.

Parliamentary Assembly
Assemblée parlementaire

Przemówienie Pani Ewy Kopacz,
Minister Zdrowia Rzeczypospolitej Polskiej
Wysłuchanie „Działania odnośnie grypy H1N1: potrzeba większej przejrzystości"
Zgromadzenie Parlamentarne Rady Europy
Komitet do Spraw Społecznych, Zdrowia i Rodziny

ParyŜ, 29 marca 2010 r.
http://assembly.coe.int/CommitteeDocs/2010/20100329_MinisterKopacz_PL.pdf

Szanowna Pani Przewodnicząca, Szanowni Państwo,

Dziękuję Zgromadzeniu Parlamentarnemu Rady Europy za podjęcie tematu, który nie tak dawno budził tak wiele emocji i kontrowersji. Dziękuję za moŜliwość podzielenia się przez polskiego ministra zdrowia naszymi doświadczeniami i działaniami podczas ubiegłorocznej pandemii grypy.

Pandemii, której ogłoszenie kosztowało podatników na całym świecie setki milionów euro, przysparzając producentom szczepionki pandemicznej, jak się szacuje, ogromnego dodatkowego zysku.

Szanowni Państwo,

Polska reakcja na zagroŜenie pandemią grypy, reakcja odmienna niŜ w wielu innych krajach, nie była spowodowana ani lekkomyślnością, ani opieszałością. Od chwili, gdy na przełomie marca i kwietnia 2009 roku pojawiły się pierwsze doniesienia o zachorowaniach na grypę spowodowanych nieznanym dotychczas wirusem, nazwanym A/H1N1, polskie słuŜby epidemiologiczne i reagowania kryzysowego niezwłocznie przeszły w stan wzmoŜonej gotowości, analizując sytuację i proponując odpowiednie środki odpowiedzi na ewentualne zagroŜenie. Pozostawaliśmy teŜ w łączności z ECDC i innymi europejskimi i narodowymi ośrodkami wyznaczonymi do walki z nowym wirusem. Nasze działania podejmowaliśmy zgodnie z opracowanym na podstawie wytycznych WHO Narodowym Planem Pandemicznym. Eksperci ds. epidemiologii, oraz chorób zakaźnych wydawali zalecenia dla lekarzy i innych pracowników ochrony zdrowia, prowadziliśmy szeroką kampanię informacyjną i edukacyjną kierowaną w szczególności do dzieci i młodzieŜy szkolnej. DuŜą wagę przywiązaliśmy teŜ do zwalczania objawów paniki i społecznego niepokoju, Trzeba tu dodać, Ŝe stosunkowo szybkie ogłaszanie kolejnych stopni zagroŜenia pandemicznego przez Światową Organizację Zdrowia spowodowało szerokie zainteresowanie mediów, które nie weryfikując znaczenia podawanych liczb wytworzyły obraz nadciągającej apokalipsy. Media przywoływały do pamięci społecznej słynną „hiszpankę" z lat 1918-19 i nieodległą grypę ptaków, co podwyŜszało stopień społecznego niepokoju w istotnym oderwaniu od faktów związanych z naturą tej pandemii - pandemii grypy A/H1N1 w przebiegu dość łagodnej. Dlatego teŜ przygotowana i przekazywana zgodnie z wytycznymi planu pandemicznego oraz wiedzą medyczną informacja nt. stopnia zagroŜenia, potencjalnych moŜliwości zakaŜenia oraz stosowania środków ochrony indywidualnej była w mediach bardzo często marginalizowana.

Analizowaliśmy takŜe sytuację w krajach półkuli południowej, gdzie właśnie trwał sezon grypowy i zdawaliśmy sobie sprawę z łagodnego charakteru pandemii.

To wszystko pozwoliło nam chłodno analizować sytuację pandemiczną i wyciągać z niej wnioski.

Panie i Panowie,

Biorąc pod uwagę kaŜdy scenariusz zaprosiliśmy do rozmów firmy farmaceutyczne, które podjęły prace nad szczepionką przeciwko grypie A/H1N1. Polski Komitet ds. Pandemii Grypy określił grupy szczególnego ryzyka, które objęły 2 miliony osób, zgodnie z rekomendacją WHO i ECDC. Polski rząd zabezpieczył środki na zakup odpowiedniej liczby szczepionek.

Jednak warunki zakupu szczepionek pandemicznych zaproponowane przez ich producentów wzbudziły w nas zasadnicze wątpliwości.

• Oferta sprzedaŜy nie przewidywała wprowadzania szczepionki do normalnego obrotu na rynku, lecz dotyczyła wyłącznie zakupu przez rząd. W konsekwencji szczepionka stawała się niedostępna dla jednostek ochrony zdrowia i osób prywatnych.

• Producenci szczepionki oczekiwali przejęcia przez polski rząd pełnej odpowiedzialności za działania niepoŜądane. czyli proponowały sprzedaŜ na ryzyko i odpowiedzialność nabywcy, w sytuacji, gdy oferowane szczepionki nie miały ukończonych badań klinicznych. Przez dłuŜszy czas nie było jasności co do liczby dawek (jedna czy dwie). Niepokoiły nas teŜ doniesienia o występowaniu działań niepoŜądanych (włącznie z podejrzeniami zgonów) wykazywane w systemie EUDRA-Vigilance.

• Fakt, Ŝe oferowane szczepionki były 2-3 krotnie droŜsze niŜ produkowane w tej samej technologii szczepionki przeciwko grypie sezonowej, pozostawiam bez komentarza.

Szanowni Państwo,

Z tych powodów z pełną odpowiedzialnością polski rząd i ja osobiście podjęliśmy decyzję o odstąpieniu od zakupu szczepionek na zaproponowanych warunkach. W polskim parlamencie powiedziałam wówczas tak: ”Czy moim obowiązkiem jest podpisywać umowy leŜące w interesie Polski, czy umowy leŜące w interesie koncernów farmaceutycznych?” Mówiłam to jako lekarz przyrzekający działać dla dobra pacjentów i jako polityk, przyrzekający działać dla dobra obywateli

• Nie moŜe bowiem być tak, Ŝe producenci szczepionek pod osłoną kampanii medialnych i wykorzystując usprawiedliwiony strach ludzi przed chorobami - stawiają rządy pod ścianą

• Nie moŜe być tak, Ŝe producenci leków nie biorą odpowiedzialności za swój produkt, za bezpieczeństwo pacjenta, za działania niepoŜądane

• Nie moŜe być tak, Ŝe rządy stają się zakładnikami grup interesów i podejmują decyzje w atmosferze paniki wywołanej alarmistycznymi doniesieniami medialnymi, oraz opiniami ekspertów, które są elementem gry interesów i nie mają wiele wspólnego z rzeczową analizą sytuacji

Na to zgody być nie moŜe!

Szanowni Państwo

I na koniec pewna gorzka refleksja:

Na początku europejskiej odsłony pandemii, 30 kwietnia 2009 w Luksemburgu, podczas spotkania ministrów zdrowia Unii Europejskiej mówiłam o konieczności koordynacji zakupów i dystrybucji szczepionek przez kraje Unii, widząc we wspólnym zwalczaniu pandemii waŜny dowód prawdziwej europejskiej solidarności. Mówiłam, Ŝe kryterium dostępności do szczepionki nie powinna być zasobność kraju, lecz jego sytuacja epidemiologiczna. Boleję nad tym, Ŝe nie doszło do skoordynowanych działań Wspólnoty, Ŝe europejska odpowiedź na zagroŜenie pandemiczne, które na szczęście nie okazało się tak groźne, jak pierwotnie sądzono, pokazało, Ŝe we wspólnej Europie istnieje jednak deficyt solidarności.

Ta lekcja pokazała takŜe, Ŝe ogłaszanie kaŜdego kolejnego stopnia w skali pandemicznej przez WHO musi być poprzedzone rzetelną analizą i prawidłową oceną zagroŜenia. Zbyt pochopne ogłaszanie pandemii, eliminacja kryterium zjadliwości wirusa i oparcie się przez WHO głównie na kryterium geograficznym, bez uwzględnienia liczby występujących w danym regionie zachorowań, spowodowało, Ŝe mieliśmy do czynienia z nadmierną reakcją większości państw świata. Do dziś formalnie obowiązuje szósty stopień zagroŜenia pandemicznego i społeczność międzynarodowa oczekuje od WHO obniŜenia stopnia zagroŜenia stosowanie do realnej sytuacji pandemicznej w poszczególnych regionach WHO.

Wreszcie tego testu nie przeszły takŜe, a moŜe przede wszystkim firmy produkujące szczepionki, skoro przedłoŜyły uzyskanie zysku korporacyjnego za wszelką cenę ponad deklarowaną społeczną odpowiedzialność.

Doświadczenia związane z ogłoszoną w zeszłym roku pandemią są dla nas wszystkich cenną lekcją. Zapłaciliśmy za nią bardzo wymierną cenę. Chodzi o to, by z tej lekcji wyciągnąć odpowiednie wnioski.

POLSKIE RADIO DLA ZAGRANICY ▸ thenews.pl

Poland praised for anti-swine flu strategy

Polskie Radio, 31 March 2010, 06:37
https://web.archive.org/web/20100403020128/http://www.thenews.pl/national/artykul128545_poland-praised-for-anti-swine-flu-strategy-.html

The Council of Europe has praised Poland's Health Minister Ewa Kopacz for her strategy against the swine flu virus.

The council's Committee on Social, Health and Family Affairs said that the Health Ministry's decision not to order any A/H1N1 vaccines, in spite of pressure from pharmaceutical companies and health organizations, was correct.

Ewa Kopacz (right) who went to Paris to explain her government's response to the flu virus - which the World Health Organisation was wrongly predicting would turn into a full blown pandemic across Europe - said that Poland had considered buying an anti-flu vaccine but terms proposed by pharmaceutical companies were unacceptable.

Poland's Health Minister said that thanks to the anti-swine flu strategy adopted in Poland fewer fatal cases of the virus were reported and the virus was less virulent than in other countries.

Paul Flynn, who wrote the Council of Europe report, called the decision "an act of courage" and stressed that other countries spent millions of euro on vaccines.

Former head of the French Red Cross Prof. Marc Gentilini said that Poland can serve as an example of how to handle the threat of an A/H1N1 pandemic.

The Health Ministry's decision not to buy anti-flu vaccines was fiercely criticized in Poland during the outbreak. Ombudsman Janusz Kochanowski even threatened to sue Ewa Kopacz over the government's policy. (mg/pg)

- 31.03.2010 11:32 And to think all those idiots who were jumping up and down threatening legal action.
  Pani Ewa has not only saved lives, more importantly from the average Pole's point of view, she saved them money!!! haiball
- 31.03.2010 13:07 Where are the Emilie Green's of the world now?
  Jozek
- 31.03.2010 14:31 I have never heard of someone in government being praised for doing nothing before. By not being prepared she endangered the lives of many. Look at what happened in Ukraine. I think we dodged this by good fortune, not good management. To say that her actions were a success and that the government can get away with doing nothing is foolish at best. We should not be singing her praises. Kilma
- 31.03.2010 14:34 Ewa Kopacz, we salute you!
  Thank God you have the good judgement to see that it was all a scam like the few thinking folks left in the world. R. Brzostek
- 31.03.2010 14:47 It's sad that you have been brainwashed Kilma that you do not realize the fear mongering that was spread in order to increase the profits of the pharma companies. More people die from the common flue that H1N1, there was no need to panic. What are we supposed to do, spend hundreds of millions of dollars each time an unsubstantiated claim of a pandemic is thrust upon us. You have your own money, you can always contact the pharma companies yourself if you want a shot, but don't expect tax payers to foot the bill because of your irrational fear. Nikki
- 31.03.2010 14:54 If I can add one more thing, I am not saying that pandemics can't occur, and its not like Poland wasn't prepared with quarantine procedures, but there is no reason to act prematurely by buying up millions worth of drugs when H1N1 didn't even rise up to the risk the simple common flu does and when the vaccine hasn't even been proven safe. Nikki
- 31.03.2010 15:32 @kilma
  On the contrary she WASN'T prepared to risk peoples lives. And she didn't do nothing. She reviewed the evidence, declined to sentence Poles to death by paying millions for a vaccine the doesn't work. hairball
- 31.03.2010 15:58 Another Polish lady I am all but falling in love with. The world may be entering the era when we see profoundly wise figures emerge from Poland one after another. Jasiek
- 31.03.2010 16:15 Hahaha Jasiek, love is in air :) Maciej Skiba

Paul Flynn

General Matters: Part of the debate in the House of Commons on 5th April 2011.

Newport West, 5 April 2011, 6:11 pm
https://www.theyworkforyou.com/debates/?id=2011-04-05c.987.0

The swine flu pandemic that never was is an extraordinary story of bad science, fortunes made, public money wasted and fear-mongering on a mass scale. It started in May 2009 when a new branch of flu was detected in Mexico. The epidemiology then and now is still the same – that this flu was very mild. It killed about one in every 10,000 who had it.

On the World Health Organisation website in May 2009, the definition of a phase 6 pandemic – a crucial issue – was that the flu had to be likely to cause "a terrible number" of deaths and serious injuries. In the next month, that definition was changed to take the severity of the flu out of the definition; it was described as a flu that was being experienced in more than two WHO areas. In June 2009, however, Margaret Chan declared a phase 6 pandemic. The world press turned up and asked what a phase 6 pandemic was and whether there was a phase 6.5 or a phase 7 pandemic. She said, "No, this is the most severe pandemic – the top one." Understandably, the world press went into hysteria mode and announced that this was as bad as the 1918 flu that killed between 25 million and 40 million people.

...

The World Health Organisation has been challenged since and there have been a number of inquiries. In this country, we had an inquiry by Deirdre Hine, but I am afraid that it was premature. It did not come up with the right answers because it did not ask the right questions. There is a far better inquiry, just published, by the European People's Party group in the European Parliament. Its main conclusion is that next time, the severity of the flu must be a feature in any warnings given. It is extraordinary that in calling this a phase 6 pandemic, no judgment was made about the severity of the disease.

...

A splendid example is provided by Ewa Kopacz, who was the Polish Health Minister at the time. In November 2009, she made a very brave speech saying that the Polish Government would not buy vaccines and antiviral medicines because she did not believe that H1N1 flu posed any serious threat. In Britain, having spent £1 billion, we lost 7.4 people per million of the population; Poland, having spent about 7 zlotys, ended up with 4.7 deaths per million. In other words, Poland spent virtually nothing, and suffered half the number of deaths per million that we suffered. There is a lesson to be learnt from that. As I said earlier, I do not blame the national Governments, because they were in a very difficult position. They had the advice of the World Health Organisation, which is a body that we should respect, because we need a body that is above the national melee and national interests. Can we blame the World Health Organisation? We certainly can.

...

THE FLU CASE

Top Polish leaders opposing euro and swine flu vaccines wiped out in mysterious plane crash

The Flu Case, 11 April 2010, 13:51
https://web.archive.org/web/20100413194516/http://www.theflucase.com/index.php?option=com_content&view=article&id=3270%3Atop-polish-leaders-opposing-euro-and-swine-flu-vaccines-wiped-out-in-mysterious-plane-crash&catid=41%3Ahighlighted-news&Itemid=105&lang=en

According to media, authorities are handling the deaths of top Polish political, military and economic leaders in a plane crash in the western Russian city of Smolensk on Saturday as an accident.

But a day after the crash, many unanswered questions surround the event.

Polskaweb has said that an assassination cannot be ruled out.

There are many reasons to dismiss the official story of how Poland's president, all of Poland's top army chiefs, the central bank governor and secret service chief died as a cover-up of massive proportions.

According to the mainstream media, the Polish delegation was flying from Warsaw to Smolensk to mark the 70th anniversary of the Katyn massacre of thousands of Poles by Soviet secret service during the second world war.

But the official ceremony marking the Katyn anniversary was held earlier in the week on Wednesday and attended by Polish Prime Minister Donald Tusk and Russian head of state Vladimir Putin.

The Polish President Lech Kaczynski was not invited.

How come Presidnt Kaczynski and half of Poland's government flew to Katyn three days after the official anniversary?

Why did100 figures who are vital for the day-to-day functioning of the Polish government go to a relatively insignificant ceremony, and not to the main one?

What reason could there be for the Polish central bank governor to fly to Katyn to attend the ceremony?

Why did the 100 top Polish leaders all fly on the same plane?

How could security protocols that require that even a president and his deputy fly separately be so relaxed that so many key people needed to run the Polish government from day to day are allowed to fly on the same plane?

And in a Russian Tupolev plane, and to the traditional arch-enemy of Poland, Russia?

This massacre of the Polish elite occurred on the way to commemorate the murder of 4000 Polish officers and intellecturals massacred by the Soviets in 1940.

But what is the probability of a second massacre of the entire Polish leadership occurring in the same place 70 years later?

Why were none of the journalists that accompany the president on the plane as usual?

According to Polish media, journalists were told that they had been assigned to another plane that had had technical problems and they would, therefore, need to switch to a third plane, delaying their arrival in Katyn.

The delay of the journalists in arriving at the scene of the crash allowed a better manipulation of the media coverage.

According to Bild am Sonntag and the Berliner Zeitung, a hotel close to the crash site was sealed off, possible to ensure that journalists who might have seen the crash could not send photos or reports.

A man who took pictures of the crash site using his mobile phone had to erase the photos at a police check point on his way home.

Polish and Russian officials said no-one survived the crash. All the bodies have been found, they allege - and yet at the same time, authorities say DNA tests will have to be carried out on the bones of many to identify them.

Have all the bodies been found? Or not?

Were there any bodies? How many?

What evidence is there that these people were on the plane to Smolensk at all apart from the passenger list issued by the authorities?

It is conceivable that the 100 top Polish leaders were rounded up in a purge and killed or kidnapped inside Poland and that the airplane accident in Russia was staged to explain their deaths.

A map of the air port north of Smolensk can be seen here:
http://maps.google.de/maps?%20hl=de&gl=de&ie=UTF8&ll=54.835896,32.063942&spn=0.110529,0.363579&t=h&z=12%20
http://maps.google.de/maps?%20hl=de&gl=de&ie=UTF8&ll=54.835896,32.063942&spn=0.110529,0.363579&t=h&z=12%20

Weather reports indicate clouds but little fog.
http://maps.google.de/maps?%20hl=de&gl=de&ie=UTF8&ll=54.835896,32.063942&spn=0.110529,0.363579&t=h&z=12%20

According to the official version, however, the plane hit trees as it approached Smolensk airport in thick fog, and caught fire.

The plane made four landing attempts because of the fog, according to the mainstream media.

But another witness reported hearing an explosion.

The damage of the plane shown is consistent with an explosion.

Debris was scattered around an area one kilometer.

Pilot error was a possible reason for the crash, according to the official story.

But the pilots chosen to fly heads of state are highly qualified.

Why was the plane flying so low that it hit a tree? Weren't the instruments measuring altitude on board working?

What was the co pilot doing?

Where was the military escort? The security service detail?

Russian media reports said the pilots ignored advice from air traffic control to divert to another airport.

"The pilot was advised to land in Minsk, but decided to land in Smolensk," said the spokesman, Andrei Yevseyenkov.

But pilots have to follow a standardised procedure for landing and must divert if there is visibility is too poor.

Other reports say Kaczynski himself intervened to force the pilot to land. How likely is it that the pilot would listen to the president and not follow standard procedures?

How likely that the entire army leadership would allow Kaczynski to force the pilot to land. The head of the Polish air force was also on board according to the official story.

Smolensk airport is a military airport classified as a "ClassOne Aiport" that can handle all types of planes, though there are conflicting reports about whether it had an ILS system.

The media says the Tu-154 also has a questionable safety record, and the presidential plane was at least 20 years old.

But other sources say the plane had just undergone a service. A thorough check is routine before a flight.

Planes as the safest means of travel in the world. Hardly any head of state has killed in a plane crash in the past 30 to 40 years. Now half the Polish government has died.

How likely is it that this was an accident?
Who gains from the death of so many leading Polish figures?

The main winner is Polish Prime Minister Donald Tusk who has wiped out the entire opposition to his pro-euro, pro-IMF, pro-New World Order policies, even though they appear to be some allies sacrificed on the plane, including the pro swine flu vaccine ombudsman.

Nevertheless, the backbone of Polish opposition to the NWO appears to have been killed.
"Among the victims were key members of Poland's biggest opposition party, Law and Justice, including current and former heads of the party's parliamentary caucus, Grazyna Gesicka and Przemyslaw Gosiewski as well as the party's main economic expert Aleksandra Natalli-Swiat, and deputy parliamentary speaker Krzysztof Putra.

The list also includes deputy parliamentary speaker Jerzy Szmajdzinski, who was the presidential candidate of the opposition Left Democratic Alliance. That means the crash killed the presidential candidates of two of Poland's three largest parties. Kaczynski had already won the endorsement of the opposition Law and Justice party. He was to officially declare his candidacy in May," reports Bloomberg.

With President Kaczynski out of the way and the two presidential candidates, the next president can appoint the top army leaders and the central bank governor as well as judges - in short replace the entire Polish government with people friendly to the New World Order and Bilderberg agenda.

Tusk's presidential candidate Komorowski has just said he would set the date of a presidential election which had been due in October forward to June, giving Tusk's party an added advantage.

Tusk appears to be just a puppet for the NWO, operating across countries, and including Putin, who is supposed to be leading the probe in the crash in Russia.

The bodies of the victims have been taken to Moscow.

There is evidence that many government officials work for the private interests of an international corporate crime syndicate, gearing up for the total destruction of nation states and the US dollar and euro to establish a one world government under the UN flagship.

Poland's top leaders have defied the NWO by refusing the swine flu vaccination and postponing joining the euro, a "must", according to IMF head Dominique Strauss-Kahn.

They have paid a heavy price.

True, *Tusk appeared to support his health minister when she refused to buy the swine flu vaccine last autumn.* But even the Austrian Health Minister criticized WHO for declaring a pandemic prematurely – but only after he saw how big the opposition to the vaccines in Austria already was.

Acting skills are vital for leadership, Adolf Hitler said.

By purging Poland of its top leadership and opposition, the NWO has sent out a signal, a clear warning to other government figures not to resist its agenda.

It is less likely that the Polish Health Minister will dare refuse vaccine the next time WHO declares a pandemic after this incident.

It is less likely that Greece's central bankers and opposition parties will push for Greece to leave the eurozone or operate a domestic currency in parallel with the euro.

That, anyway, is the calculation of the New World Order.

The murder of the Polish leaders signals the start of a new era of terror and could be the start of a whole series of purges of government officials opposing their agenda.

The NWO has declared war on us, and we must fight back.

The time for action has come.

THE FLU CASE

Could Obama's visit to Krakow spark a bird flu pandemic?

The Flu Case, 16 April 2010 13:36

https://web.archive.org/web/20100517152359/http://www.theflucase.com/index.php/?option=com_content&view=article&id=3311%3Acould-obamas-visit-to-krakow-spark-a-bird-flu-pandemic&catid=1%3Alatest-news&Itemid=64&lang=en

President Obama will fly to Krakow for the state funeral of President Lech Kaczynski almost one year to the day when he visited Mexico City in a trip that coincided with a swine flu pandemic outbreak.

Obama was in Mexico City on April 16th and 17th, 2009.

An archaeologist, Felipe Solis, who showed Obama around Mexico City's museum came down the following day with "flu-like symptoms" and *died seven days later, sparking a swine flu scare*.

Obama will be attending the funeral of Kaczynski in Wawel Castle on April 17th and 18th, 2010, almost one year exactly to the day.

Is there any chance of a bird flu pandemic breaking out this time? Will the globalists attempt another bioterrorism attack in Krakow?

It cannot be ruled out given the evidence that the globalists like to follow regular spatial, numerological and temporal patterns.

In addition, WHO and pharmaceutical companies have said they anticipate a bird flu pandemic in the near future.

The UK and French governments have cancelled swine flu vaccines – but only to purchase bird flu vaccines.

Apart from an interval of almost one year exactly, there are other parallels with Obama's visit to Mexico City and his visit to Krakow that suggest some major event might occur whether a bird flu pandemic or a false flag nuclear attack.

Firstly, the massed ranks of the world's media will be present for the funeral of Lech Kaczynski – and the corporate media's presence in Mexico City last April was a key factor in creating the enormous theatre and scare mongering around the swine flu pandemic when, in reality, the virus was mild.

Also, the setting of the funeral, the Royal Castle of Wawel, is rich in symbolism for the globalists.

Wawel Castle is the home of the Polish crown jewels: the Mexican National Museum visited by Obama last April housed the treasures of the Aztec empire, including the Aztec Sun Stone.

It appears that the globalists seek to make contact with the eternal and sacred source in external works of art and in historical buildings belonging to royal families and dynasties.

While most sacred traditions and religions such as Platonism, Christianity, Buddhism, Islam, Hinduism emphasise that the eternal and sacred is interior to our spirits, and can be accessed by meditation and intuition, aided by symbols and rituals, the globalists appear to believe they must look outside themselves for the sacred and physically travel to sacred places and enact rituals and rites to activate magical psychic powers.

It seems that the globalists consider Helena Blavatsky's esotericism cult art, involving rites and incantations for controlling spirits to be an ideology or dogma, and that they follow the same rituals, the same rites, and the same numerological and temporal patterns, over and over again.

The globalists like to see themselves as the heirs of the great civilisations of the Mayans, Egyptians and Greeks, Polish dynasties ec but there is evidence they project onto these civiliasations their own whimsical views.

Wawel Castle was the coronation site of Polish kings, and is now the representative building of the Polish state.

By taking control of Wawel Castle after decapitating the Polish elite in an engineered plane crash, the globalists could attempt to crown themselves symbolically as the leaders of Poland in a secret ceremony far from the prying eyes of the world, and to ask the occult forces to assist them in their plan for world domination by unleashing world war three or a bird flu pandemic.

Wawel Castle overlooking the Vistula river is a spectacular setting under the open sky, and the globalists like to re-enact ancient rituals and ceremonies of their cosmic struggle to take control of the globe in vast indoor and outdoor theatres.

There is evidence that the massacre of the Polish elite was planned over a long period of time and that Kaczynski's funeral will be held in Wawel castle only to allow the globalists to participate in an occult ceremony there.

Wawel Royal Castle is the burial place of the greatest of Polish kings, heroes and leaders, including Marshal Józef Piłsudzki, the architect of Poland's independence after 123 years of partition. Kaczynski's achievements pale in comparison.

Poland will mourn not so much his death as the death of leading generals, the central bank governor and the security chief.

Almost the entire top tier of the globalist politicians and royal families will be attending the funeral at Wawel, anxious to bathe themselves in the borrowed glory of Polish heroes.

In a ceremony that is reminiscent of a Shakespeare play, the very people who will benefit most from the plane crash, will be mourning the victims.

Shakespeare probes the character of deceit in his plays – and also the disastrous personal and social consequences of „Vaulting ambition, which o'erleaps itself."

The globalists need only read Shakespeare's Macbeth to find out what happens to those who driven by intense ambition overstep the invisible laws and limits set by the gods or God, and murder the innocent.

THE FLU CASE

Polish health minister testifies against swine flu jabs, half Polish government wiped out in plane crash days later

The Flu Case, 3 May 2010, 12:16

https://web.archive.org/web/20100517152645/http://www.theflucase.com/index.php?option=com_content&view=article&id=3378%3Apolish-health-minister-testifies-against-swine-flu-jabs-half-polish-government-wiped-out-in-plane-crash-days-later&catid=41%3Ahighlighted-news&Itemid=105&lang=en

On March 29th, Polish Health Minister Ewa Kopacz gave a devastating critique in Paris of the pharmaceutical companies, WHO and the pressure they had put on her to sign contracts for untested pandemic vaccines.

Kopacz was the only health minister to refuse the vaccine.

The Council of Europe Parliamentary Assembly inquiry into the pandemic found her to have acted correctly, saving the countries millions of euros.

When the Polish Health Minister stood up for Poland, she stood up for all people in Europe and the USA.

Ewa Kopacz helped us all to refuse the swine flu vaccination last autumn.

Days after her testimony in Paris, on April 10th, the *backbone of the Polish government was wiped out in a plane crash*.

There are many signs that this plane crash in Smolensk was engineered.

Is this a coincidence?

On April 13th, WHO flu chief Keiji Fukuda blamed the failed mass swine flu vaccination campaign on the internet for producing "news, rumours, a great deal of speculation and criticism in multiple outlets," including blogs, social networking and websites.

=> http://www.google.com/hostednews/afp/article/ALeqM5hTYjXT1VALSJAJKgjnRtFE3bom1Q

On April 16th, theflucase website was taken down, and has only just returned after a big struggle.

Is this a coincidence?

Is it a coincidence that the flucase went down just as the investigations into the Polish plane crash gathered pace, also on this website. and as the evidence grew that this was calculated, deliberate mass murder of the Polish elite?

Fortunately, I was able to activate my old blog - but attempts to transmit live video from Krakow where the funeral of President Lech Kaczynski took place were stopped. The IP address was blocked within two minutes each time.

Another video had to be put up twice because of interference. The counter of the video was blocked constantly. Marek Podlecki, the cameraman, got what appeared to be death threats by sms.

In short, everything was done to stop information on the plane crash spreading.

As a result of the deaths of the Polish elite, including the country's central bank governor, the Polish Prime Minister Donald Tusk can now impose vaccinations and the euro more easily on Poland as well as open the country's economy to the bankers.

Goldman Sachs which has a big stake in pharmaceutical companies that have seen vaccine orders cancelled and also in the banks that will profit from the euro and the raft of privatisations is now planning to set up a new office in Warsaw headed by a man fired by killed Lech Kaczynski.

Is this a coincidence?

Thanks to the internet, the information, facts and evidence showing that the plane crash in Smolensk was deliberate have spread very quickly.

The Polish people will hardly accept the state prosecutor sitting on the evidence of this appalling crime.

It is unacceptable that WHO, pharmaceutical companies and banks resort to what appear to be mafia methods.

It is unacceptable that the only country to reject the swine flu vaccine loses half its government within days of a key hearing in an obviously engineered plane crash.

It is unacceptable that websites like mine are de facto hacked and censored for giving facts, documents and evidence pointing to the dangers of this vaccine - quite apart from a campaign of viliification etc.

When the Polish Health Minister stood up for Poland, she stood up for all people in Europe and the USA.

It is time for us, the people in Europe and the USA, to stand up for the people of Poland, who are being subjected to such a brutal attack.

This is an extract from Kopacz's speech to the Council of Europe inquiry on March 29th:

For these reasons the Polish government and I personally fully responsibly undertook a position not to purchase the vaccines on the conditions that were offered by pharmaceutical companies.

I said at the time in the Polish parliament ‘is it my responsibility to sign contracts in the interests of Poland or contracts in the interests of pharmaceutical companies?’

I must admit that I said this as a doctor who has sworn to act for the good of patients and as a politician who has sworn to act in the interests of citizens.

It is really not acceptable that producers of a medical vaccine thanks to the media campaign and taken advantage of fear that they should force government to take certain decisions; it is not acceptable for producers not to take responsibility for product for safety of patients and for undesirable side effects.

It is not acceptable that governments should become hostages to interest groups and should take decision in an atmosphere of panic resulting from alarmist announcements in the media or the opinion of experts who have an interest in the situation themselves and who have not based their analysis on scientific terms, that is not acceptable at all.“

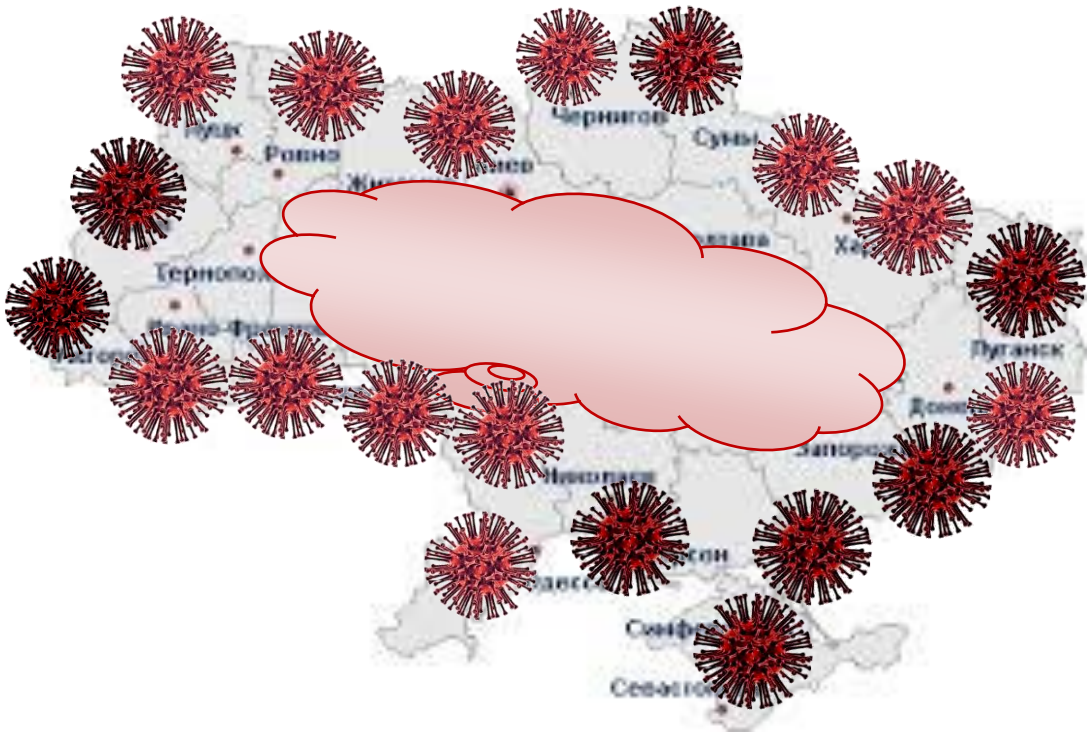
Chapter 7

Pandemic Attack

against

Ukraine



International Bioterrorism Table Top Exercise

Interpol, Warsaw, Poland, 29-30 September 2009

https://web.archive.org/web/20091110084341/http://www.interpol.int/Public/BioTerrorism/tabletop/default.asp

In September 2009, senior law enforcement officials, health care professionals and experts from international organizations joined their forces to confront a chilling crisis – *the plague had just been unleashed on their countries by unknown evildoers*.

A fictional scenario with a serious aim

Fortunately, this terrifying situation was a scenario under control, and the civilian authorities were all participants in a Tabletop Exercise on Preventing Bioterrorism hosted by INTERPOL. This exercise simulated a global bioterrorism attack and its aftermath. Participants in the Black Death scenario were faced with a fictional, intentional plague attack involving countries from their region, with the exercise designed to assist them in identifying critical co-operation and co-ordination issues which could hinder a quick and successful response to such an attack in real life.

The idea behind this exercise, the third in a series organized by INTERPOL, has been described by the Organization's Secretary General, Ronald K. Noble, as "helping focus our joint understanding of the role and responsibility of each of us – police, health care professionals, experts – in response to a bioterrorism incident, as well as identifying possible gaps or redundancies so that we can draw lessons from them."

Inter-agency co-operation in Central and Eastern Europe

Organized by the INTERPOL Bioterrorism Unit, this third edition of the event took place from 29-30 September in Warsaw, Poland. Participants in the workshop numbered 27 from six Central and Eastern European countries (Belarus, Czech Republic, Finland, Poland, Slovakia, Ukraine), as well as 15 participants from international organizations such as Europol, the UN Office for Disarmament Affairs (UNODA), the World Health Organization (WHO), the European Centre for Disease Control, the European Commission (Directorate General for Health and Consumer Affairs and Directorate General for Justice, Freedom and Security), the Organization for Security and Co-operation in Europe and the Commonwealth of Independent States (CIS).

A wide range of INTERPOL initiatives

The tabletop exercise is the latest in a series of initiatives launched by INTERPOL since the creation of its Bioterrorism Prevention programme. INTERPOL has worked ceaselessly since 2005 to heighten its member countries' awareness of the dangers of bioterrorism and to enhance their preparedness for a bioterrorist attack. The Bioterrorism Prevention Programme has co-ordinated a series of events, starting with the *Global Conference on Preventing Bioterrorism* in March 2005;

The 1st Interpol Global Conference on preventing bioterrorism. – Interpol, Lyon, France, 1-2 March 2005
https://web.archive.org/web/20091110211907/http://www.interpol.int/Public/BioTerrorism/Conferences/Conf01/default.asp

Rregional workshops in Africa, South America, Europe and Asia; train-the-trainer sessions all over the world; and practical tabletop exercises such as the one outlined above.

https://web.archive.org/web/20091110211912/http://www.interpol.int/Public/BioTerrorism/Workshops/Default.asp

Who Is Joseph Moshe?

Godlike Productions, User ID: 574264, 16 August 2009

https://www.bibliotecapleyades.net/ciencia/ciencia_influenza35.htm
Sourse: http://www.godlikeproductions.com/forum1/message861009/pg1

"Joseph Moshe (Moshe is the man's middle name) is a bio-scientist. He works (worked?) for a unit within Mossad. He is an Israeli citizen.

The Secret Service was not the agency involved in the surveillance of Moshe at his home in California. This was done by the FBI, who had orders to detain him, or "bring him in."

Moshe did not send a threat to the White House. Rather, he communicated that he intended to go public with information he had regarding the flu vaccine that is being prepared by Baxter Labs, an Austrian company.

The information is this: *The vaccine is being manufactured in Ukraine. It is not a vaccine at all, but rather an engineered genetically mutated bio-weapon meant to cause sickness and death. Moshe informed the White House he intended to go public with this information*. When he became aware that the FBI was about to detain him, he packed some belongings in his car and set out for the Israeli consulate, located in close proximity to the federal building where the standoff took place. FBI pursuit kept him from reaching his destination.

Mounted on top of the large black vehicle was a microwave weapon which fried the electronics in Moshe's car as well as any communication devices he had which might have been used to contact the media or others who could help him.

Moshe did not suffer the same effects of the gas and pepper spray that others would have because he had built up an immunity to such weapons as a by-product of his Mossad training.

Moshe was not handcuffed because he was not placed under arrest. After leaving police or FBI custody, he returned to Israel, where he is at this time.

The information comes from one of my confidential sources. I have reason to believe it is accurate. If I receive more information, I will post it."

THE FLU CASE

Joseph Moshe: "Swine flu vaccine is bioweapon"

The Flu Case, 21 August 2009

https://web.archive.org/web/20091102052516/http://www.theflucase.com/index.php?option=com_content&view=article&id=700%3Amicrobiologist-alleges-baxter-qswine-fluq-vaccine-is-a-bioweapon&Itemid=64

Joseph Moshe (MOSSAD Microbiologist)

Today, the MSM are not talking about this case any more. <...>

Professor Moshe had called into a live radio show by Dr. A. True Ott, (explanation of Joseph Moshe's call at 06:00) broadcast on Republic Broadcasting claiming to be a microbiologist who wanted to supply evidence to a States Attorney regarding tainted H1N1 Swine flu vaccines being produced by Baxter BioPharma Solutions. *He said that Baxter's Ukrainian lab was in fact producing a bioweapon disguised as a vaccine*.

He claimed that the vaccine contained an adjuvant (additive) designed to weaken the immune system, and replicated RNA from the virus responsible for the 1918 pandemic Spanish flu, causing global sickness and mass death. <...>

Does this sound like an insane conspiracy theory? Sure it does. Due to the scarcity and anonimity of the sources we would dismiss it as exactly that, if it weren't for some uncomfortable facts: Baxter Pharmaceutical has been caught, red-handed, in spreading a live, genetically engineered H5N1 Bird flu vaccine as a lethal biological weapon all over the world, destined to be used for human vaccinations. This happened just a few months ago. And only luck prevented a global catastrophe of epic proportions.

Baxter International Inc. had mixed live, genetically engineered avian flue viruses in vaccine material shipped to 18 countries. Only by sheer luck, a Czech laboratory decided to test the vaccine on a dozen ferrets, which all died in days. The World Health Organization was notified and catastrophe was averted. This was clearly a deliberate act on Baxter's part, because they adhere to BS3, bio-safety level three. Baxter admitted a "mistake". Such monumental screwups are totally impossible at that level. Many safety systems would have needed to be sabotaged, many key personell would have needed to be bribed. It simply can't be done without direction from the inside. They did not send out the wrong vial – they produced dozens of gallons of biological-weapon agent (genetically engineered live H5N1 / Bird flu virus), then sent it out as a "vaccine".

Baxter knew full well that their vaccine was lethal, because the year before they had tested it on a few hundred homeless Polish people – dozens died as a result. [See: Next page]

КорреспонденТ.net

Эксперты: В Украине свиной грипп просто задерживается

Корреспондент.net, Украина, 17 августа 2009, 18:04
https://web.archive.org/web/20090921052236/http://korrespondent.net/tech/health/937724

России (156), Польше (142) и Румынии (233), в стране до сих пор не зафиксировано ни одного случая (за исключением одного официально подтвержденного случая в июне и четырех случаев заболевания у паломниц из Украины, заразившихся во Франции).

Как пишет *Газета по-киевски*, закрадывается подозрение, что свиной грипп в Украине просто прячут.

Тем не менее, эксперты дают иные оценки ситуации.

"В Украине свиной грипп задерживается […] Говорить об эпидемии в Российской Федерации тоже пока рано, поскольку число больных не попадает под само определение эпидемии. Об эпидемии можно говорить, когда число больных приблизится к 1/4 населения страны", - объяснил в интервью изданию Виктор Гавура, инфекционист.

Он также добавил, что в России более высокая заболеваемость связана с более интенсивными темпами миграции населения. В Украине же они несколько ниже.

В ходе эпидемиологических расследований, проводимых в РФ, установили, что в большинстве случаев подхватившие грипп выезжали за рубеж организованными группами в рамках образовательных программ. Чаще всего они проживали в студенческих общежитиях вместе с учащимися из других стран с большим количеством инфицированных гриппом.

В Киеве на сегодняшний день уже подготовлены все инфекционные больницы для того, чтобы принять пациентов с вирусом A/H1N1 - эксперт

"В Украине же подобных поездок совершается значительно меньше. Все 156 случаев свиного гриппа в РФ не были клинически тяжелыми. В Киеве на сегодняшний день уже подготовлены все инфекционные больницы для того, чтобы принять пациентов с вирусом A/H1N1: есть специальные боксы, дезинфекционные растворы, прививочный материал, жаропонижающие средства. К тому же ВОЗ предоставила Украине для борьбы с пандемией гриппа A/H1N1 в виде гуманитарной помощи 61 тысяч доз препарата Тамифлю" - добавил эксперт.

Генетические особенности нового вируса придали ему способность размножаться не только в дыхательных путях, но и в желудочно-кишечном тракте человека

Как отмечает Газета, в конце июля американские ученые из Центра по контролю и профилактике заболеваний в Атланте опубликовали результаты исследования вируса гриппа A/H1N1. По их мнению, генетические особенности нового вируса придали ему способность размножаться не только в дыхательных путях, но и в желудочно-кишечном тракте человека, что вирусу гриппа обычно несвойственно.

Вероятно, именно поэтому у больных часто наблюдаются такие нетипичные для сезонного гриппа симптомы, как тошнота и понос. В результате заболевает практически весь организм, а не только органы дыхания. Примерно в два раза возрастает нагрузка на иммунную систему и на органы детоксикации – печень, почки и кожу.

Сбивать аспирином ее нельзя – может возникнуть так называемый синдром Рэя, чреватый летальным исходом

Характерна также температура до 39 градусов, при этом сбивать аспирином ее нельзя – может возникнуть так называемый синдром Рэя, чреватый летальным исходом. Поэтому от температуры в этом сезоне прописывают парацетамол, рассказывают эксперты.

По оценкам ВОЗ, в течение года, по заказу 50 стран, произведут пять миллиардов доз вакцин. Каждая доза – не меньше 10 долларов. Однако до сих пор неизвестно, насколько эти вакцины эффективны и безопасны. Так, в 1976 году, когда в США была проведена вакцинация от вируса H1N1, несколько человек умерли от синдрома, который вызывал паралич.

Однако, отмечает издание, три тысячи волонтеров в США, 500 человек в Австралии, около 450 семей в Финляндии уже готовы участвовать в тестировании вакцины от A/H1N1.

Вместе с тем, ведущие европейские медики назвали предстоящую вакцинацию от свиного гриппа - массовым экспериментом над людьми. А из Британии пришли тревожные сообщения о побочных эффектах, которые наблюдались у детей.

Напомним, министр здравоохранения Украины Василий Князевич ранее сообщал, что украинский Минздрав получил от Всемирной организации здравоохранения 61 тысячу доз препарата Тамифлю.

Кроме того, Князевич еще в июне исключил создание отечественной вакцины против гриппа A/H1N1 до сентября. Министр заявил, что в Украине регулярно проводятся проверки людей, прибывших из стран, где зафиксированы случаи заболевания гриппом.

Свиной грипп:
Врачи призывают украинцев воздержаться от преждевременной паники

Корреспондент.net, Украина, 22 сентября 2009, 17:17
https://web.archive.org/web/20100109184607/http://korrespondent.net/tech/health/975504

Первый заместитель главного государственного санитарного врача в Украине Людмила Мухарская заявила, что к обычному сезонному гриппу в стране может добавиться вирус гриппа A/H1N1.

Сегодня на пресс-конференции Мухарская призвала воздержаться от преждевременной паники.

"У нас еще есть время, чтобы принять все необходимые меры для защиты от A/H1N1. Кабмин уже утвердил план с тремя уровнями безопасности, которые предусматривают необходимые меры в случае возникновения пандемии в Украине", - сказала она.

"Мы работаем над созданием нормативных актов, согласно которым, в случае возникновения в Украине свиного гриппа вакцинация была бы обязательной", - сказала глава подкомитета Верховной Рады по вопросам медицинского страхования и контроля над исполнением госпрограмм в сфере здравоохранения Раиса Сорочинская-Кириленко.

По ее словам, в данное время в Украине не работают над созданием собственной вакцины от гриппа A/H1N1.

Напомним, сегодня в санитарно-эпидемиологической станции Донецкой области сообщили, что за минувшую неделю число заболевших острыми респираторными вирусными инфекциями (ОРВИ) в области выросло на 31,1%.

КорреспонденТ.net

В Тернополе объявлена эпидемия гриппа

Корреспондент.net, Украина, 21 октября 2009, 00:29
https://web.archive.org/web/20100227100749/http://korrespondent.net/tech/health/1005535

Ситуация относительно заболеваемости ОРВИ в Тернополе резко осложнилась

Чрезвычайная противоэпидемическая комиссии города Тернополя сегодня приняла решение №17 О введении на территории города противоэпидемических мероприятий в связи с объявлением эпидемии гриппа и ОРВИ.

Об этом сообщили в пресс-службе Тернопольского городского совета.

Ситуация относительно заболеваемости острыми респираторными вирусными инфекциями в г. Тернополе резко осложнилась. По состоянию на 20 октября 2009 г. заболеваемость ОРВИ составляет 1 72,55 случаев на 10 тыс. населения. По сравнению с аналогичной неделей 2008 г. отмечается рост в 2,3 раза, с прошлой неделей - рост в 2 раза, со средним недельным показателем за последние 10 лет - в 2 раза. В структуре заболеваемости удельный вес детей до 14 лет составляет - 48 %, а детей школьного возраста от всех заболевших детей - 59,3%.

По данным мониторинга заболеваемости ОРВИ и грипп среди учеников школ установлено, что в 13 школах города процент отсутствующих учеников составляет больше 20%. Закрыты несколько классов школ города.

Эпидемиологический порог для Тернополя составляет 160 больных на 10 тыс. населения.

С целью предотвращения распространения заболеваемости гриппом и ОРВИ в г. Тернополе и руководствуясь законом Украины О защите населения от инфекционных болезней №1645-111 от 6 апреля 2000 г., чрезвычайная противоэпидемическая комиссия решила объявить г. Тернополе эпидемию гриппа и ОРВИ.

Согласно решению, необходимо временно прекратить с 21 октября 2009 г., учебу в школах, НПО Школа - детский садик, лицеях.

На время эпидемии гриппа и ОРВИ комиссия запретила проведение массовых мероприятий для детей и подростков, временно остановлены занятия для детей и подростков в кружках, секциях, бассейнах, танцевальных клубах. Также запрещено проведение дискотек для подростков как в заведениях, подчиненных управлению образования, культуры, по делам семьи и молодежи, так и в частных заведениях.

Также комиссия посоветовала ограничить массовые мероприятия для молодежи и студентов в учебных заведениях и массовые мероприятия для взрослых в культурно-художественных, зрительских, спортивных заведениях, домах культуры, театрах.

Ранее сообщалось, что в Украине, по данным Центра гриппа и острых респираторных инфекций Министерства здравоохранения, показатели заболеваемости гриппом и ОРВИ находятся на неэпидемическом уровне.Как сообщил Минздрав Украины, по данным центра, по 10 контрольным городам, за прошлую неделю заболели 42 тысячи 83 человека, госпитализированы 251 чел (из них детей - 235). Показатель на 10 тысяч составляет 43,8.

КорреспонденТ.net

Эпидемия гриппа в Тернопольской области: семь человек умерли, свыше 10 тысяч заболевших

Корреспондент.net, Украина, 27 октября 2009, 14:55
https://web.archive.org/web/20100304083724/http://korrespondent.net/tech/health/1011921

По состоянию на понедельник, 26 октября, в Тернопольской области из-за вируса гриппа умерли семь человек. Кроме того, в области зарегистрировано более 10 тысяч случаев заболевания гриппа.

Информацию о летальных случаях среди больных гриппом сегодня, 27 октября, во время пресс-конференции подтвердил начальник главного управления охраны здоровья Тернопольской облгосадминистрации Богдан Ониськив.

Как информирует Тернопольская правда, медики связывают эти смерти с осложнениями, вызванные гриппом. Конкретные имена умерших, и все что с этим связано Ониськив отказался разглашать, чтобы лишний раз не волновать людей, но сказал, что практически все умершие - молодые люди, которые не имели проблем со здоровьем.

За прошлую неделю лишь в одном Тернополе с симптомами заболевания неизвестным гриппом к врачам обратилось почти шесть тысяч людей. В то же время происхождение вируса до сих пор неизвестно. "Тип гриппа можно определить только через полторы недели, окончательные результаты должны прийти из Лондона", - заявил чиновник.

Ониськив объясняет катастрофическую ситуацию именно в Тернополе тем, что в городе много эмигрантов, которые могли завезти вирус из-за рубежа. Он заверил, что это не связано с мусором, ситуацию полностью контролируют, а больницы получили препараты под названием Тамифлю.

"Обострение ситуации с ОРВИ у нас началось две недели назад. С 12 по 18 октября было зафиксировано 3938 случаев заболевания на ОРВИ. С 19 по 25 октябре зарегистрировано 10119 случаев. Ситуация напряженная, в некоторых районах области объявлены ограничительные мероприятия. Заседаниями чрезвычайных противоэпидемических комиссий принято решение о введении карантина в учебных заведениях", - заявила заместитель главного санврача области Нинель Цяпа.

На основании решения областной противоэпидемической комиссии, управления образования и науки при райгосадминистрациях трех районов (Гусятин, Збараж, Подгайцы) перенесли каникулы и прекратили учебу в школах. Всего по области приостановлены занятия в 106 заведениях, в которых учятся 41598 учеников.

По мнению специалистов, причинами ранней заболеваемости людей в области может быть резкое похолодание и колебание температур за неделю до начала отопительного сезона, а также то, что за последние 5-7 лет в области не регистрировалась эпидемия ОРВИ. Кроме того, появляются новые штаммы вируса.

По данным властей, на сегодняшний день ситуация под контролем - медики оказывают помощь в полном объеме. Кроме того, появилось распоряжение председателя ОГА относительно преодоления последствий повышения заболеваемости на вирусные инфекции. Медики призывают жителей области при первых проявлениях заболевания обращаться к врачу.

Как сообщалось, 20 октября чрезвычайная противоэпидемическая комиссии города Тернополя приняла решение о введении на территории города противоэпидемических мероприятий в связи с объявлением эпидемии гриппа и ОРВИ.

УКРАЇНСЬКА ПРАВДА

Свинячий грип дійшов до українських дипломатів

Українська Правда, 27 жовтня 2009, 17:39
https://web.archive.org/web/20091030020006/http://www.pravda.com.ua/news/2009/10/27/104103.htm

У кількох співробітників посольства України в США підозрюють свинячий грип.

Про це, "Українській правді" повідомили джерела в посольстві.

"Підтверджено кілька випадків захворювання", - розповів співрозмовник.

У свою чергу речник МЗС Валерій Джигун повідомив, що видатки на лікування осіб, у яких запідозрене захворювання свинячим грипом, повним обсягом профінансовано посольством.

"Міністр закордонних справ дав доручення щодо опрацювання питання фінансування видатків на медичне страхування співробітників закордонних дипломатичних установ", - додав він.

У сотрудников посольства Украины в США подозревают свиной грипп

News.ru, Украина, 27 октября 2009, 20:34
https://web.archive.org/web/20091031191720/http://rus.newsru.ua/ukraine/27oct2009/hrippes.html

У нескольких сотрудников посольства Украины в США подозревают свиной грипп. Об этом сообщили источники в посольстве.

"Подтверждены несколько случаев заболевания", - рассказал собеседник, передаёт "Украинская правда".

В свою очередь спикер МИД **Валерий Джигун** сообщил, что расходы на лечение лиц, у которых подозрение заболевания свиным гриппом, в полном объёме профинансированы посольством, за счёт стабилизационного фонда правительства.

"Министр иностранных дел дал поручение относительно отработки вопроса финансирования расходов на медицинское страхование сотрудников заграничных дипломатических учреждений", - добавил он.

Отметим, что в Германии в понедельник началась самая масштабная за всю историю страны вакцинации населения против свиного гриппа (A/H1N1). Федеральные земли, отвечающие за мероприятие, заказали 50 миллионов порций вакцины Pandemrix.

В первую очередь прививка будет сделана гражданам повышенной группы риска - врачам, медсёстрам, спасателям и полицейским, а также хроническим больным.

Вирус гриппа A/H1N1 начал свое "шествие" в США и Мексике. За короткий период времени грипп охватил огромное количество стран, и в июне ВОЗ объявила о самом высоком - шестом - уровне опасности.

Новый штамм эпидемиологи называют "калифорнийским", а обыватели – свиным.

24 октября 2009 года президент США Барак Обама подписал декларацию, объявляющую эпидемию вируса гриппа A/H1N1 2009 года национальным бедствием.

Памятка о том, как уберечься от опасного заболевания, в частности от свиного гриппа, была размещена на сайте Минздрава. Среди рекомендаций – избегать поездок в регионы, где выявлены случаи заболеваний. На период эпидемии Минздрав рекомендует ограничить пребывание в людных местах, избегать контактов с людьми, у которых заметны симптомы респираторной инфекции.

Эпидемия гриппа в Тернопольской области: семь человек умерли

Корреспондент.net, Украина, 28 октября 2009, 10:05
https://web.archive.org/web/20091101221557/http://korrespondent.net/video/ukraine/1012142

По состоянию на понедельник, 26 октября, в Тернопольской области из-за вируса гриппа умерли семь человек. Кроме того, в области зарегистрировано более 10 тысяч случаев заболевания гриппа.

Информацию о летальных случаях среди больных гриппом вчера, 27 октября, во время пресс-конференции подтвердил начальник главного управления охраны здоровья Тернопольской облгосадминистрации Богдан Ониськив.

В свою очередь в тернопольской областной санитарно-эпидемиологической станция заявили, что лабораторно не было подтверждено ни одного летального случая от гриппа или ОВРЗ.

КорреспонденТ.net

Во Львовской области из-за осложнений гриппа умерли четыре человека

Корреспондент.net, Украина, 28 октября 2009, 12:24
https://web.archive.org/web/20220217042702/https://korrespondent.net/tech/medicine/1012235-vo-lvovskoj-oblasti-iz-za-oslozhnenij-grippa-umerli-chetyre-cheloveka

В Дрогобычском районе Львовской области за последнюю неделю из-за осложнений гриппа умерли четыре человека.

Об этом сегодня, 28 октября, сообщил начальник отдела здравоохранения Дрогобычского горисполкома Андрей Шевкенич. По его словам, это связано, в первую очередь, с несвоевременным обращением в медучреждения, поздней госпитализацией и самолечением.

"Только за последние сутки скорая помощь получила более 50 вызовов, связанных с симптомами гриппа. Вследствие этого 11 человек госпитализированы", - отметил Андрей Шевкенич.

Также, по словам Шевкенича, для борьбы с вирусом создан штаб под руководством первого заместителя городского председателя Дрогобыча, председателем штаба назначен начальник отдела здравоохранения Дрогобычского горсовета. На борьбу с гриппом выделены 100 тысяч грн и уже началось распределение этих средств по учреждениям. В школах и детсадах введен карантин. В детских больницах Дрогобыча и Стебника выделены дополнительные места.

"По моему мнению, то, что происходит сейчас - это пик, надеяться на спад заболеваемости можно будет через неделю, - отметил Андрей Шевкенич.

Как сообщалось, 20 октября все общеобразовательные школы, дошкольные и внешкольные учебные заведения Тернополя и трех районов области закрыли на карантин в связи с повышенной заболеваемостью ОРВИ.

Вчера, 27 октября, стало известно, что в Тернопольской области от острой респираторной вирусной инфекции умерли семь человек. В связи с этим проводится комплекс мер против распространения вируса гриппа.

КорреспонденТ.net

В Тернопольской области растет число жертв неизвестного вируса

Корреспондент.net, Украина, 28 октября 2009, 14:33
https://web.archive.org/web/20220217042702/https://korrespondent.net/tech/medicine/1012457-v-ternopolskoj-oblasti-rastet-chislo-zhertv-neizvestnogo-virusa

Министр здравоохранения Украины Василий Князевич подтверждает девять летальных исходов в Тернопольской области от пневмонии.

"На сегодняшний день умерло в области девять человек с диагнозом пневмония, 95 человек с диагнозом пневмония госпитализированы, 25 больных подпадают под тяжелый ход заболевания", - сообщил Князевич.

Он отметил, что в настоящий момент порог заболеваемости вирусными инфекциями начинает повышаться и в других западных областях Украины, в частности в Ивано-Франковский и Львовской. Министр отметил, что главное задание - определить вирус, который вызывает болезнь.

"Предварительный диагноз - вирусная пневмония. Экспресс-диагностика на предмет заболевания калифорнийским гриппом A/H1N1 не подтверждается", - сказал Кназевич.

По его словам, на сегодня диагноз вирусная пневмония установлен предварительно у 95 человек, из них 25 больных находятся в тяжелом состоянии. Князевич уточнил, что тяжелой формой вирусной пневмонии заболели 17 взрослых и 8 детей.

Князевич также призвал население обращаться к медикам при первых признаках простуды. "Чувствуете себя больным, или как-то не так - обязательно обратитесь к врачу", - призвал Князевич. При этом он отметил, что не следует полагаться на рекламу или народные способы лечения, а четко определить диагноз при помощи врачей.

Он отметил, что создан штаб по реагированию на ситуацию, а также отметил, что ситуация взята под контроль главным санитарным врачом. Кроме того, министр сообщил, что он связался с Всемирной организацией здравоохранения на случай, если понадобится их помощь.

Министр также сообщил, что завтра на заседании правительства выступит с докладом о ситуации в Тернопольской области, а после заседания правительства отправится на место происшествия.
Он добавил, что сегодня в Тернопольскую область отправляется Главный государственный санитарный врач Украины.

Напомним, вчера, 27 октября, начальник управления здравоохранения Тернопольской облгосадминистрации Богдан Ониськив сообщил, что в Тернопольской области умерли семь человека от гриппа, эпидемия которого сейчас объявлена в области. Среди умерших двое жителей Тернополя, двое - Борщевского района, один - Теребовлянского района.

Сегодня, 28 октября, начальник отдела здравоохранения горисполкома Дрогобыча Андрей Шевкенич заявил, что за последнюю неделю из-за осложнений гриппа умерли четыре человека.

КорреспонденТ.net

Минздрав поручил лечить пациентов независимо от места их проживания

Корреспондент.net, Украина, 28 октября 2009, 17:21
https://web.archive.org/web/20091031022158/http://korrespondent.net/tech/health/1012519

МОЗ призывает украинцев при появлении симптомов ОРВИ срочно обращаться к медикам.

Министерство здравоохранения Украины заявляет, что в октябре в западных областях Украины, по предварительным данным, от пневмонии умерли 20 человек. Минздрав призывает всех граждан в случае появления симптомов гриппа или других острых респираторных вирусных заболеваний немедленно обращаться к врачам.

Об этом сегодня, 28 октября, во время пресс-конференции заявил первый заместитель министра здравоохранения Василий Лазоришинец.

По его данным, за период с 13 октября в Тернополе 95 человек были госпитализированы, из них 25 в тяжелом состоянии (7 детей и 18 взрослых), умерли 10 человек. Кроме того, во Львове за период с 1 октября на стационарном лечении находилось шесть человек, четыре умерли. В Ивано-Франковске с 13 октября шесть человек умерли, госпитализированы 25 человек, из них семь в тяжелом состоянии.

Лазоришинец напомнил, что в 2008 году от пневмонии в Украине умерло 6 тыс. 465 человек, а болели более 238 тыс.

"Сложившаяся ситуация связана с диагнозом пневмония", - сказал, в свою очередь, главный государственный санитарный врач Украины Александр Биловол.

При этом он также подчеркнул, что всем госпитализированным были проведены тесты на наличие вируса A/H1N1, которые дали отрицательный результат.

Отвечая на вопрос о том, можно ли исключить, что причиной смерти людей в западных областях стал вирус A/H1N1, присутствующий на пресс-конференции главный санитарный врач Украины Александр Биловол сказал: "В этой жизни ничего нельзя отбрасывать".

Он подчеркнул, что в целом на сегодня в государстве ситуация с гриппом контролируемая, отмечается рост порога заболеваемости только в западных регионах страны за последние полторы недели".

Биловол сообщил, что министерство здравоохранения поручило медицинским учреждениям обслуживать пациентов с простудными заболеваниями вне зависимости от места их проживания и регистрации для предупреждения возникновения эпидемии.

"В одном из пунктов плана мероприятий в данной ситуации (резкого повышения заболеваемости) четко сказано, что либо иногородние, либо приезжие, они могут в любую поликлинику, любую больницу обратиться - и им там будет предоставлена неотложная помощь", - сказал он.

По слова Биловола, в эти регионы направлена комиссия для выяснения обстоятельств причин смерти этих людей. Также он подчеркнул, что в случаях с летальным исходом пациенты обратились к врачу не в первые дни заболевания, а позже (до недели).

В этом контексте главный санврач призвал всех украинцев в случае появления симптоматики гриппа или других острых респираторных вирусных заболеваний немедленно обращаться к врачу, чтобы не допустить распространения гриппа по Украине.

Как сообщалось, сегодня, 28 октября, министр здравоохранения Украины Василий Князевич подтвердил девять летальных исходов в Тернопольской области от пневмонии.

Кроме того, сегодня же начальник отдела здравоохранения горисполкома Дрогобыча Андрей Шевкенич заявил, что за последнюю неделю из-за осложнений гриппа умерли четыре человека.

Сегодня утром в перинатальном центре Ивано-Франковска из-за легочного заболевания умерла беременная женщина.

В Черновцах зарегистрирован первый случай смерти больного пневмонией

Корреспондент.net, Украина, 29 октября 2009, 11:05
https://web.archive.org/web/20091031231023/http://korrespondent.net/tech/health/1012740

В Черновцах зарегистрирован первый случай смерти больного пневмонией. Медики не исключают, что имеют дело с ранее неизвестным вирусом.

"Больную девушку госпитализировали в крайне тяжелом состоянии", - сообщил главный врач городской клинической больницы №3 Виктор Свитун. По его словам, сразу же был созван консилиум с участием наилучших специалистов. У больной обнаружили легочную недостаточность, врачам не удалось ее спасти.

По словам родителей девушки, она болела уже 4 - 5 дней обычной простудой. Но такого быстрого развития пневмонии в Черновцах еще не было.

"По данному случаю было проведено эпидемиологическое расследование, которое не подтвердило наличие вирусов ОРЗ и гриппа", - сказал заведующий эпидемиологическим отделом Черновицкой областной санитарно-эпидемиологической станции Юрий Падурару.

Врачи допускают, что пневмония является рецидивом ОРВИ и гриппа или неизвестного ранее вирусом. Симптомы хода заболевания - быстрое развитие пневмонии, отсутствие насморка и кашля. Именно с такими симптомами, по неофициальной информации, в городе умерли еще два человека.

Как сообщалось, Министерство здравоохранения Украины заявляет, что в октябре в западных областях Украины, по предварительным данным, от пневмонии умерли 20 человек. Минздрав призывает всех граждан в случае появления симптомов гриппа или других острых респираторных вирусных заболеваний немедленно обращаться к врачам.

В Черновцах - первый официальный случай смерти от нетипичной пневмонии Неофициально - есть ещё два

News.ru, Украина, 29 октября 2009, 13:02
https://web.archive.org/web/20091101122837/http://rus.newsru.ua/ukraine/29oct2009/pnevmonua.html

В Черновцах зарегистрирован первый случай смерти больного пневмонией. Медики не исключают, что имеют дело с ранее неизвестным вирусом, пишет сегодня КорреспонденТ.net.

"Больную девушку госпитализировали в крайне тяжёлом состоянии", - сообщил главный врач городской клинической больницы №3 **Виктор Свитун**. По его словам, сразу же был созван консилиум с участием наилучших специалистов. У больной обнаружили лёгочную недостаточность, врачам не удалось её спасти.

Минздрав призывает при признаках простуды сразу обращаться к врачам

По словам родителей девушки, она болела уже 4 - 5 дней обычной простудой. Но такого быстрого развития пневмонии в Черновцах ещё не было.

"По данному случаю было проведено эпидемиологическое расследование, которое не подтвердило наличие вирусов ОРЗ и гриппа", - сказал заведующий эпидемиологическим отделом Черновицкой областной санитарно-эпидемиологической станции **Юрий Падурару**.

Врачи допускают, что пневмония является рецидивом ОРВИ и гриппа или неизвестного ранее вируса. Симптомы хода заболевания - быстрое развитие пневмонии, отсутствие насморка и кашля. Именно с такими симптомами, по неофициальной информации, в городе умерли ещё два человека.

Министерство здравоохранения Украины заявляет, что в октябре в западных областях Украины, по предварительным данным, именно от пневмонии умерли 20 человек, но многие опасаются, что причина этому – свиной грипп.

Минздрав призывает при признаках простуды сразу обращаться к врачам

Минздрав, тем временем, призывает всех граждан в случае появления симптомов гриппа или других острых респираторных вирусных заболеваний немедленно обращаться к врачам.

Как передаёт УНИАН, об этом министр здравоохранения Украины **Василий Князевич** заявил сегодня, на заседании правительства.

"Врачи знают, как оказывать помощь, но есть проблема своевременного обращения к врачу. Сейчас нам нужно очень интенсивно работать с населением. Паники здесь не должно быть. Во-первых, обращение к врачу, а у врача – соответствующий алгоритм работы", - сказал Князевич.

Министр также считает необходимым обратиться к руководителям предприятий с просьбой "отпускать людей, которые плохо себя чувствуют".

"Нужно больных людей изолировать, а дома с ними могут работать врачи. Это лучший выход, как предотвратить распространение эпидемии", - добавил Князевич.

В свою очередь премьер-министр Украины **Юлия Тимошенко** поручила подготовить необходимое обращение к гражданам с призывом своевременного обращения к врачам.

Впрочем иногда обращение в медструктуры может не повлиять на ход болезни. Так одна из жительниц "болеющей" Тернопольской области рассказала СМИ, что когда заболела, врача ей пришлось ждать два дня.

При том, что главные здравоохранители страны говорят, что именно позднее обращение к врачам является причиной осложнений, которые могут иметь летальный исход, а в Тернопольской области, между тем, официально подтверждены уже 10 смертей.

Shock! Pestilence expected in Ukraine? 20 people died of influenza already

MIG News, 28 October 2009, 13:39
https://web.archive.org/web/20091102070251/http://mignews.com.ua/en/articles/376222.html

Flu epidemic in the Ternopil Region, which appeared a week ago, mowed down nearly 10,000 of residents. Moreover - unknown virus has already killed seven people. Two residents of the regional center and five villagers (among them was a woman who recently gave birth to a child) died from pneumonia caused by catarrhal infection. Another four people have been in the grace condition in hospitals of Ternopil.

As the head of public health city department Vasyl Blykhar reported, all victims of infection were young people who previously had no problems with health. Supposedly they sought help too late, on the sixth or seven day. Quarantine is declared in the region, schools are closed. They say infection is coming to the neighboring areas of Western Ukraine. In the Lviv Region a few districts are preparing for quarantine, particularly, Drohobych and Boryslav districts.

As a resident of Ternopil Olexandra Melys toldh, a lot of people wearing flu masks have appeared in the city. Ternopil residents are buying garlic, onion and vodka for prophylaxis. There are queues for pills and drops from a cold, there is lack of the most popular drugs, "- says a pensioner Lyudmila. - They say that in fact 16 people have already died".

Local residents fear swine flu mows down them. Doctors reassure: laboratory studies at the local level do not confirm that it is swine flu. "We will be able to confirm the type of influenza in 1,5 week, when research results will be received from London", - says Bohdan Onyskiv, the head of the regional health administration department. One reason for large-scale disease might be sudden cold snap, when a week ago Halychyna was covered with snow and frost. According to another version, wage earners, who brought the virus from abroad, are guilty of it.

The doctors do not rule out that the death of residents occurred precisely because of influenza. But only virology examination may confirm information about it. It will be made in Kyiv within 7-14 days. But the head of the Verkhovna Rada Committee on Health protection Tatiana Bakhteyeva said that the Ukrainian examination is not a guarantee: "Our labs have a weak foundation for such research and nobody can guarantee the results will be correct."

Experts say that officials of the Ministry of Health can keep silent about the situation in order not to sow panic. "We can not rule out that people could die from swine flu", says Professor of Immunology Fedor Lapy. According to him, 7 deaths in the region for a week is too much.

"The United States has declared a pandemic of swine flu, a thousand of people have already died. It is in the United States, where there is a vaccine, but we will have just plague", - adds the first deputy head of the Committee on Health Vyacheslav Peredery.

01:56 p.m. Information about the death of four people as a result of complications of influenza has come also from the Drohobych district, Lviv Region. As the head of the Health protection Department of Drohobych city executive committee Andriy Shevkenych, this is due, first of all, with ill-timed treatment in a medical institution, late hospitalization and self-treatment. "Only during the previous

day the ambulance received over 50 calls related to the symptoms of influenza. As a result, 11 people were hospitalized," - said Andriy Shevkenych.

Also, according to Andriy Shevkenych, a headquarters under the leadership of the Deputy Chairman of Drohobych, chairman of Staff has been founded for struggle against virus. Hr 100,000 have been allocated for struggle against flu. Quarantine is declared in schools and kindergartens quarantined. Additional seats are assigned in children's hospitals of Drohobych Stebnyk.

"In my opinion, this is the peak. We will hope for decrease in number of cases in a week", - said Andriy Shevkenych.

The Ministry of Health reported that a commission has been founded involving experts from ministries and scientists from the Academy of Medical Sciences in order to study the causes of increasing influenza and acute respiratory viral infections in the Ternopil Region.

05:03 p.m. Chairman of the Ternopil Regional State Administration Yuri Chyzhmar signed a decree on October 28 to allocate from the reserve Hr 50,000 funds of the regional budget for the purchase of tools for diagnosis influenza and acute respiratory viral infections.

In general population of Ternopil and southern regions of the region, in particular Chertkovsky, Terebovlya, Husyatinsky, Borshchevsky, are ill. Patients who died had not visited countries affected by A (H1N1) "California" flu and lived in various parts of the region.

Despite the fact that unknown virus is raging in Western Ukraine, which is killing people, the Health Minister Vasyl Kniazevych says everything is under control. He said today at a press briefing in the Cabinet of Ministers of Ukraine that in connection with epidemic of acute respiratory infections in the Ternopil Region the Ministry of Health created a special headquarters. He sent the chief sanitary doctor of Ukraine to Ternopil.

The head of the Ministry of Health confirmed that as a result of the epidemic of influenza 9 people died (in the Ternopil Region - editor.), who were diagnosed with "pneumonia". 95 people have been registered with similar diagnosis and hospitalized in the Ternopil Region.

According to Vasyl Kniazevych, 25 people who are ill with pneumonia are now in the grave condition (among them are children, but most of them are adults). An express-diagnostics and laboratory studies of all diseased are done. "The virus H1N1 has not been confirmed", - assured Minister of Health and urged people not to panic and not to create excitement. "Call a doctor and let him help you", he added.

Ministry of Health has confirmed 20 deaths from pneumonia in Ternopil, Ivano-Frankivsk and Lviv Regions, deputy Minister of Health Vasyl Lazoryshynets reported at a press conference.

He said that in the Ternopil region since October 13 95 people have been hospitalized with such diagnosis, 25 of them are in the grave condition, and 10 patients died. In the Ivano-Frankivsk Region since the same time 25 people with the same diagnosis have been hospitalized, 7 of them - in a grave condition, 6 people died. In the Lviv Region since October 1 6 patients have been hospitalized, 2 of them are in a grave condition, 4 people died. By Segodnya newspaper, Ukrainian News

OBOZ.UA

Нетипова пневмонія добралася до Чернівців і Рівне

Oglyadach, 29 жовтня 2009, 15:02
https://web.archive.org/web/20091105074538/http://www.oglyadach.com/news/2009/10/29/214854.htm

У Чернівцях зареєстрований перший випадок смерті хворого на пневмонію. Медики не виключають, що мають справу з раніше невідомим вірусом.

«Хвору дівчину госпіталізували у вкрай важкому стані», - повідомив головний лікар міської клінічної лікарні №3 Віктор Світун. За його словами, відразу ж був скликаний консиліум за участю якнайкращих фахівців. У хворої виявили легеневу недостатність, лікарям не вдалося її врятувати.

За словами батьків дівчини, вона хворіла вже 4 - 5 днів звичайною простудою. Але такого швидкого розвитку пневмонії в Чернівцях ще не було.

«По даному випадку було проведено епідеміологічне розслідування, яке не підтвердило наявність вірусів ОРЗ і грипу», - сказав завідувач епідеміологічним відділом Чернівецької обласної санітарно-епідеміологічної станції Юрій Падурару.

Лікарі допускають, що пневмонія є рецидивом ГРВІ і грипу або невідомого раніше вірусу. Симптоми ходу захворювання - швидкий розвиток пневмонії, відсутність нежиті і кашлю. Саме з такими симптомами, за неофіційною інформацією, в місті померли ще дві людини.

Міністерство охорони здоров'я України заявляє, що в жовтні в західних областях України, за попередніми даними, саме від пневмонії померли 20 людей, але багато хто побоюється, що причина цьому – свинячий грип.

Мінохоронздоров'я, тим часом, закликає всіх громадян у разі появи симптомів грипу або інших гострих респіраторних вірусних захворювань негайно звертатися до лікарів.

Як передає УНІАН, про це міністр охорони здоров'я України Василь Князевич заявив сьогодні, на засіданні уряду.

«Лікарі знають, як надавати допомогу, але є проблема вчасного звертання до лікаря. Зараз нам потрібно дуже інтенсивно працювати з населенням. Паніки тут не повинно бути. По-перше, звернення до лікаря, а у лікаря – відповідний алгоритм роботи», - сказав Князевич.

Міністр також вважає необхідним звернутися до керівників підприємств з проханням «відпускати людей, які погано себе почувають».

«Потрібно хворих людей ізолювати, а вдома з ними можуть працювати лікарі. Це кращий вихід, як запобігти розповсюдженню епідемії», - додав Князевич.

У свою чергу прем'єр-міністр України Юлія Тимошенко доручила підготувати необхідне звернення до громадян із закликом вчасного звертання до лікарів.

Втім іноді звернення в медструктури може не вплинути на хід хвороби. Так одна з мешканок «хворіючої» Тернопільської області розповіла ЗМІ, що коли захворіла, лікаря їй довелося чекати два дні.

При тому, що головні охоронці здоров’я країни кажуть, що саме пізнє звернення до лікарів є причиною ускладнень, які можуть мати летальний результат, а в Тернопільській області, тим часом, офіційно підтверджено вже 10 смертей, повідомляє NEWSru.ua.

Крім того, як стало відомо, сьогодні вночі в реанімаційному відділенні Рівненської обласної лікарні помер співробітник місцевого телебачення "СФЕРА-ТБ" Руслан Гурмак.

Гурмак був родом з міста Коломия, де працював телеоператором на місцевому телебаченні, одружився на мешканці міста Рівне, переїхав жити в це місто. Тут творчий шлях телеоператор продовжив на рівненському телеканалі "СФЕРА-ТБ". За плечима Руслана – служба в армії в аеромобільних військах міста Львова.

Тим часом влада міста Рівне звернулася до керівників трудових колективів із закликом провести профілактичні щеплення проти грипу. "За прогнозами Всесвітньої організації охорони здоров'я, цього року в Україні очікується штам сезонного грипу "Брізбен". Особливість цього штаму в тому, що він може накластися на пандемічний штам "Каліфорнія" (N1H1). Людина може перехворіти трьома штамами: "Брізбен А", "Брізбен В", "N1H1 Каліфорнія" (свинячий грип). Найефективнішим методом захисту є профілактичні щеплення" - мовиться в зверненні.

За даними рівненських медиків, досвід вакцинації минулого епідемічного сезону свідчить про високу ефективність профілактики цієї хвороби, яка часто дає важкі ускладнення, пише ZIK

OBOZ.UA

У Тернополі понад 300 людей госпіталізовані з пневмонією

Oglyadach, 29 жовтня 2009, 15:16
https://web.archive.org/web/20091104041526/http://www.oglyadach.com/news/2009/10/29/214857.htm

На Тернопільщині за добу кількість госпіталізованих з попереднім діагнозом “пневмонія” збільшилась у 2,5 рази.

Про це під час сьогоднішнього засідання колегії Тернопільської облдержадміністрації повідомив начальник Управління охорони здоров’я ОДА Богдан Ониськів.

За його даними, станом на 8.00 29 жовтня в медичних закладах перебувало 326 хворих із попереднім діагнозом позалікарняна пневмонія, спричинена гострим респіраторним захворюванням, із них у тяжкому стані 22 особи. 55 із числа госпіталізованих – діти.

Для надання медичної допомоги, за словами Ониськіва, перепрофільовані ліжка в лікарні швидкої допомоги, обласній клінічній лікарні, для вагітних жінок організовано діагностичне відділення на базі міської лікарні №2 та дитячої лікарні.

“Також вирішується питання виділення приміщення медсанчастини Комбайнового заводу для організації резервної інфекційної лікарні у випадку масового надходження хворих”, – повідомив Ониськів.

information is power

Unidentified flue outbreak in Western Ukraine

ZiK, 29 October 2009, 19:48
https://web.archive.org/web/20091101012920/http://zik.com.ua/en/news/2009/10/29/202374

Western Ukraine was hit by a severe epidemic of unidentified influenza, tentatively diagnosed by doctors as viral pneumonia. The number of dead has climbed dramatically. Doctors advise Western Ukrainians to stay at home and use preventive medication. The first pedestrians wearing face masks have been seen on Lviv streets

Lviv kindergartens and schools have been closed, and the city council is to have its emergency session soon to address the flue outbreak. So far, the information released by the authorities on the epidemic dimensions spread and preventive measures is scarce, causing panic to spread in the city.

Here are the latest reports on the situation in other W.Ukraine oblasts:

Ternopil oblast

As the number of sick persons increases, the authorities describe the situation as rather serious, says Ternopil oblast chief medical officer Bohdan Onyskiv.

"In all, 262 patients are treated in hospitals, of these 16 in serious condition. – [x] children have died in rural areas and 70 in Ternopil," he says. Onyskiv confirmed that they died from viral pneumonia.

The main cause of their death is that sick Ukrainians were too late requesting medical help, most of them on the 5th or 6th day of the disease. They stayed at home, trying to treat themselves, visiting hospitals when it was too late. The disease has a distinct viral nature, complicating treatment, he added.

Lviv Oblast

Five persons have died from the flue in Lviv, four men and one woman, says emergency hospital chief doctor Myron Borysevych.

Two of the dead patients were in the 22-35 age group, with 2 others over 60. He diagnosed the disease as viral pneumonia.

"We have sent the analyses to Kyiv. We don't believe it's the swine flue. Neither do we know what kind of pneumonia it is,

Borysevych stressed. Viral tests can last from one to two weeks. They are complicated and not done in Lviv. The course of the disease was very quick. The symptoms included very high temperature and short-wind cough.

The disease started as an ordinary chill with headache and temperature. The symptoms lasted for a week before patient condition began to aggravate.

Zakarpattya Oblast

A man has died from the swine flue in Volovets. He has recently returned from Saint Petersburg, Russia, suffering from a cold. He was rushed to the hospital when pneumonia symptoms were found by doctors. Another local who came from Moscow became sick and went to see his doctor in time. Now he is recovering safely.

Ivano-Frankivsk Oblast

All the six dead young people had symptoms of severe hemmorhagic pneumonia. The disease starts slowly, with temperature rising to 37.2 – 37.3 degrees, slight cough and pain in joints. Nasal catarrh developed at the end of the second or third day. Autopsy revealed that the lungs were soaked with blood, the oblast chief specialist said.

Chernivtsi Oblast

The number of persons with common flue in Chernivtsi has grown from 2,623 to 4,053. According to the local medical authorities, the city has been hit by an unknown type of the flue. The tests to identify the virus will be ready only in 2 weeks, doctors say.

Swine flu fears on rise after numerous deaths

Kyiv Post, 29 October 2009, 22:27
https://web.archive.org/web/20091102053244/https://www.kyivpost.com/news/nation/detail/51513/

The Health Ministry is trying to identify the deadly virus that has killed at least 30 people in western Ukraine so far.

An unknown virus is afflicting thousands in western Ukraine, according to health authorities who say at least 30 people have died this month alone from the mysterious ailment. The death toll is expected to grow higher soon.

As of Oct. 29, Ukraine's Health Ministry had not yet determined whether the recent deaths are related to the global outbreak of the H1N1 "swine flu" virus, but they admitted to sending more than 1,200 doses of Tamiflu, the antiviral drug used to treat H1N1, to western Ukraine.

Thus far, there have been only two confirmed cases of swine flu in Ukraine, according to health officials, who have expressed confidence that the country is ready to combat the virus should an outbreak occur. But fears about the possible onset of a swine flu pandemic in Ukraine increased on Oct. 27 after media reported that a man from Zakarpattya Oblast had died of swine flu complications. The diagnosis has not been confirmed.

"Ukraine's Health Ministry has convened an emergency team to identify the virus and identify measures to prevent it from spreading," Health Minister Vasyl Knyazevych said on Oct. 29 during a cabinet meeting.

"Specialists on the team are working around the clock and we are confident that we will be able to identify the cause [of the deaths] on Monday or Tuesday next week and announce preventative measures," Knyazevych said.

"Some 10 people have perished in Ternopil Oblast, and several in the Lviv and Ivano-Frankivsk oblasts," Deputy Health Minister Oleksandr Bilovol said a day earlier during a press conference in Kyiv. He added that all victims were less than 45 years of age.

"The individuals died of viral pneumonia, the cause of which we have not yet determined," said Bilovol, adding that health officials are awaiting the results of laboratory tests. "According to our data, the number of deaths due to viral pneumonia is a little higher than last year."

More than 6,000 people in Ukraine died of pneumonia in 2008, according to Health Ministry statistics, with 400 fatalities registered in the Ternopil, Lviv and Ivano-Frankivsk oblasts.

Bilovol said during the press conference that 34 individuals of the 160 patients currently afflicted are in critical condition. He said that most of the people who died waited too long – one week – before seeking medical assistance.

Health officials say they will need several days to determine whether the cases are, indeed, swine flu. In neighboring Russia, meanwhile, the H1N1 virus is definitely making the rounds. Since June, about 1,300 cases of H1N1 have been registered in Russia by health officials, who have urged people not to panic.

"Two women are believed to have died of the influenza A/H1N1 virus," a spokesman for eastern Siberia's Chita region said on Oct. 27, adding that official confirmation of the causes of death would only be available in 21 days.

As of Oct. 29, the number of patients in the region diagnosed with swine flu grew to 251, according to Natalya Zhdanova, deputy governor of Chita region. She said seven patients were critically ill.

Ukraine has set up a laboratory that can test for the H1N1 virus and more test kits are planned to be purchased. Ukraine's strategy has been to contain the H1N1 virus and impede its spread among the population by surveillance in airports and train stations.

The H1N1 virus is not usually deadly, but spreads more quickly than usual flu because it's a new virus against which people have not yet built immunity.

According to the World Health Organization, 2 percent of patients sick with H1N1 come to hospitals with complications. People with lung and heart conditions, diabetes, obesity, pregnant women, elderly and very young children are in the high-risk groups.

U.S. President Barack Obama on Oct. 25 declared a national emergency as the estimated number of swine flu cases topped one million. During a visit to Ukraine weeks ago, U.S. health officials urged their Ukrainian counterparts to boost preparations for combating a possible H1N1 epidemic, warning that it's only a matter of time before the country would be hit. Experts have also expressed concern about the ability of Ukraine's dilapidated and under-financed health system to contain a serious outbreak.

Radio Netherlands Worldwide

Mysterious virus hits Ukraine

Radio Netherlands Worldwide, 29 October 2009, 11:07pm
https://web.archive.org/web/20091102063526/http://www.rnw.nl/english/article/mysterious-virus-hits-ukraine

A viral infection has killed 30 people in Ukraine

The illness begins as an ordinary bout of flu, but after a week the symptoms get worse.

Almost 40,000 Ukrainians have contracted the disease. Around 100 are in hospital.

In the west of the country there has been a run on virus inhibitors and surgical masks. Schools and childcare centres in the city of Lvov are closed.

Test are being carried out to establish what kind of virus is causing the sickness. The H1N1 virus which causes Mexican flu has been ruled out.

Mysteriöse Krankheit rafft 30 Menschen hin

20 Min On Line, 29 October 2009
https://www.20min.ch/story/mysterioese-krankheit-rafft-30-menschen-hin-874153482671

Mehr als 30 Menschen sind im Westen der Ukraine an den Folgen einer mysteriösen Lungenentzündung gestorben. Der Ursprung der Krankheit ist laut Gesundheitsministerium noch unbekannt.

Besonders betroffen seien die Regionen von Ternopil und Lwiw, wo seit Beginn des Monats jeweils mindestens zwölf Menschen gestorben seien. Sechs Menschen seien in der Region Iwano-Frankiwsk gestorben.

In den drei Regionen seien 37 900 Menschen von Viruserkrankungen der Atemwege betroffen. 951 Menschen würden in Spitälern behandelt, unter ihnen seien 30 Erwachsene und 31 Kinder, die auf der Intensivstation lägen.

Fast 40 000 erkrankt

In allen Regionen wurden vorläufig die Kindergärten und Schulen geschlossen. Den Universitäten wurde empfohlen, den Unterricht auszusetzen.

Aus Sorge vor der Krankheit kauften Menschen vielerorts Vorräte an antiviralen Medikamente und trugen Schutzmasken. In der Stadt Lwiw bildeten sich vor den Apotheken, die noch über solche Medikamente verfügten, meterlange Schlangen, wie ein AFP-Reporter berichtete. In der Stadt Drogobytsch wurde auch die Schliessung aller Diskotheken angeordnet.

THE FLU CASE

Origin of new virus in Ukraine unknown, says Government

The Flu Case, 30 October 2009
https://web.archive.org/web/20091103080745/http://www.theflucase.com/index.php?option=com_content&view=article&id=1459:origin-of-new-virus-in-ukraine-unknown-says-government&catid=1:latest-news&Itemid=64&lang=en

More than 30 people have died in the Ukraine as a result of a mysterious new virus that has an affinty for the lungs, according to reports in Switzerland.

The Ukranian Health Ministry has said that the origin of the virus is unknown, but its affinity for the lungs and the way it attacks young people strongly suggests it is a virulent form of the H1N1"swine flu" virus.

WHO recently confirmed that the H1N1 virus showed no signs of mutating to become more virulent. The emergence of this virulent strain could, therefore, be linked with the activities of scientists, such as Professor Bruno Lina in France, who was actively searching for a virulence gene.

Almost 40,000 people have fallen sick with 951 people having to be hospitalised.

ХВИЛЯ

На украино-польской границе вводится специальный пропускной режим

ХВИЛЯ, 29 октября 2009, 16:28:39
https://hvylya.net/news/digest/2009-10-29-16-30-51.html
https://hvylya.net/uk/news/1856-2009-10-29-16-30-51

Об этом 29 октября ZAXID.NET сообщил начальник пресс-службы Западного регионального управления Государственной пограничной службы Украины Владимир Шеремета.

В.Шеремета заявил, что пункты пропуска будут работать в таком же режиме, как работали, когда была угроза «птичьего» гриппа. «Есть распоряжение руководства Государственной пограничной службы о необходимости реализации мероприятий по противодействию распространению вируса гриппа А (H1N1). Поэтому во всех пунктах пропуска на западной границе людей, что въезжают на территорию Украины, сначала будут проверять медики. Лишь после этого могут работать пограничники, потом таможенники», — прокомментировал он.

В.Шеремета прибавил, что для сохранения здоровья и жизни пограничников, предотвращение распространения ОРВИ, они уже несут службу в защитных масках.

Григорович убеждена в необходимости введения ЧП в 5 областях

Инт-Газета: Эксперт-Центр, 30 октября 2009, 05:31
https://expert.org.ua/chp/2009/grigorovich-ubezhdena-v-neobhodimosti-vvedeniya-chp-v-5-oblastyah

Член комитета Верховной Рады по вопросам здравоохранения Лилия Григорович (фракция НУ-НС) убеждена в необходимости введения чрезвычайного положения в пяти областях Украины.

"Совокупность показателей, которые мы имеем, - внезапные, многочисленные смерти больных, резкая динамика количества пострадавших от этой эпидемии - дает основания для введения чрезвычайного положения", - цитирует Л.Григорович пресс-служба партии "Наша Украина" в четверг, сообщает Интерфакс-Украина.

"Мы уже имеем 16 смертей в Тернополе, 10 - во Львове, 6 - в Ивано-Франковске. Есть данные о распространении эпидемии в других областях, в частности, в Черновицкой и Ровенской", - подчеркнула депутат.

Л.Григорович отметила, что президент США Барак Обама "ввел чрезвычайное положение в Штатах, когда погибли три человека".

"Если для того, чтобы эпидемия не распространялась, чтобы можно было сохранить человеческие жизни, локализовать ситуацию, нужно вводить чрезвычайное положение, тогда нужно это делать немедленно", - резюмировала депутат.

Number of victims to unknown virus growing! State of emergency to be imposed in Ukraine?

MIG News, 30 October 2009, 10:25
https://web.archive.org/web/20091102052604/http://mignews.com.ua/en/articles/376537.html

Yesterday, on October 29 some media reported that allegedly in the Ternopil Region cases of ill people with typhus were registered, and that militarized detachments limited entrance and departure from the territory of the Ternopil Region. However, the Public Relations Center of the Ministry of Emergencies in the Ternopil Region denied information about it.

Yesterday, on October 29 the chief physician of the regional sanitary-epidemiological station Halyna Hrynchuk assured that Kyiv Region is ready for prophylaxis and treatment of influenza, reported Yulia Makoveeva, MIGnews.com.ua correspondent.

In the Ternopil Region 25 percents of infectiologists who worked with patients with acute respiratory viral infections are ill, the chairman of the Association of infectiologists of Ukraine Mykhaylo Andreychin reported yesterday, on October 29 at a press conference.

"One fourth of doctors had such a disease or they are ill with it now. Fortunately, they are recovering now and soon again be able to work", - said Mykhaylo Andreychin.

Yesterday, on October 29 in Morshyn, Lviv Region a doctor from a local hospital, who contacted with patients with viral infection and visited them, died, is reported by the Deputy Chief of the Health protection department in the Lviv Region Iryna Mykytchak. According to her, a 56-year-old woman "had been previously diagnosed with pneumonia," UNIAN reports.

The medical facilities in the Lviv region have medicines for treatment of influenza and acute respiratory infections for the three-day supply, is said in the summary of information of the General Directorate of Health Protection in the Lviv Regional at the State regional Administration, UNIAN reported.

Because of the mass acute respiratory infections residents of the Lviv Region began to buy up antiviral drugs and flu masks. Yesterday, on October 29 the Lviv residents could not purchase masks. Consequently, the director general of the Lviv regional pharmaceutical corporation Nelia Byk appealed to all residents of the region with the request not to buy drugs without the need, Glavred cites the Ministry's report as saying.

Ministry of Health recommends using the methods of traditional and alternative medicine for prevention of acute respiratory viral diseases, including influenza, Ukrainian News cites the report of the Ministry as saying.

According to experts of Ministry of Health, filling nutrition, conditioning to the cold and frequent airing of premises are effective during the period of active disease. Also, the Ministry recommends using general health-improving and tonic immunomodulatory drugs. In addition, the Ministry recommends frequent hand washing and cover a nose and mouth with a handkerchief when coughing and sneezing.

The number of people suffering from unknown virus in Ukraine is growing. According to the latest data of Ministry of Health, 30 deaths of flu and acute respiratory viral diseases have been recorded, starting from October, 19, in the Ternopil, Ivano-Frankivsk and Lviv Regions. In particular, from October, 19 and until 04:00 p.m. on October 29 6 deaths have been recorded in the Ivano-Frankivsk Region, 12 - in the Lviv Region (including 1 child) and 12 - in the Ternopil Region. As

of 04:00 p.m. on October 29 the number of people sick with influenza and acute respiratory viral infections in these regions has reached 37, 923 people, 951 out of them have been hospitalized.

11:04 a.m. The information has been received that 3 people died from complicated pneumonia for the last 3 days in Chernivtsi. In total, during the last day the number of people sick with acute respiratory vital infections in Chernivtsi increased from 2,623 to 4,053 people. Only in 8 cases influenza was diagnosed.

According to the doctors, now in Chernivtsi unidentified viral infection is being observed. The first results of virological studies that will identify the virus, will be ready only in two weeks. Also, three people died in the Rivne Region, and one person- in Transcarpathia. In total, according to unconfirmed reports, 37 people died.

In connection with this anti-epidemic measures are introduced at the Lviv railway. A spokesman for the chairman of the Lviv regional state administration Olha Kulyk also reported that "Lviv airport and Lviv Customs are under control".

The Ternopil Regional Council decided to hold an extraordinary session on October 30. MPs will start the meeting at 02:00 p.m. today.

The emergency antiepidemic and antiepizootic Committee will be gathered today in the Cabinet of Ministers, declared First Deputy Prime Minister Olexander Turchynov in the air of 5 Kanal.

In addition, commenting on the growth of drug prices, he appealed to owners of pharmacies: "Stop be a parasite on the problems of citizens and do not play with the prices because we will have to answer for it. We are not joking, and we will act fairly tightly."

Olexander Turchynov also said that the leadership of the Ternopil Regional Health Protection Department "waited for a few weeks, did not informed the center and only after they had realized they would not cope with the situation, attended the press conference, instead of immediately informing Kyiv".

Poland is keeping an eye on the situation with a possible virus epidemic in Ukraine. But while the State Sanitary Inspectorate of the country (GIS) does not see reasons to limit or close traffic on the common border. According to the GIS, the inspection has instructed its offices in Rzeszow and Lublin strengthen sanitary control at checkpoints on the common border, as well as monitor the current situation. In addition, the service should inform travelers about the possible threat of the epidemic and prevent the need to immediately contact a doctor in case of symptoms appearing.

GIS representative noted that from October 31 to November 3 the number of Poles crossing the Polish-Ukrainian border, will increase because many people will visit the cemeteries in Ukraine.

Member of the Verkhovna Rada Committee on Health Lilia Hrihorovich (Our Ukraine-People's Self-Defense faction) is convinced of the necessity to declare the state of emergency in five regions of Ukraine. MP of the Verkhovna Rada from the Party of Regions faction, deputy chairman of the Verkhovna Rada Committee on Health Viktor Korzh says that the Ministry of Health is not ready to struggle against flu and acute respiratory viral infections epidemic.

Director of the Ukrainian Center for influenza and respiratory infections, the Ministry of Health of Ukraine Olexander Hrynevich is convinced that Ukraine needs a massive vaccination against influenza in connection with a high incidence of acute respiratory infections. By reports of Interfax-Ukraine, UNIAN, Ukrainian News, Ukrainskaya pravda

As a reminder, October 28 flu epidemic in the Ternopil Region, which had appeared a week ago, mowed down nearly 10,000 of residents. Moreover - unknown virus has already killed seven people. Ministry of Health has confirmed 20 deaths from pneumonia in Ternopil, Ivano-Frankivsk and Lviv Regions. A closed meeting has been held in Ivano-Frankivsk, at which participants agreed that epidemic of the so-called "pneumonic plague" is being spread throughout Ukraine. But the problem is its form is unknown, it is ATYPICAL nobody knows how to treat it.

Кабмин запретил массовые мероприятия и приостановил учебный процесс

Корреспондент.net, Украина, 30 октября 2009, 15:48
https://web.archive.org/web/20091101221619/http://korrespondent.net/video/ukraine/1013311

Кабинет министров ввел запрет на проведение массовых мероприятий по всей Украине в связи с угрозой эпидемии гриппа A(H1N1). Во всех учебных заведениях страны объявлены трехнедельные каникулы.

Кроме того, пресс-секретарь премьер-министра Марина Сорока объяснила, что карантинный режим вводится на территории девяти областей Украины, однако положение о трехнедельных каникулах во всех учебных заведениях касается всей Украины.

Кабмин выделил 500 миллионов гривен на борьбу с гриппом

Корреспондент.net, Украина, 30 октября 2009, 16:53
https://web.archive.org/web/20091101221625/http://korrespondent.net/video/ukraine/1013333

Кабинет министров Украины выделил 0,5 млрд гривен для закупки необходимых лекарств для лечения высокопатогенного гриппа, а также масок, аппаратов искусственного дыхания, которые будут доставлены в аптеки во всех областях.

Об этом сегодня, 30 октября, заявила премьер-министр Юлия Тимошенко на внеочередном заседании Кабинета министров по поводу эпидемической ситуации, которая сложилась в западных регионах Украины.

Number of victims to unknown virus growing!
State of emergency to be imposed in Ukraine?

Above Top Secret, 3 November 2009, 04:41 AM
https://www.abovetopsecret.com/forum/thread515093/pg90

Hi AD,

thanks for the update. Seems like most major western msm are playing this very quiet, if they mention it at all.

reply to post by cosmicpixie

Der Spiegel (which owns Spiegel on line) is a major and very reliable news weekly, based in Germany. It's their equivalent of "Time" magazine I guess we could say. Normally very high standards of journalism. Doesn't mean they'll always tell the whole story (but neither does "Time"), but it's better than most. Not a tabloid, at least. No "woman gives birth to chicken" type of stuff...

About the absence of "seasonal" flu... I'm not too strong on how the epidemiology would work, but have read that a more virulent (infectious) strain can "displace" the usual seasonal strain.

Meanwhile I can only go on what's happening where I am. It's pretty quiet on the flu front. Where I work, which is right in the center of Prague, we've not had any problems with higher-than-average absenteeism. In fact, it's below what it was around this time last year as far as I recall. Our staff are very reliable as a rule and only report sick when they really are.

No-one that I know has mentioned having the flu personally or in their family, and I don't recall any news reports of outbreaks here. I have no doubt that there would be some cases though.

We've only had one confirmed death from swine flu, a woman in her 30's who died on Oct 21 in Karlovy Vary. She had been ill with it for some time and had long had a serious heart condition.

Okay, I've just searched for any local or Slovak reports of a major outbreak and there's nothing that I could find. I did find a report from Slovakia that was released yesterday, which indicates they *are* experiencing seasonal flu, but nothing out of the ordinary.

I need a little while to prepare and post a translation.

В Украине началась эпидемия высокопатогенного гриппа A/H1N1

Инт-Газета: Эксперт-Центр, 30 октября 2009, 10:29
https://expert.org.ua/politika/2009/v-ukraine-nachalas-epidemiya-vysokopatogennogo-grippa-ah1n1

В Украине началась эпидемия высокопатогенного гриппа A/H1N1. Об этом в интервью УНИАН заявил министр здравоохранения Украины Василий Князевич.

По его словам, вчера в Тернополе, при участии ведущих специалистов, состоялось совещание.

"По предварительным результатам, мы констатируем, что Украина вошла в мировую пандемическую зону, и (в стране) начинается эпидемия Калифорнийского гриппа, или гриппа A/H1N1", - отметил В.Князевич.

Он добавил, что в стране будет создана чрезвычайная противоэпидемическая комиссия, приняты противоэпидемические, карантинные меры. "Я буду докладывать руководству государства о ситуации, которая вышла за пределы эпидемического порога. Наверное будут рассматриваться вопросы карантизации или продление каникул в школах и институтах. Мы будем обращаться к населению с рекомендациями ограничить посещение общественных собраний", - сказал В.Князевич.

Министр призвал население Украины не заниматься самолечением, а обращаться к врачам. "Люди умирали только потому, что не обращались своевременно к врачам. Больные вызывали врача на 5-7 день болезни, когда уже помочь человеку нельзя", - сказал В.Князевич.

На вопрос, знают ли украинские врачи, как именно лечить Калифорнийский грипп, или грипп A/H1N1, министр заверил, что наши медики вполне компетентны в этих вопросах. "Мы очень активно сейчас работаем с врачами. Минздрав утвердил протоколы лечения, что делать, как оказывать помощь", - сказал В.Князевич.

ПОДРОБИЦІ

В Украине началась эпидемия "свиного" гриппа
Стране грозит карантин

Подробиці, 30 жовтня 2009 10:46
https://podrobnosti.ua/640227-v-ukraine-nachalas-epidemija-svinogo-grippa-strane-grozit-karantin.html

В Украине зафиксирована эпидемия высокопатогенного гриппа A/H1N1. Об этом на сегодняшней пресс-конференции сообщил министр здравоохранения Василий Князевич.

"К сожалению, мы должны констатировать, что в Украине фактически началась эпидемия калифорнийского гриппа", - сказал он. По его словам, в двух лабораториях подтвердили этот диагноз - зафиксировано 11 случаев из 33 проб. Министерство здравоохранения планирует объявить карантин на всей территории Украины, сообщил министр.

"Мы рассматриваем возможность объявления карантина не только в западных областях, но и по всей стране, так как вирус распространяется чрезвычайно быстро", - сказал Василий Князевич.

Как сообщалось со ссылкой на данные оперативного штаба Министерства здравоохранения Украины, тридцать человек, в том числе один ребенок, умерли в Украине в результате острых респираторных заболеваний в период с 19 октября.

По данным Минздрава, во Львовской области - 12 жертв, в том числе один ребенок, в Тернопольской - 12, в Ивано-Франковской умерли 6 человек. Кроме того, по данным СМИ, жертвы есть также Черновицкой, Ровенской и Закарпатской областях - всего умерли 34 человека.

Медики допускают, что причина смерти - стремительное развитие атипичной пневмонии. В то же время не исключается возможность вируса "свиного" гриппа.

Ранее в Украине были официально подтверждены 2 случая свиного гриппа. 5 июня 2009 года лаборатория в Лондоне подтвердила заболевание гриппом A/H1N1 у украинца, прибывшего из Парижа. До этого он проживал в Детройте (США), работал продавцом в овощном магазине. После лечения пациент отправился домой, в Черновцы. Кроме того, в конце сентября у мужчины, который прибыл из Кировоградской области в Киев и был госпитализирован с диагнозом "пневмония", подтверждена принадлежность выделенного штамма вируса гриппа к типу A/H1N1.

Ранее сообщалось, что министр здравоохранения Украины Василий Князевич подтвердил случаи гриппа A/H1N1 в Украине.

"Свиной" грипп подтвержден у одного из умерших (11:13)

Как минимум 1 человек умер в результате заражения свиным гриппом, сообщила руководитель пресс-службы Министерства здравоохранение Людмила Гордон в пятницу.

"Как минимум 1 случай, из 30 умерших, подтвержден. Дело в том, что мазок на пробу необходимо брать в первые часы заболевания, максимум до трех дней, а все они (умершие) обратились к врачу уже на 4-7 день болезни", - сказала она.

СНБО собирается на внеочередное заседание по гриппу (11.14)

Совет национальной безопасности и обороны проведет в пятницу внеочередное заседание по эпидемиологической ситуации в Украине. Начало заседания СНБО запланировано на 13:30.

Ющенко поручил Тимошенко обеспечить мониторинг распространения гриппа (11.32)

Президент Украины Виктор Ющенко просит премьер-министра Украины Юлию Тимошенко обеспечить выделение из государственного бюджета средств в необходимых объемах для организации постоянного мониторинга за распространением вирусов гриппа, в том числе гриппа A/H1N1, а также для обеспечения надлежащей деятельности вирусологических лабораторий государственной санитарно-эпидемиологической службы Украины и заведений здравоохранения на территории всех регионов Украины.

Президент просит также обеспечить безотлагательное рассмотрение текущей ситуации с заболеваемостью гриппом и острыми респираторными вирусными заболеваниями Государственной чрезвычайной противоэпидемической комиссией при Кабинете министров Украины с целью принятия соответствующего плана действий.

Балога: Ющенко должен ввести в западных регионах ЧП (11.56)

Бывший глава Секретариата президента Виктор Балога выступает за введение чрезвычайного положения в западных регионах из-за смертей людей от гриппа и острых респираторных вирусных инфекций.

Балога считает, что одним из решений заседания СНБО в пятницу должно быть введение в западных областях режима чрезвычайного эпидемиологического состояния. При этом Балога считает, что президент Виктор Ющенко должен ввести такое решение СНБО в действие безотлагательно.

В Тернополе ночью дезинфицировали воздух

Инт-Газета: Эксперт-Центр, 30 октября 2009, 11:40
https://expert.org.ua/obshchestvo/2009/v-ternopole-nochyu-dezinficirovali-vozduh

В Тернополе ночью на улицах проводили дезинфекцию воздуха. Об этом рассказал ректор Тернопольского педагогического университета Владимир Кравець, пишет ZAXID.NET. По его словам, о таких предохранительных мерах ему сообщили в милиции.

«В среду поздно вечером ко мне звонит по телефону солидный человек. Работает в милиции. Говорит - «Вы на ночь закройте все окна. Потому что Тернополь ночью будут обрызгивать из самолетов специальным раствором. В городе - тиф», - рассказал Портной.

Напомним, что во время вчерашней пресс-конференции председатель Тернопольской ОГА Юрий Чижмарь опроверг информацию о том, что вчера ночью проводили дезинфекцию Тернополя с воздуха. «Нет. Слухов было порождено много. Но могу вас заверить, что ни одного обрызгивания не было», - заверил губернатор.

С 29 октября на западной границе Украины вводится спецрежим

Инт-Газета: Эксперт-Центр, 30 октября 2009, 11:42
https://expert.org.ua/obshchestvo/2009/s-29-oktyabrya-na-zapadnoy-granice-ukrainy-vvoditsya-specrezhim

С 29 октября в пунктах пропуска на западной границе Украины вводится специальный режим работы в связи со вспышкой эпидемии ОРВИ, и угрозой проникновения на территорию Украины свиного гриппа. Об этом сообщил начальник пресс-службы Западного регионального управления Государственной пограничной службы Украины Владимир Шеремета, сообщает ZAXID.NET.

Шеремета поинформировал, что пункты пропуска будут работать в таком же режиме, как работали, когда была угроза птичьего гриппа. «Есть распоряжение руководства Государственной пограничной службы о необходимости реализации мероприятий по противодействию распространения вируса гриппа А (H1N1). Поэтому во всех пунктах пропуска на западной границе людей, которые въезжают на территорию Украины, сначала будут проверять медики. Лишь после этого могут работать пограничники, потом таможенники», - прокомментировал он.

Шеремета прибавил, что для сохранения здоровья и жизни пограничников, предотвращения распространения ОРВИ, они уже несут службу в защитных масках.

Напомним, в Украине подтверждены случаи гриппа A/H1N1 Об этом сообщил министр здравоохранения Украины Василий Князевич.

СЕГОДНЯ

МОЗ готовится объявить карантин по всей Украине

Сегодня, 30 октября 2009, 12:27
https://ukraine.segodnya.ua/ukraine/moz-hotovitcja-objavit-karantin-po-vcej-ukraine-177407.html

Министерство здравоохранения планирует объявить карантин на всей территории Украины. Об этом на сегодняшней пресс-конференции сообщил министр здравоохранения Василий Князевич, передают "Подробности ".

Министр подтвердил, что в Украине зафиксирована эпидемия высокопатогенного гриппа A/H1N1.

"К сожалению, мы должны констатировать, что в Украине фактически началась эпидемия калифорнийского гриппа", – сказал он.

По его словам, в двух лабораториях подтвердили этот диагноз – зафиксировано 11 случаев из 33 проб.

"Мы рассматриваем возможность объявления карантина не только в западных областях, но и по всей стране, так как вирус распространяется чрезвычайно быстро", – сказал Князевич.

Как сообщалось со ссылкой на данные оперативного штаба Министерства здравоохранения Украины, тридцать человек, в том числе один ребенок, умерли в Украине в результате острых респираторных заболеваний в период с 19 октября.

По данным Минздрава, во Львовской области – 12 жертв, в том числе один ребенок, в Тернопольской – 12, в Ивано-Франковской умерли 6 человек.

Кроме того, по данным СМИ, жертвы есть также Черновицкой, Ровенской и Закарпатской областях – всего умерли 34 человека.

Медики допускают, что причина смерти – стремительное развитие атипичной пневмонии. В то же время, не исключается возможность вируса гриппа A/H1N1.

Украинцы против введения "прививочных паспортов"

Инт-Газета: Эксперт-Центр, 30 октября 2009, 12:56
https://expert.org.ua/obshchestvo/2009/ukraincy-protiv-vvedeniya-privivochnyh-pasportov

Украинцы против введения "прививочных паспортов". Об этом свидетельствуют результаты телефонного опроса на тему "Иммунопрофилактика в Украине", проведеного Институтом Горшенина.

Эксперты Института Горшенина обращают внимание, что большинство украинцев (61,5%) негативно относятся к тому факту, что Верховная Рада приняла Закон "Об утверждении Общегосударственной программы иммунопрофилактики и защиты населения от инфекционных болезней на 2009 - 2015 годы", который обязывает их делать прививки. При этом, "крайне негативно" относятся к этому закону 48,4%, а 13,1% - "скорее негативно".

Менее четверти опрошенных (24,3%) затруднились обозначить свою позицию по данному поводу, говорится в собщении института, переданном агентству УНИАН.

Подавляющее большинство граждан (82,9%) не поддерживают решение Верховной Рады о принятии закона, согласно которому детей не будут принимать в детские сады и школы без прививочного паспорта.

Противоположную точку зрения высказали только 6,7% респондентов, а каждый десятый опрошенный (10,4%) затруднился с оценкой данного решения ВР.

Около трети украинцев (35,9%) затруднились ответить на вопрос о том, улучшится ли их здоровье вследствие принятия нового закона и введения прививочных паспортов. Более четверти опрошенных (28,4%) считают, что в сфере иммунопрофилактики ничего не изменится, поскольку прививочные паспорта будут покупаться, а около четверти респондентов (25,4%) заявили, что здоровье людей, вероятнее всего, ухудшится из-за некачественных вакцин или их побочных эффектов.

Только каждый десятый респондент (10,3%) верит в то, что, в результате принятия нового закона, своевременной вакцинации, здоровье людей улучшится.

Телефонный опрос на тему "Иммунопрофилактика в Украине" был проведен Институтом Горшенина с 26 по 28 октября 2009 г.

Всего, согласно случайной выборке, было опрошено 1000 респондентов в возрасте от 18 лет, во всех областных центрах Украины.

Квотами были регион проживания, пол и возраст респондентов.

Погрешность репрезентативности исследования не превышает +/-3,2%.

В Украине определен самый высокий уровень опасности из-за гриппа

Инт-Газета: Эксперт-Центр, 30 октября 2009, 15:09
https://expert.org.ua/obshchestvo/2009/v-ukraine-opredelen-samyy-vysokiy-uroven-opasnosti-iz-za-grippa

Правительство на внеочередном заседании в пятницу определило третий уровень опасности для населения в условиях эпидемии гриппа A/H1N1 ("свиного" гриппа).

"Сегодня на заседании правительства... мы также установили третий уровень опасности", - сказала премьер-министр Украины Юлия Тимошенко на брифинге в пятницу.

Третий уровень опасности - самый высокий, пояснила Юлия Тимошенко.

В Украине лабораторно подтверждено 11 случаев заболевания гриппом A/H1N1 ("свиным" гриппом), заявила Юлия Тимошенко.

Правительство приняло специальное комплексное постановление о предотвращении распространения гриппа A/H1N1 в Украине, первым пунктом которого являются профилактические меры.

"Мы приняли специальное комплексное постановление правительства относительно предотвращения распространения инфекции на территории Украины. Что является номером один? Номером один являются профилактические меры для каждого человека без исключения", - сказала она после внеочередного заседания правительства в пятницу.

Кабинет министров Украины сегодня подписал все необходимые контракты с производителями медпрепаратов для поставки их в Украину.

Тимошенко отметила, что в течение прошлых суток со всеми производителями соответствующих лечебных средств, а также медицинского оборудования, которое необходимо для Украины, будут установлены контакты.

"Все контракты подписываются сегодня с утра и все необходимые дополнительные лекарственные препараты, все дополнительное оборудование и все, что нужно для профилактики, будет завозиться в течение недели в Украину в значительно больших объемах, чем это было сделано в первые месяцы, когда готовились к случаям проявления калифорнийского гриппа", - отметила она.

Напомним, что Министерство здравоохранения объявило эпидемию гриппа A/H1N1 в Украине, а Кабмин ввел карантин в 9 областях.

Кабинет министров ввел запрет на проведение массовых мероприятий и каникулы в учебных учреждениях на 3 недели. Движение железнодорожного транспорта в Украине будет ограничено.

"Регионы" требуют уволить Князевича за грипп

Инт-Газета: Эксперт-Центр, 30 октября 2009, 15:43
https://expert.org.ua/politika/2009/regiony-trebuyut-uvolit-knyazevicha-za-gripp

Партия регионов настаивает на необходимости уволить министра здравоохранения Василия Князевича в связи с эпидемией гриппа A/H1N1.

Об этом сообщил журналистам лидер Партии регионов, кандидат в президенты Виктор Янукович в пятницу в Харькове.

"Мы настаиваем на немедленной отставке Князевича и всех, кто имеет к этому отношение - заместителей, начальников отделов (министерства)", - сказал он.

Кроме того, ПР настаивает на необходимости немедленно закупить оборудование для диагностирования гриппа.

Партия считает необходимым также отчет органов здравоохранения перед местными советами о готовности к антиэпидемическим мерам.

В частности, речь должна идти об обеспечении нужд населения в противомикробных масках и лекарствах для лечения гриппа.

Янукович критикует Кабинет министров за неподготовленность к эпидемии гриппа A/H1N1.

"Уже полгода назад было известно о (возможной) эпидемии гриппа, но ничего не было сделано", - сказал он.

По словам Януковича, как и в случае с экономическим кризисом, правительство оказалось неготовым к вспышке заболевания.

"Могу провести аналогию между экономическим кризисом и эпидемией - и в том, и в другом случае власть была не готова и не готовилась, дезориентировала население, что ничего не будет", - сказал он.

Таким образом, считает Янукович, власти оставили украинцев во время эпидемии на произвол судьбы.

Напомним, что Министерство здравоохранения объявило эпидемию гриппа A/H1N1 в Украине, а Кабмин ввел карантин в 9 областях.

Кабинет министров ввел запрет на проведение массовых мероприятий и каникулы в учебных учреждениях на 3 недели. Движение железнодорожного транспорта в Украине будет ограничено.

Власти Киева опровергают распыление над городом средств против гриппа

Газета по Киевски, 30 октября 2009, 17:17
https://web.archive.org/web/20091101035551/http://mycityua.com/news/city/2009/10/30/171747.html

В Управлении по чрезвычайным ситуациям Деснянского района Киева опровергают сообщения о том, что в районе метро «Лесная» с помощью авиации распылялись средства против гриппа.

Ранее сегодня по городу циркулировали слухи о том, что над рынком около метро «Лесная» летает самолет, распыляющий некое средство от "свиного" гриппа. Позвонившие в редакцию «Газеты по-киевски» жители Лесного массива сообщали, что они либо их знакомые или родственники видели кружащий над здешним рынком самолет. Сообщалось также, что продавцам было рекомендовано находиться в палатках.

В администрации рынка «Лесной» решительно опровергли эту информацию.

В Госавиадминистрации корреспонденту «Газеты по-киевски» сообщили, что какие-либо разрешения на вылет в черте города самолетов малой авиации сегодня не выдавались.

Информацию о распылении средств против гриппа опровергли также в Главном управлении здравоохранения города.

Между тем, подобные слухи в настоящее время обсуждаются в интернете на форумах Львова, Тернополя и других городов. Суть та же: над городами с вертолетов и самолетов будут якобы распылять неизвестное средство от свиного гриппа. По FM-радиостанциям регулярно передают опровержения такой информации.

recombinomics

Ukraine Orders Mobile Military Hospitals for H1N1 Caseload

Recombinomics Commentary, 30 October 2009, 18:52
https://web.archive.org/web/20091102061825/http://www.recombinomics.com/News/10300902/Ukraine_Mobile_Hospitals.html

Ukrainian President Viktor Yushchenko ordered the Defense Ministry to prepare a mobile military hospitals.

According to an UNIAN correspondent, he told reporters.

V. Yushchenko said that today should provide the necessary number of places for patients.

The president said the Defense Ministry order for the deployment of mobile mobile hospitals, which will be raised if necessary.

Ukrainian President Viktor Yushchenko has said that drugs to combat pandemic influenza A/H1N1 long enough, but he would ask the world community, if the need arises for additional resources.

The above comments describe additional preparations for handling the growing number of hospitalized patients in the Ukraine. Local television and radio reports describe a doubling of reported cases (from 37,923 to over 80,000) in a 24 hour period, potentially taxing health care delivery. Some health care workers have also been infected.

Samples have been sent to London for analysis and a permanent link to WHO has been established. The situation appears to be quite fluid and transmission could be exacerbated by the upcoming holiday weekend.

ГАИ штрафует водителей без марлевых повязок

УНІАН, 30 октября 2009, 19:20

https://web.archive.org/web/20091103014747/http://unian.net/rus/news/news-344154.html

В Львовской области работники Госавтоинспекции штрафуют водителей без марлевых повязок.

Как передает корреспондент УНИАН, об этом сегодня в Тернополе во время совещания по обсуждению эпидемической ситуации в западном регионе сообщил председатель Львовской облгосадминистрации Николай Кмить.

Говоря о мероприятиях, осуществленных руководством области для предотвращения распространения заболеваемости, губернатор заметил, что “была проведена работа и с силовыми структурами”. “И видим, что порой они уже перегибают палку. Милиция штрафует водителей, которые ездят без масок”, - сказал Н.Кмить. При этом он не уточнил, речь идет обо всех водителях или лишь тех, которые обслуживают общественный транспорт.

Губернатор Львовской области также заметил, что в Львове помощь медицинским заведениям оказывают таксисты, которые в условиях ограниченного количества медицинского транспорта пошли навстречу областной власти.

“Мы так же, как и в Тернопольской области, провели общение со священнослужителями, чтобы они убедили прихожан в необходимость надевать маски во время богослужений, где есть скопление большого количества людей”, - добавил Н. Кмить.

Нові випадки захворювання на вірус грипу A/N1N1-каліфорнія серед українців

Прес-служба МОЗ України, 30 жовтня 2009
https://web.archive.org/web/20091104005437/http://www.moz.gov.ua/ua/main/press/?docID=13932

Міністр охорони здоров'я України Василь Князевич поінформував про підтвердження нових випадків вірусу грипу A/H1N1-каліфорнія серед українців. –

У МОЗ України відбувся брифінг Міністра охорони здоров'я України Василя Князевича, де представникам ЗМІ та громадськості було поінформовано про підтвердження нових випадків захворювання на грип A/H1N1-каліфорнія.

Брифінг проведено за підсумками візиту до західних областей України. «Україна ввійшла в епідемію грипу, так званого каліфорнійського грипу A/H1N1», - повідомив міністр.

Він зазначив, що станом на 29 жовтня в Інституті епідеміології та інфекційних хвороб ім. Л.В.Громашевського АМН України проведено аналіз відібраних 22 зразків матеріалу від хворих (м.Тернопіль). В 11 випадках підтверджено грип типу А, із них 7 – грип A/H1N1-каліфорнія.

Крім того, фахівцями лабораторії вірусології та СНІД Центральної санепідстанції МОЗ України досліджено матеріали ще 8 осіб (м.Львів) з попереднім клінічним діагнозом ГРВІ на наявність вірусу грипу A/H1N1. Із них 4 – позитивні на наявність вірусу грипу A/H1N1-каліфорнія (серед досліджених зразків 1 – матеріал померлого).

Василь Князевич повідомив, що сьогодні відбудеться засідання Кабінету міністрів України та РНБО, де на найвищому рівні обговорять проблеми з протистояння епідемії грипу, в тому числі розглянуть питання введення карантинних заходів.

МОЗ України звернулося до міжнародних організацій про консультативну допомогу та з проханням надати необхідну кількість вакцин від грипу A/H1N1-каліфорнія.

Василь Князевич повідомив, що Україна забезпечена противірусними препаратами у повному обсязі. Він також додав, що відвідав лікарні Тернопільської, Чернівецької областей та провів засідання за участі медиків, місцевої влади, студентів медвузів.

Міністр охорони здоров'я подякував всій медичній спільноті, яка сьогодні сумлінно виконує свій професійний обов'язок та знаходиться в епіцентрі епідемії, надаючи кваліфіковану допомогу хворим.

Василь Князевич закликав не вдаватися до паніки, максимально дотримуватись рекомендацій з профілактики гострих респіраторних інфекцій та вчасно звертатися по медичну допомогу.

{Chuck Penfold}

Swine flu hits Ukraine

Deutsche Welle, 30 October 2009
https://www.dw.com/en/ukraine-closes-schools-cancels-public-events-after-swine-flu-deaths/a-4841826

The stringent measures may affect the country's recently kicked-off presidential campaign, as well as two high-profile soccer games scheduled for next month.

Ukraine on Friday announced the implementation of some of Europe's toughest measures to combat swine flu, closing schools and cinemas and banning public gatherings for at least three weeks.

The moves ordered by Prime Minister Yulia Tymoshenko came after the country confirmed at least four swine flu-related deaths, Ukraine's first since the outbreak started in Mexico and the United States last April.

The government is also to implement a "special system" to limit unnecessary travel. It is reportedly considering a quarantine in the west of the country, where the virus has been concentrated, or possibly a quarantine of the entire country.

"The virus is spreading very fast," said Health Minister Vasyl Knyazevych.

Closures may disrupt presidential campaign, sporting events

The epidemic comes at an inopportune time for Ukraine's presidential candidates, who have recently kicked off campaigning ahead of the election on Jan. 17.

Tymoshenko, herself a presidential hopeful, said all pre-election events would be cancelled until the situation has stabilized.

Government officials are also reportedly in discussions with international soccer authorities to discuss whether the measures would affect two upcoming games in Ukraine.

The country is scheduled to host a UEFA Champions League match between Dynamo Kiev and Inter Milan next Wednesday and a World Cup qualifying match between Ukraine and Greece on Nov. 18.

The H1N1 swine flu virus has killed more than 5,700 people around the world since last April, according to the World Health Organization.

At least 281 people have died in Europe, where governments have started mass vaccination programs in preparation for the winter flu season.

Причиной гибели 30 человек на западе Украины стал "свиной грипп"

РБК, 30 октября 2009
https://www.rbc.ru/society/30/10/2009/5703d73d9a7947733180c27c

Причиной смерти 30 человек на западе Украины стал "свиной грипп", сообщает министр здравоохранения страны Василий Князевич. По его словам, тип вируса не могли установить несколько дней. По словам В.Князевича, в стране зафиксирована эпидемия высокопатогенного гриппа А (H1N1).

В Львовской области умерли 12 человек, в Ивано-Франковской области - 6 человек, в Тернопольской – 12. Ранее в Минздраве Украины сообщали, что от "свиного гриппа" на Украине умерли лишь двое.

Накануне начальник отдела охраны материнства Главного управления здравоохранения Львовской областной горадминистрации (ОГА) Ирина Микичак сообщила, что в Львовской области 10 человек умерли от пневмонии и 11 находятся в реанимации с диагнозом "пневмония".

В свою очередь главный государственный санитарный врач Александр Биловол заявил, что в Тернополе, Ивано-Франковске и Львове эпидемиологический порог по гриппу превышен, в частности в Тернопольском регионе - в 1,5 раза. Он добавил, что ситуация в Тернопольском районе является сложной, туда отправилась комиссия Минохраны здоровья, чтобы выяснить обстоятельства обострения эпидемиологической ситуации. Кроме того, А.Биловол призвал граждан при появлении у них симптомов ОРВИ и гриппа немедленно обращаться к врачу.

40,000 contract serious virus in Ukraine, kills 30

Digital Journal, 30 October 2009
https://web.archive.org/web/20091103114753/http://www.digitaljournal.com/article/281347

As the world enters the H1N1 season, another possible virus emerges as 30 people in the Eastern European country of Ukraine have died from this latest flu.

Each country is dealing with their own cases of the H1N1 swine flu and many have even taken the vaccination but is H1N1 the only flu out there? A viral infection in Ukraine has taken the lives of 30 people and at first it seemed like an ordinary flu but after a week the symptoms worsened.

Radio Netherlands Worldwide reports 40,000 Ukrainians have contracted the disease and at least 100 are in the hospital. Tests are currently being conducted and all is known is that it is not the H1N1 Swine Flu.

A large number of schools and childcare facilities are being shut down, especially in the city of Lvov. Also, government agencies are handing out surgical masks and gloves to people in the western part of Ukraine.

However, *Russia Today* is reporting that it is A/H1N1 or Californian Flu and the total number of deaths is closer to 40.

Prime Minister Timoshenko stated, “Express-tests cannot provide a hundred percent verification of the virus, they give only 50% accuracy. That’s why blood probes of those who died were sent to special laboratories for further testing. And only this morning it was confirmed that at least 11 deaths were caused by the A/H1N1 virus.”

The Ukrainian government is calling for international aid to help fight their epidemic and President Yushchenko believes the country needs more than $6 million to battle the epidemic(s).

Wolne Media have also reported that the symptoms have been diagnosed as pneumonia. Furthermore, four patients in the hospital in Lviv Oblast have been confirmed to have “very severe pneumonia” after contracting the influenza.

НОВОСТИ N

«Свиной» грипп в Украине: место битвы – транспорт

Новості N, 31 октября 2009, в 15:24
https://novosti-n.org/ukraine_articles/-Svynoj-grypp-v-Ukrayne-mesto-bytvi-transport-1538

Минздрав не исключает распространение «свиного» гриппа по всей территории Украины. Отечественный транспорт является слабым звеном среди противоэпидемиологических мер. Поэтому транспортники принимают экстренные превентивные мероприятия по нераспространению этого вируса.

Информация о выявлении «свиного гриппа» на территории Украины застал «маленьких українців» врасплох. С мая уже практически все забыли об этом заболевании и приготовились следить за предвыборной гонкой кандидатов в президенты страны. Но вирус не дал населению возможности расслабиться.

Впервые о выявлении калифорнийского гриппа штампа A/H1N1 (проще говоря «свиного» гриппа) заявил 30 октября министр здравоохранения Василий Князевич. «К сожалению, мы должны констатировать, что в Украине фактически началась эпидемия», - сказал он. На оперативно созванном внеочередном заседании Кабмина премьер-министр Юлия Тимошенко заявила, что в девяти западных областях Украины вводится карантин на три недели.

В Тернополе, эпицентре зоны распространения вируса, паника началась еще до заявления чиновников. По сообщениям тернопольского корреспондента UGMK.INFO, улицы города опустели, в школах и институтах объявлен карантин. По словам горожан, в ночное время над городом летают самолеты и вертолеты, которые распыляют в воздухе вещества, которые якобы убивают бактерии.

Сразу скажем, что официальной информации о такой мере защиты нет, однако тернопольчане утверждают, что на улице чувствуется сильный запах хлора. К тому же, в городе напряженная ситуация с медпрепаратами: в аптеках разобрали все лекарства и респираторы. В распространении опасного вируса горожане обвиняют местных «заробитчан».

Однако, по сообщению «Тернопольводоканала», в городе проводят плановую промывку водопроводных сетей. В связи с этим, в распределительной сети появилась вода с повышенным содержанием хлора.

По информации корреспондента UGMK.INFO во Львове, ситуация в городе напряженная, но более спокойная. Несмотря на вирусную опасность, многие горожане выходят на улицу без защитных масок. В целом, по данным Минздрава, на 30 октября количество заболевших в Украине составляет более 81 тыс. человек, среди которых 33,5 тыс. детей. Госпитализированы 2 тыс. 341 человек, из них 1 тыс. 100 детей. Зафиксировано 33 смертельных случая.

Кроме того, в Минздраве подчеркнули, что имеющаяся информация дает основания прогнозировать быстрое распространение инфекции на всю территорию Украины. Ожидается большое количество заболевших в короткий промежуток времени, с высоким процентом течения заболевания и количеством летальных случаев.

В таких условиях для противодействия распространения заболевания на другие области Украины и за ее пределами важную роль играют меры, принятые на транспорте страны. 30

октября в Минтранссвязи состоялось экстренное совещание по принятию срочных мер на железнодорожном, автомобильном, морском транспорте и в аэропортах в этом контексте.

В министерстве решили, что в первую очередь будет внедряться комплекс мероприятий на железной дороге, в аэропортах и морских портах, в которые заходят круизные суда, а также на предприятиях и учреждениях отрасли. В частности, будет усилен противоэпидемический режим, проведут дезинфекционные мероприятия в местах массового пребывания людей на этих объектах.

Транспортное ведомство уже направило обращения к губернаторам и мерам городов с просьбой проинформировать перевозчиков всех форм собственности, которые обеспечивают перевозку пассажиров на городских, пригородных и межобластных маршрутах, о необходимости проведения после каждого рейса дезинфекционной обработки салонов автобусов на автовокзалах, автостанциях и конечных остановках маршрутов. Аналогичные процедуры дезинфекции будут осуществляться во всех поездах. Соответствующие рекомендации направлены владельцам авиационных и судоходных компаний.

В каждой подотрасли транспорта будут работать оперативные штабы. В случае выявления заболевания или подозрения на заболевание гриппом типа A/H1N1 работники отрасли обязаны немедленно информировать территориальные заведения здравоохранения и санэпидемстанции.

Несмотря на обострение эпидемии, все поезда продолжают курсировать согласно действующему графику с сохранением всех остановок, сообщает «Укрзализныця». Если пассажир заболел в дороге, он может обратиться за медицинской помощью к проводнику или начальнику поезда. После предоставления первой помощи поездная бригада передаст информацию на ближайшую станцию, где есть медпункт, при необходимости и по желанию пассажира возможна госпитализация. Работники санитарно-контрольных, в т.ч. пограничных, пунктов опрашивают начальников всех поездов, которые пересекают границу Украины, относительно наличия больных пассажиров, в частности, с симптомами гриппа A/H1N1.

Повышенное внимание уделяется предупреждению заболеваний работников отрасли и безопасности работы обслуживающего персонала - проводникам, кассирам, водителям. Постоянно будет осуществляться медицинский (санитарный) послерейсовый осмотр экипажей судов, поездных бригад и другого персонала. Кроме того, активизированы все возможности отраслевых медицинских заведений для безотлагательного обслуживания лиц с признаками вирусного заболевания. Работники железных дорог, которые непосредственно контактируют с людьми, работают в масках. Несмотря на такие меры, на Львовской железной дороге с признаками вируса гриппа госпитализировано одного проводника поезда в Черновцах. Об этом сообщила пресс-секретарь ЛЖД Лилия Криницкая.

В целом, транспортное ведомство и «Укрзализныця» призывают всех граждан ограничить передвижение, по возможности не посещать места массового пребывания людей и воздерживаться от поездок, а при первых признаках вирусного заболевания оставаться дома и немедленно обращаться за медицинской помощью.

WHO Team to Investigate Ukraine H1N1 Outbreaks

Recombinomics Commentary, 30 October 2009, 23:43
http://www.recombinomics.com/News/10300903/Ukraine_WHO.html

Gregory Hartl said the team was being pulled together by the WHO's Global Outbreak Alert and Response Network, which goes by the acronym GOARN.

The team will travel early next week to the eastern European country, which has closed schools and banned public meetings in response to a spike in cases of acute respiratory illness believed to be H1N1.

"This is something that certainly needs investigating," Hartl said from Geneva.

He said the government of Ukraine is being forthcoming with information on the outbreak, which is said to centre on three regions in the western part of the country.

The above comments describe a WHO investigational team being formed in response to the outbreak in Ukraine (see map). Although the story is evolving, some reports describe a dramatic spread of the virus to 80,000 people, with as many as 100 fatalities. The early reports describing 100 fatalities mentioned 10,000 infections, which would create an alarming case fatality rate of 1%. The newer cases would lower the rate, assuming the most recent cases don't follow the pattern described in the first 10,000 cases.

Media reports included descriptions of blood filled lungs, raising visions of the 1918 pandemic, which also involved swine H1N1 that jumped to humans and was efficiently transmitted. Samples have already been sent to London for analysis, and immediate release of initial sequence data would be useful.

Small changes can have dramatic effects when viruses jump species, and the rapid spread of the H1N1 in western Ukraine is clearly cause for concern.

INFOWARS IRELAND

Panic in Ukraine,
Authorities deny aircraft are spraying aerosols over cities,
Martial Law expected

Info Wars Ireland // The Flu Case, 31 October 2009
https://web.archive.org/web/20091105021450/http://theflucase.com/index.php?option=com_content&view=article&id=1548:panic-in-ukraine-as-martial-law-looms-reports-infowars-ireland&catid=41:highlighted-news&Itemid=105&lang=en

Authorities in Kiev, Ukraine, deny spraying of "aerosolized medication" by aircraft over city.

The office of Emergency Response in the district of Desniansko, Kiev, are tonight (30th Oct.) strongly refuting reports that light aircraft were spraying a substance over the city intended to counter a "swine flu pandemic" in Ukraine.

It was reported that light aircraft were seen over the Forest market area of the city (close to the Forest metro station) and they were spraying an aerosol substance intended to "counter swine flu", this of course would constitute forced medication of the population.

The editors of local newspapers in Kiev received dozens of phone calls from concerned residents and shop owners in the Forest market area of the city reporting they had observed several light airplanes circling in the sky during the day spraying an unidentified aerosol into the atmosphere.

Retailers and local business people reported they were advised to "stay indoors" during the day by local authorities.

Local newspapers contacted government administrators in Kiev and were told that "no permission had been granted today (30th Oct.) for small aviation aircraft to fly within the city limits". Also local FM radio stations in Kiev were regularly refuting the reports during broadcasts today, apparently under duress from local authorities.

Reports of helicopters and light airplanes spraying aerosols over Kiev, Lviv, Ternopil, and other cities throughout Ukraine are tonight flooding online forums and websites, hundreds of people have verified the reports with their own eye-witness accounts.

On 30th October President Viktor Yushchenko ordered the Ministry of Defense to establish mobile military hospitals throughout Ukraine, to assist and provide "essential medications" to people with swine-flu. Yushchenko has also ordered medical personnel from the reserve defense forces to report for duty.

An order from President Yushchenko is expected soon that will effectively place Ukraine under "martial law".

"Due to the complex epidemiological situation in the western regions of Ukraine, where tens of thousands of people have become ill, thousands are in hospital, and dozens have died."

Nine regions of Ukraine have declared a quarantine around the country and public events have been banned (including the elections).The Clergy have been ordered not to hold any Church or religious services on Sundays or to gather a congregation for any reason whatsoever. Police are also enforcing the compulsory wearing of protective face masks, any driver caught not wearing a mask faces harsh legal penalties.

Earlier, health authorities in western Ukraine reported a "severe outbreak of *unidentified* Influenza, suspected by doctors to be a form of viral pneumonia". The disease has already claimed a number of lives in the region. In Lviv, schools have been closed and authorities are conducting emergency meetings to determine how to deal with the outbreak.

Swine flu deaths

Deutsche Welle, 31 October 2009
https://www.dw.com/en/german-swine-flu-death-toll-jumps/a-4842380

Several people in Germany died on Friday from the swine flu, including one woman who had been otherwise healthy. Swine flu-related deaths are on the rise around the world as the cold and flu season begins in earnest.

There were two confirmed deaths from H1N1, or the swine flu, on Friday, and a newspaper has reported one additional fatality, bringing the German death toll up to six.

One of these, a 48-year-old woman from Bonn, was the first to have succumbed to the flu despite enjoying otherwise good health.

The woman "had no known medical history which would explain such serious illness," said Bonn's University Hospital on Friday evening.

Where the woman was infected remains unclear.

Also dead were a five-year-old boy in the federal state of Saarland who was also suffering from pneumonia and, according to a newspaper report, a sixteen-year-old in Bavaria who was reportedly severely disabled.

All fatal cases of swine flu in Germany had, until Friday, been caused by complications associated with other illnesses or conditions. German authorities fear a surge in cases as the flu and cold season continues.

"There could be a second wave of pandemic influenza beginning in Germany," said director of the Institute of Hygiene and Public Health at the University Clinic in Bonn, Martin Exner.

However, most of the swine flu cases in Germany so far have been mild, he added.

A more dangerous flu season worldwide

In the past week, according to the World Health Organization, the number of swine flu-related deaths jumped up by 700, to more than 5,700.

Ukraine on Friday announced the implementation of some of Europe's toughest measures to combat swine flu, closing schools and cinemas and banning public gatherings for at least three weeks.

The moves ordered by Prime Minister Yulia Tymoshenko came after the country confirmed at least four swine flu-related deaths, Ukraine's first since the outbreak started in Mexico and the United States last April.

The Ukrainian government is also to implement a "special system" to limit unnecessary travel. It is reportedly considering a quarantine in the west of the country, where the virus has been concentrated, or possibly a quarantine of the entire country.

The World Health Organization's latest figures estimated that at least 281 had died from swine flu in Europe.

"With the number of cases that are currently emerging increasing, the number of severe cases is also growing," said the Robert Koch Institute, Germany's federal institution responsible for disease control and prevention, in a statement.

"Against this background, the observance of personal hygiene measures and vaccination, as an important prevention measure, is of particular importance."

THE FLU CASE

David Rothscum

Report: Has Baxter International released a biological weapon?

The Flu Case, 1 November 2009, 18:39
https://web.archive.org/web/20091105021337/http://www.theflucase.com/index.php?option=com_content&view=article&id=1534:has-baxter-international-released-a-biological-weapon&catid=41:highlighted-news&Itemid=105&lang=en

Evidence appears to suggest that Baxter International is responsible for a new deadly outbreak of viral pneumonia in Ukraine.

In February of 2009 Bloomberg reported that Baxter "accidentally" send vaccine material containing both live Avian bird flu and seasonal influenza to multiple laboratories worldwide. A laboratory decided to test the vaccine on it's ferrets, but the ferrets all unexpectedly died. It must be noted that Baxter has made a "mistake" like this before. Blood products produced by Baxter once containd HIV. Thousands of haemophiliacs died due to this, and many went on to infect their spouses.

Later in the year, a bizarre story emerged on the internet. The Huffington Post reported on a a man named Joseph Moshe who was arrested after a hours long standoff with the police because he had supposedly made threats against the White House. The man was able to withstand multiple rounds of tear gas.

However, the internet community was very skeptical of the true reasons behidn this man's arrest. Comments on the Huffington Post website immediately began pouring in about an unreported side to this story, namely that Joseph Moshe was a Mossad Agent specialized in biological warfare who called into a radio show to warn people about a biological weapn that was being made by Baxter international that would be spread through vaccine and would cause a plague upon it's release.

Although anyone can make a doomsday claim and we should never believe anyone (and it must be said that the Truth movement handled this well, the message was spread without being proclaimed as gospel) the amazing part about Moshe's claim was the location where Moshe said the biological weapon was being produced.

Moshe claimed that Baxter's laboratory in the Ukraine out of all places was creating this biological weapon. All of this came out in the beginning of August, which is more than 2 months before the situation that is currently unfolding. For Moshe to correctly name the country where a new epidemic would be unleashed, requires either inside information, or an incredible coincidence as anyone with a basic knowledge of statistics can confirm for himself.

Let us assume for a moment that every person on our planet has an equal chance of giving rise to a new lethal epidemic due to a virus that mutates as it spreads through his body. The Ukraine has 46 million inhabitants. The current estimated global population is about 6.7 billion. This means that if a new epidemic were to arise, the chance of this epidemic starting in the Ukraine would be 0.69%. However, it appears that this virus is a form of flu. This makes the odds of being right when guessing that a deadly flu is going to break out in the Ukraine even smaller. The reason for this is that back in early August the vast majority of influenza infections were found in different countries than the Ukraine. In fact, on 30 Oktober, Earthtimes reported that Ukraine had officially reported only two cases of swine flu, and no deaths, until last Friday. This deadly epidemic appears to have arrived out of nowhere in the Ukraine.

Moshe's biomed profile appears to confirm his position as a microbiologist. Furthermore, this page with Baxter's contact information for it's Ukraine office confirms that Baxter has a presence in the Ukraine.

It must also be noted that massive numbers of microbiologists have been dying bizarre deaths. This case of what appears to be a brave man who sacrificed it all to bring us this message may explain why so many microbiologists have been murdered. The fact that this man managed to predict an outbreak of highly lethal influenza in a place where we would least expect it, 2 months before it a actually occured, lends credence to his claim that Baxter International is responsible for the outbreak and shows that top microbiologists can pose a problem to the people responsible for this ongoing disaster.

This is a developing story, expect to see possible updates on David Rothscum Reports as more information on what is happening in Ukraine becomes available.

Update 1: For the purpose of keeping information from disappearing, I am going to mirror most information I can find on here.

Comments on the Huffington post website on an article about Moshe's arrest documenting his claim that the Influenza virus in a vaccine manufactured by Baxter in Ukraine replicates RNA from the 1918 flu and is meant as a bioweapon:

Update 2: The Ukrainian government wants to impose travel restrictions on people across the nation to stop the virus from spreading.

Update 3: According to the Huffington post comments I cited above, Dr. Moshe claimed that the virus used replicated RNA of the 1918 Spanish flu. Symptoms of the 1919 Flu include victims being drenched in blood:

American were familiar with the flu; it sent you to bed, made you miserable for 3 or 4 days with fever, muscle aches, and congestion, then left you shaky for about a week. It made millions sick, yet killed only the oldest, youngest, and most feeble.

The 1918 influenza was not the flu Americans were familiar with. It was a horror that turned victims bluish-black then drowned them with their own body fluids. the death toll was highest in the ages 15 to 40, those in the peak of health. The victims would be fine one minute and the next incapacitated, fever-racked, and delirious. Temperatures rose to 104-106 degrees, skin turned blue, purple, or deep brown from lack of oxygen. Massive pneumonia attacked the lungs, filling them with fluid; blood gushed from the nose. Death was quick, savage, and terrifying.

Compare this to reports that are coming out from Ukraine:

Five persons have died from the flue in Lviv, four men and one woman, says emergency hospital chief doctor Myron Borysevych.

Two of the dead patients were in the 22-35 age group, with 2 others over 60. He diagnosed the disease as viral pneumonia.

(...)

Viral tests can last from one to two weeks. They are complicated and not done in Lviv. The course of the disease was very quick. The symptoms included very high temperature and short-wind cough.

(...)

All the six dead young people had symptoms of severe hemmorhagic pneumonia. The disease starts slowly, with temperature rising to 37.2 – 37.3 degrees, slight cough and pain in joints. Nasal catarrh developed at the end of the second or third day. Autopsy revealed that the lungs were soaked with blood, the oblast chief specialist said.

THE FLU CASE

Yushchenko called on to help Ukraine: Unknown virus is killing people

The Flu Case, 1 November 2009, 23:39
https://web.archive.org/web/20091106015455/http://www.theflucase.com/index.php?option=com_content&view=article&id=1576:ukraine-unknown-virus-is-killing-people&catid=41:highlighted-news&Itemid=105&lang=en

In last 24 hours, an unknown virus (presumed pneumonic plague) infected another 37 thousand and killed 12 more people. The authorities deny that this is pneumonic plague, and insist that people die from influenza, pneumonia and ARI.

Meanwhile, an emergency message from the President of Ukraine to the international community to immediately help in the fight against the virus, only reinforces the suspicion that pneumonia and influenza is not the cause.

"The current threat to national security of Ukraine, which we can not offset on our own, requires me to turn to our closest friends and strategic partners for emergency aid", - Yushchenko said in an appeal to the leaders of Belarus, Hungary, Moldova, Poland, Romania, Russia Slovakia, USA, and EU Commission President and Secretary General of NATO.

According to the operative data of the Ministry of Health on 1 November, recorded through out the country more than 191 thousand patients with unknown disease of lungs. Of these, 83 thousand are children. Total number deaths recorded - 60, 123 people are dying.

Day before, on October 31, according to Ukrainian President Viktor Yushchenko, 154 200 people fell ill, according to official data, 48 patients died, including two children.

Authorities officially called the disease "swine flu", "California flu", "SARS","pneumonia", but doctors say on the basis of clinical data and the rapidity of the epidemic, that it is pneumonic plague.

Many Ukrainians believe that Ukraine has been infected with pneumonic plague by Russian terrorist organization, the FSB of Russia, using bacteriological weapons to destabilize the situation necessary for the armed aggression of Russia against Ukraine.

According to unofficial information, the death rate in Ukraine from the alleged pneumonic plague is higher than officially announced.

According to unofficial data, "in Ukraine over the past week about 1500 people have already died. As noted by some doctors, the reason - pneumonic plague. High temperatures from the first day, a burning sensation in the chest, the desire to drink cold and nausea – all of these symptoms are frightening. People die within few days.

On the other hand, Ukrainian media reported that the virus is rapidly spreading in Ukraine and has already reached Odessa:

"1 woman died in the area of Odessa. Swine influenza has not been confirmed, most likely pneumonic plague was the cause.

Odessa and the region is already infected, most likely, is mutated pneumonic plague ", - said one of the doctors of private clinics in Odessa.

"The panic that spreads through the city, is so great that people are willing to sit at home even on just bread and water. Lack of gauze dressings in the city and surrounding areas - is just the beginning, and there is no elementary necessary ascorbic acid and inhalers.

Meanwhile, the first officially recorded death is because of pneumonic plague, and believe me in reality the are much more, "- says the Odessa physician.

All the doctors throughout Ukraine say that this is pneumonic plague.

"I have met with friends from the western Ukraine, the doctors say that the lungs of the dead were black. And that, perhaps this is not influenza but pneumonic plague. Well, if this is indeed a plague, then the news won't mention it for now, and certainly - it's 100% death (according to the U.S. for 1950-1994 - 41%, but the American health care, of course, not Ukrainian, and American doctors knew that they are dealing with a plague - KC).

With each passing day the picture becomes more and more dire, bloggers wrote and continued:

"The number of deaths is understated. The practice of health care service - to respond to anything after a really big problem. And "big" - far not 60 - as reported to the authorities at the moment.

All the actions talk about a really serious problem that the government is facing. The atmosphere in general - I recalled the early days of the Chernobyl accident - were the same "movement", and secrecy on the part of officials.

The regional center: converted the place to fit 200 beds, tripled the personnel of Precinct Therapeutic Services for special situation of contagious diseases (on materials of live broadcast 'Medchinovnika').

By nosocomial information - all the staff of one of the agencies was transferred to the barracks, in which there was a fatal outcome. (No one was allowed to go home at the end of the working day on Friday). Establishment is located not far away from the major microdistricts.

Traffic police from the western regions does not let transport to go to the east. People are running, it's terrible. Official comments: "information about checkpoints we do not confirm, but do not rule out such a course of action."

One of my friends in these minutes is going to Kiev by train. In our area - quarantine, in Kiev - not yet. The stewards not only wear masks but also disposable gloves - at all times. The clinical picture of what the virus is called Ukraine A H1N1 is same as the picture of pneumonic plague - the speed of hemorrhagic damage of lung tissue, on the absence of prodromal period, on hectic - up to 39-40 degrees - temperature.

- Information from Kiev says that it is not an epidemic of swine flu, but a previously unknown form of pneumonic plague. Doctors have been given the orders not to disclose this information. The figures are understated by tens of times, citizens inform.

Note that this summer in one of Chinese cities pneumonic plague was officially declared, and only 3 deaths reported. The city was quarantined. No further deaths were reported.

- All this is not known not only for the reason that the government forces not to disclose the information, carefully concealing the real situation and closes the zone where the epidemic erupted. The exact number of victims is much higher than shown by the statistics - everyone understands it. How many really died? If you take 152 thousand registered patients and only 52 deaths, even from ordinary flu more than 450 people would have died, according to the annual mortality statistics.

At the moment, in the disaster zone (Ternopil, Ivano-Frankivsk, Lviv, Lutsk) receipts are taken of non-disclosure, doctors are not allowed to record the death with symptoms of pneumonic plague. Deaths are recorded as a result of heart attacks and other things.

The zones of "reanimation" increase. Departure from cordon is blocked. Photo, video filming the scene, contacts with the press - are not permitted under any pretext. Facts are checked, according to ordinary Ukrainians.

From Ternopil message: I am afraid - neighbor from above the floor died. I called my classmate - a doctor - she does not want to speak on this thing, but said that she was also scared. Perhaps we have some sort of mutated virus.

- I'm flying to Odessa this night. In Ukraine there is swine flu or pneumonic plague. They say that already died whether a thousand, or 1500 people, writes Corneliy Glas from Yerevan.

- A call on to mobile. On army channels - "Pneumonic plague. Ternopil region - 26 dead. Barracks rearranged into hospitals", said Eustas a resident of Ukraine.

The Ukrainian Flu is Being Taken Seriously in Eastern Slovakia

TASR, 1 November 2009, 17:40
http://www.abovetopsecret.com/forum/thread515093/pg90

Michalovce/Trebisov - V okresoch Michalovce, Sobrance a Trebisov vyskyt chripkovych a tomu podobnych ochoreni zodpoveda tomuto rocnemu obdobiu a nema epidemicky charakter.

V nedelu to uviedli epidemiologicka Janka Staskova z RUVZ* Michalovce a epidemiolog Jozef Sladek z RUVZ Trebisov.

Zatial nezaviedli nijake protiepidemiologicke opatrenia."Chorobnost na chripku a jej podobne ochorenia sa pohybuje na urovni 1500 na stotisic obyvatelov, co zodpoveda zaciatku beznej, sezonnej chripky. Zatial sa nevyskytli nijake vaznejsie komplikacie, ani sme nezistili nijaky novy virus. Situaciu pravidelne monitorujeme," povedal Sladek.

"Som v permanentnom kontakte s lekarmi detskymi i vseobecnymi, ako aj pohotovostami, no vyskyt chripky a jej podobnych ochoreni v nasom obvode je primerany tomuto rocnemu obdobiu," povedala Staskova. "Apelujem vsak na uvedomelost nasich ludi a odporucam, aby necestovali na Ukrajinu a dali sa zaockovat proti sezonnej chripke," doplnila epidemiologicka.

“Uviedla tiez, ze situaciu permanentne monitoruju a v pondelok zvola obvodnu proti epidemiologicku komisiu.

The Ukranian Flu is Being Taken Seriously in Eastern Slovakia. – TASR, 1 November 2009, 17:40

Michalovce/Trebisov - The incidence of flu and flu-like illnesses in the Michalovce, Sobrance and Trebisov regions equate to those of a seasonal character and are not of an epidemic character.

This was reported on Sunday by epidemiologist Janka Staskova of the Publich Health Office RUVZ in Michalovce and epidemiologist Jozef Sladek from the Trebisov RUVZ.

At present they have not adopted any proti-epidemiological measures. “The infection rate from flu and flu-like illnesses are round about 1500 per one hundred thousand residents, which equates to the start of the usual, seasonal flu. Up to now there are no reports of more serious complications, and we also haven’t detected any new virus. We are monitoring the situation regularly,” Sladek said.

She also stated that the situation is being constantly monitored and that a meeting of the regional epidemiological commission has been called for Monday.

“I am in constant contact with pediatricians as well as general physicians, along with emergency [i.e. emergency physicians]; the incidence of flu and similar ailments is average for this time of year in our area,” said Staskova. “However I appeal to all people to be vigilant [literally “to have [it]on their minds/awareness”] and I recommend that they do not travel to Ukraine, and also ["also" is implied] get themselves vaccinated against seasonal flu,” the epidemiologist concluded.

She also stated that the situation is being constantly monitored and that a meeting of the regional epidemiological commission has been called for Monday.

THE FLU CASE

No evidence of a pandemic or new virus in Slovakia bordering Ukraine, says epidemiologist

5 November 2009 12:18

https://web.archive.org/web/20100102052945/http://theflucase.com/index.php?option=com_content&view=article&id=1619%3Ano-evidence-of-a-pandemic-or-new-virus-in-slovakia-bordering-ukraine-says-epidemiologist&catid=1%3Alatest-news&Itemid=64&lang=en

Epidemiologists in Eastern Slovakia, a region bordering Western Ukraine, the scene of an alleged swine flu pandemic emergency, are reporting no evidence of a pandemic or a new virus.

“The infection rate from flu and flu-like illnesses are round about 1500 per one hundred thousand residents, which equates to the start of the usual, seasonal flu. Up to now there are no reports of more serious complications, and we also haven’t detected any new virus. We are monitoring the situation regularly,” Slovakian epidemiologist Janka Sladek told TASR.

World Health Organization

Pandemic (H1N1) 2009, Ukraine

Geneva, WHO, 1 November 2009

https://web.archive.org/web/20100222195454/http://www.who.int/csr/don/2009_11_01/en/index.html

On 28 October 2009, the Ministry of Health of Ukraine informed WHO, through its Country Office in Ukraine, about an unusually high level of activity of acute respiratory illness in the western part of the country, associated with an increased number of hospital admissions and fatalities.

On 30 October 2009, the Ministry of Health of Ukraine announced the confirmation of pandemic (H1N1) 2009 virus infection by RT-PCR in eleven out of 30 samples obtained from patients presenting with acute respiratory illness in two of the most affected regions. Tests were performed in two laboratories in Kyiv, including the National Influenza Centre. Confirmatory tests will be performed at one of the WHO Collaborating Centres for Influenza.

The situation is quickly changing with increasingly high levels of acute respiratory illness (ARI) /Influenza-like-illness (ILI) activity being observed in Ternopil, Lviv, Ivano-Frankivsk, and Chernivtsi regions. The higher levels of transmission in these regions corresponds to an increased number of hospital admissions and fatalities associated with severe manifestations of acute respiratory illness.

As of 30 October 2009, over 2,300 individuals have been admitted to hospital, including over 1,100 children. One hundred and thirty one (131) cases have required intensive care, including 32 children. As of 31 October 2009, a total of 38 fatalities associated with severe manifestations of ARI have been registered. Preliminary epidemiological data analysis indicates that severe cases and deaths primarily occur among previously healthy young adults aged 20 – 50 years. Fatal and severe cases are reported to have sought medical attention 5 to 7 days after onset of symptoms.

International experience of the (H1N1) 2009 pandemic to date, especially from the Southern Hemisphere, has shown that poor clinical outcomes are associated with delays in seeking health care and limited access to supportive care. In addition, this virus has also shown its ability to cause rapidly progressive overwhelming lung disease which is very difficult to treat.

Public health measures recommended by the Ministry of Health of Ukraine across the entire country include: social distancing (school closures and cancellation of mass gatherings); enhancement of surveillance activities; increased respiratory hygiene; and continuation of the vaccination campaign against seasonal influenza targeting at risk groups.

The Government of the Ukraine has activated coordination mechanisms to respond to the rapidly evolving situation, including the harmonization of response plans across all administrative levels.

In response to the request from the Minister of Health of Ukraine, WHO is deploying a multi-disciplinary team of experts to assist national authorities in mitigating the impact of the pandemic. The team comprises of the following expertise: health emergencies coordination, case management, epidemiology, laboratory diagnostics, logistics, and media/risk communications.

As per WHO's communication in May 2009, there is no rationale for travel restrictions because such measures will not prevent the spread of the disease.

Travellers can protect themselves and others by following simple recommendations aimed at preventing the spread of infection such as attention to respiratory hygiene. Individuals who are ill should delay travel plans and returning travellers who fall ill should seek appropriate medical care. These recommendations are prudent measures which can limit the spread of many communicable diseases and not only the pandemic (H1N1) 2009 virus.

Украину охватила эпидемия опасной болезни
В Киеве люди штурмом брали аптеки

Независимая Газета, 2 ноября 2009, 00:00
https://www.ng.ru/cis/2009-11-02/1_epidemia.html

Сегодня в Украину приедет делегация Всемирной организации здравоохранения (ВОЗ), которая проведет свои исследования по эпидемии. Официальные лица в Киеве утверждают, что случаи так называемого калифорнийского гриппа – A/H1N1 – единичны и большинство граждан болеют обычной ОРВИ. Однако это не объясняет чрезвычайно высокие показатели смертности. В стране стремительно распространяются слухи о том, что неизвестная болезнь, вспыхнувшая в Западной Украине, – это легочная чума.

В минувшую среду стало известно, что первая неделя эпидемии унесла жизни 7 человек, в четверг было зарегистрировано уже больше 20 жертв болезни, в пятницу – 30, к субботе – около 40. Начавшись в трех западноукраинских областях, болезнь за несколько дней распространилась на шесть соседних областей.

Позавчера был зарегистрирован первый случай смерти в Одесской области. Врачи сообщили о продвижении эпидемии на восток страны. В Украине началась паника. В конце прошлой недели в Киеве люди штурмом брали аптеки. Там, где еще можно было купить какие-либо средства от простуды и гриппа, очереди выходили на улицу. В какие-то аптеки покупателей перестали впускать – ничего не осталось. По наблюдениям корреспондента «НГ», киевляне запасались лекарствами впрок. На выездах из Киева образовались пробки: все пытались вывезти детей. Столичные санитарные службы утверждали, что на прошлой неделе в городе заболели свыше 10 тыс. человек, но ни у кого не был выявлен вирус A/H1N1. Однако эпидемиологический порог может быть пройден на этой неделе, предупреждают медики.

Во Львове, где свирепствует болезнь, в отличие от Киева признаков паники нет, заверили «НГ» западноукраинские журналисты. Они говорят, правда, львовяне стараются лишний раз не выходить на улицу: в городе тихо и пустынно.

Президент и премьер-министр Украины по отдельности побывали в эпицентре эпидемии. В субботу Юлия Тимошенко в обращении к народу признала, что в стране свыше 150 тыс. больных (на момент подписания номера в печать – уже 200 тыс. - «НГ»), но выявлено менее двух десятков случаев заражения калифорнийским гриппом. Тем не менее правительство объявило на территории Украины третий, наивысший уровень угрозы эпидемии. Во всех учебных и дошкольных заведениях введен трехнедельный карантин, действует запрет на массовые мероприятия.

Глава правительства призвала граждан сохранять спокойствие и сообщила, что с понедельника контрольные службы начнут проверку всех аптек. «Мы будем контролировать не только наличие пакетов первой необходимости, но и цены, которые должны оставаться на уровне прошлой недели», – сообщила премьер, уточнив, что нарушители распоряжения будут лишены

лицензий. Правительство попросило помощи у международных организаций и выделило деньги для закупки лекарств, аппаратов искусственного дыхания и других средств, необходимых в сложившейся ситуации. С четверга в районы эпидемии направляются закупленные ранее запасы медикаментов из госрезерва.

Впрочем, как выяснилось, в Украине и до эпидемии не было препарата, который считается наиболее эффективным для лечения калифорнийского гриппа. В пятницу таблетки, содержащие озельтамивир, можно было купить в отдельных интернет-аптеках, но цена взлетела примерно с 10 долл. до 100 долл. К вечеру телефоны интернет-продавцов не отвечали. Зато харьковская фармацевтическая компания объявила о готовности начать производство препарата.

Правительство пока не сообщало о намерении закупить именно это средство. Депутат Инна Богословская, намеревающаяся баллотироваться в президенты, заявила в ходе одной из телепрограмм, что власть не пытается завезти в страну этот препарат, поскольку скрывает реальную картину. По ее словам, в Украине началась эпидемия легочной чумы. Об этом Богословской якобы рассказали врачи в нескольких западноукраинских областях, где она побывала. Врачи в Киеве тоже сообщили «НГ», что в медицинских кругах обсуждается этот вопрос. Медики отмечают, что по клиническому течению болезнь, способная за три дня уничтожить легкие человека, не напоминает ОРВИ и, в частности, грипп.

Представители власти опровергают эту информацию. Секретарь Совета нацбезопасности и обороны Раиса Богатырева, врач по образованию, признала, что одной из причин паники стало замалчивание ситуации: «Только 27 октября начали обрабатывать данные, хотя люди умирали ранее, начиная с 12 октября надо было бить тревогу – это все правда». Однако Богатырева утверждает, что легочной чумы в стране нет: «Я абсолютно четко говорю, что идентифицирован именно вирус A/H1N1. Сейчас уже 16 случаев». Юлия Тимошенко добавила, что ситуация осложнилась из-за того, что распространение калифорнийского гриппа совпало с массовым заболеванием обычной ОРВИ.

Побывав в ближайшей детской поликлинике, корреспондент «НГ» выяснила, что анализы на выявление возбудителя болезни массово не делают даже сейчас и врачи устанавливают диагноз по внешним признакам. Поэтому точность официальных данных может подлежать сомнению. Министр здравоохранения Украины Василий Князевич сказал «НГ», что об эпидемии объявили только сейчас, поскольку ранее не было оснований: «Известно, что для официального объявления эпидемии нужно было получить результаты лабораторных исследований. В эпидемиологии действуют свои правила, нравится это кому-либо или нет». Он также официально опроверг слухи: «Хочу категорически заявить, что никакой легочной чумы в Украине нет, никакие самолеты не распыляют над городами дезсредства. Это не более чем буйная фантазия любителей сенсаций. Очень жаль, что подогревают подобные сплетни и отдельные политики».

Полную ясность в ситуацию, видимо, внесет делегация ВОЗ. По итогам визита власти, как ожидается, сформулируют четкие просьбы к тем 12 странам, которые предложили помощь в преодолении эпидемии. Не дожидаясь действий светских властей, все православные храмы Украины вчера совершили специальное богослужение – «Молебное пение во время губительного поветрия и смертоносныя заразы». // Киев

Ukraine calls for help fighting swine flu

AFP, 2 November 2009

https://web.archive.org/web/20091107143220/http://www.google.com/hostednews/afp/article/ALeqM5iuF9V8LrFsZ7Ik6cEdCztNqt7f9w

Kiev – Ukraine made an urgent appeal to world powers for help battling swine flu on Sunday, after 60 people died from respiratory problems in a week.

President Viktor Yushchenko wrote to the United States, the European Union, NATO and Ukraine's neighbours to ask for drugs and equipment to fight the spread of the A(H1N1) virus, according to a statement released by his office.

"The threat weighing on Ukraine's national security which we cannot fight alone forces me to ask our close friends and strategic partners for urgent help," Yushchenko wrote.

Ukraine has also ordered 16 tonnes of antiviral drug Tamiflu from Switzerland, the president's office said.

The health ministry said 60 people had died from respiratory problems in the past week, without indicating how many had succumbed to H1N1.

The former Soviet republic has so far reported four fatalities from more than 190,000 cases of swine flu, with nearly 8,000 needing hospital treatment.

Poland and Slovakia responded to Yushchenko's appeal on Sunday night, sending protective masks and supplies of Tamiflu.

Swine flu has become a political issue in Ukraine as the country gears up for January's presidential election.

Both Yushchenko and his rival, Prime Minister Yulia Tymoshenko, have tried to take the lead in managing the crisis prompted by the epidemic.

РИА НОВОСТИ

Легочной чумы на Украине нет - главный санитарный врач

РИА Новости, 2 ноября 2009, 12:44
https://ria.ru/20091102/191611725.html

Киев, 2 ноября – РИА Новости.

Главный санитарный врач Украины Александр Беловол опровергает информацию о том, что причиной человеческих смертей на Западной Украине стал не грипп, а легочная чума.

"Ни о какой чуме не может быть и речи. Это грипп, который есть во всем мире", – сказал Беловол украинскому агентству УНИАН в понедельник.

В минувшую пятницу, 30 октября, депутат парламента Инна Богословская, баллотирующаяся в президенты Украины, заявила в вечернем эфире одного из телеканалов, что на самом деле смерть людей на западе страны вызвана легочной чумой.

На сегодня на Украине от гриппа и ОРВИ умерли 60 человек, более 190 тысяч заболели. В основном грипп и ОРВИ регистрируются на Западной Украине, однако есть опасения, что эпидемия распространится и в другие регионы.

SPIEGEL Wissenschaft

Benjamin Bidder

Wahlkampf mit Atemschutzmasken und Tamiflu

Spiegel, 2 November 2009, 16.22 Uhr
https://www.spiegel.de/wissenschaft/mensch/schweinegrippe-in-der-ukraine-wahlkampf-mit-atemschutzmasken-und-tamiflu-a-658774.html

200.000 Kranke, 67 Tote und dramatische Hilferufe an das Ausland: Die Schweinegrippe breitet sich rasend schnell in der Ukraine aus. Präsident Juschtschenko und Premierministerin Timoschenko wurden von der Epidemie überrascht – jetzt wollen sie sich im Wahlkampf als Krisenmanager profilieren.

Wenn Lembergs Bürgermeister Andri Sadowyj Gäste in seinem Kabinett empfangen will, streift er jetzt immer eine weiße Atemschutzmaske über, sicher ist sicher. "Über die Stadt wurde Quarantäne verhängt, das ist das effektivste Mittel, damit sich die Leute nicht mit der Schweinegrippe anstecken", sagt Sadowyj.

Schulen und Kindergärten sind geschlossen. Flugblätter informieren die Bevölkerung, wie sie sich während der Pandemie zu verhalten hat. In Bussen, Bahnen und Taxis werden die Bürger dazu angehalten, Mundschutz zu tragen. "Wir haben jetzt viermal so viele Notrufe wie sonst", sagt Bürgermeister Sadowyi. "Normal sind 300, jetzt sind es 1200 am Tag. Und auch die Ärzte fallen aus, jeder zehnte Mediziner ist krank."

Landesweit haben sich 200.000 Menschen infiziert, melden staatliche Stellen. Mehr als 60 sollen bereits gestorben sein. Am schwersten getroffen: die Region Lemberg ganz im Westen der Ukraine, der von Grippewelle regelrecht überrollt wird. 70.000 Menschen sind hier erkrankt, tausend werden in Krankenhäusern behandelt.

Die von der Wucht der Epidemie überraschte Führung reagiert hektisch: Neun Provinzen wurden unter Quarantäne gestellt, doch die Maßnahme könne "jederzeit auch auf andere Landesteile ausgeweitet werden", mahnt Gesundheitsminister Wassili Knjasewitsch.

n einem dramatischen Appell hat Präsident Wiktor Juschtschenko am Wochenende das Ausland um Beistand gebeten. Die Ukraine könne nicht aus eigener Kraft der Gefahr entgegentreten, die das Virus für die "nationale Sicherheit" darstelle. Polen und die Slowakei haben schon reagiert und 200.000 Atemschutzmasken zugesagt.

Wer dennoch keine Maske mehr ergattern könne, dem empfahl Premierministerin Julia Timoschenko, sich selbst einen Mundschutz zu basteln. Ein Rat, den offenbar viele Ukraine befolgen: So berichtet die Zeitung "Kommersant" von ungewöhnlich leeren Straßen auch in der Hauptstadt Kiew, von Bürgern, die mit Tüchern oder Mullbinden Mund und Nase verhüllen. Schon gibt es auch Überlegungen, das für Mittwoch angesetzte Champions-League-Spiel zwischen dem heimischen Club Dynamo und Inter Mailand vor leeren Rängen auszutragen - damit sich die Zuschauer im Gedränge nicht gegenseitig anstecken.

WHO ist ratlos

"Im Moment kommen zwei Grippewellen zusammen: zum einen die normale, saisonale Grippe, zum anderen die Schweinegrippe", sagt Tatjana Bachtejewa, Vorsitzende des Gesundheitsausschusses des Parlaments in Kiew, zu SPIEGEL ONLINE. "Hunderttausende sind schon erkrankt, 7000 werden in Krankenhäusern behandelt, die Hälfte davon sind Kinder. 67 Menschen sind bereits gestorben, allein sieben am heutigen."

Wie viele der Todesfälle und Infektionen allerdings tatsächlich auf den neuen Erreger H1N1 entfallen, ist schwer nachzuvollziehen. Auch bei der Weltgesundheitsorganisation WHO ist man ratlos. "Wir müssen uns erst ein Bild von der Lage machen", sagte eine Sprecherin zu SPIEGEL ONLINE. Am späten Montagabend wird eine WHO-Delegation in Kiew erwartet und umgehend in die betroffenen Gebiete reisen.

"Der Westen ist deshalb so stark betroffen, weil es dort schon Ende September den ersten Frost gegeben hat", erklärt Bachtejewa, die selbst der vor allem in der Ostukraine verwurzelten "Partei der Regionen" angehört. "Der Kälteeinbruch hat die Menschen unvorbereitet getroffen, viele Zentralheizungen waren damals noch nicht in Betrieb, und selbst heute sind noch viele Wohnungen kalt."

Außerdem verdingten sich viele Westukrainer den Sommer über als Gastarbeiter in Polen und Rumänien, bei ihrer Rückkehr hätten sie den Erreger wohl eingeschleppt, mutmaßt Bachtejewa - und beschwört die nationale Einheit. Jetzt, so die beschwörenden Worte der Abgeordneten, müssten alle politischen Kräfte zusammenstehen. Gleichwohl keilt Bachtejewa wenig später unverdrossen gegen Präsident und Premier in Kiew, die das Land trotz rechtzeitiger Warnungen im Sommer nicht auf die Krise vorbereitet hätten: "Die Regierung ist schuld. Jetzt sind die Apotheken leer."

"Die Regierung ist schuld"

Gut zwei Monate vor den anstehenden Präsidentschaftswahlen ist es mit der nationalen Geschlossenheit in der Ukraine nicht weit her. Zwar wurden wegen der Ansteckungsgefahr auch viele Auftritte der Kandidaten abgesagt. Doch die setzen den Wahlkampf, der bislang eher einer Schlammschlacht denn einer politischen Auseinandersetzung glich, ungeachtet der dramatischen Lage im Land fort.

Timoschenko habe noch Ende Oktober ihre Anhänger verantwortungslos zu Parteikundgebungen gerufen, obwohl sie bereits von der Ansteckungsgefahr gewusst habe, poltert der Wiktor Janukowitsch, aussichtsreicher Kandidat der "Partei der Regionen". Präsident Juschtschenko und die Premierministerin, die selbst nach dem höchsten Staatsamt strebt, suchen sich derweil selbst als tüchtige Krisenmanager zu profilieren.

Timoschenko eilte in der Nacht auf Montag zum Kiewer Flughafen Borispol, um eine Antonow-Frachtmaschine persönlich in Empfang zu nehmen, die tonnenweise das Grippe-Medikament Tamiflu aus der Schweiz lieferte. Prompt zog Staatschef Juschtschenko nach - und ließ auf seiner Web-Seite verbreiten, er "gratuliere heute der Ukraine dazu, dass es uns in einer sehr knappen Zeit gelungen sei, die Fracht zu liefern, die wir sehr dringend benötigen".

Manche Beobachter glauben hingegen, den wahlkämpfenden Lagern komme die Aufregung um die massenhafte auftretende Erkrankung durchaus gelegen. Vermutlich sei die derzeitige Krankheitswelle kaum schlimmer als die normale saisonale Grippe, zitiert die russische Zeitung "Trud" Konstantin Bondarenko, Politologe und Leiter des Kiewer "Instituts für Verwaltungsprobleme". Es gebe allerdings viele politische Kräfte, so Bondarenko, die danach strebten, sich als Retter der Nation zu profilieren.

"Свиной грипп" в Украине: Ложь врачей, пиар и отмывание 5,5 миллиардов

Украинская Правда-23, 2 ноября 2009, 22:07
https://www.pravda.com.ua/rus/articles/2009/11/2/4511357/

В стране нет эпидемии "свиного гриппа", но есть банальная эпидемия гриппа – как и каждый год. Но в результате извращения фактов в Украине объявлена эпидемия совершенно другой болезни. Всего за один день под этим предлогом правительство решило потратить несколько миллиардов гривен.

Дальше можно уже ничего не объяснять. Но детали не хуже, чем суть происходящего.
Давайте ответим на несколько вопросов:
- Существует ли в Украине эпидемия "свиного гриппа"?
- Существует ли в Украине эпидемия вообще?
- Почему уже два года нас пугают сперва атипичной пневмонией, а затем "свиным гриппом"?
- Кто зарабатывает на эпидемии?

Князевич, Тимошенко и Ющенко придумали эпидемию "свиного гриппа"

Для ответа на эти вопросы нужно проследить, как развивались события. До прошлой пятницы страна жила без эпидемии.

30 октября, в информационных агентствах появились первые сообщения о том, что от гриппа и ОРВИ в западных областях Украины за последние 11 дней умерли 30 или 34 человека (по разным версиям).

Всего заболевших к 30 октября было 40 тысяч человек. Допустим, это много.

Хотя, может быть, и нет. На дворе ноябрь, сырость, холод. И почему-то не приводится статистика прошлых лет. Нет данных для сравнения. А значит, можно говорить все, что угодно.

Так и получилось. В тот же день заговорили об эпидемии свиного гриппа и атипичной пневмонии в Украине.

Со слов министра здравоохранения Василия Князевича: "К сожалению, мы должны констатировать, что в Украине фактически началась эпидемия калифорнийского гриппа A/H1N1. Мы рассматриваем возможность объявления карантина не только в западных областях, но и по всей стране, так как вирус распространяется чрезвычайно быстро", - сказал он. Тут же новость подхватили и развили Виктор Ющенко, Юлия Тимошенко и СНБО.

А теперь внимание. Знаете ли вы, что такое эпидемия? Классика жанра говорит, что это болезнь, которая распространяется со скоростью большей, чем до этого.

Теория эпидемий рассказывает, что поначалу в неделю заболевают несколько людей. Если их не лечить, то со временем накапливается критическое количество больных. А после того, как, условно, заболевают 649 человек, процесс заражения новых людей ускоряется в десятки и сотни раз. Эта грань называется "эпидемический порог". После того, как она превышена, начинается эпидемия.

Интересно, на основе каких данных Князевич объявил эпидемию "свиного гриппа"? Он не привел никакой статистики, кроме общего количества заболевших от ОРВИ и гриппа.

Ведь на то время было известно еще и такое: "В Украине официально подтверждены два случая свиного гриппа. 5 июня 2009 года лаборатория в Лондоне подтвердила заболевание гриппом A/H1N1 у украинца, прибывшего из Парижа. После лечения пациент отправился домой, в Черновцы. Кроме того, в конце сентября у мужчины, который прибыл из Кировоградской области в Киев и был госпитализирован с диагнозом "пневмония", подтверждена принадлежность выделенного штамма вируса гриппа к типу A/H1N1".

Откуда взялся "свиной"?

Итого, 40 тысяч простуженных, 30 умерших от общих простудных и вирусных заболеваний плюс ДВА!!! подтвержденных случая A/H1N1. Разве эпидемия начинается после двух подтвержденных больных?

30 октября оказалось, что больных A/H1N1 не два, а целых три. Минздрав потвердил, что лишь один случай смерти из 30 имеет диагноз "свиной грипп".

Отдельный вопрос, как они определены. В понедельник председатель парламентского Комитета по вопросам здравоохранения Татьяна Бахтеева рассказала, что в Украину в рамках гуманитарной помощи от США поступили 200 тестовых комплектов. Но к ним не хватает особых деталей ("праймеров"), которые нужны непосредственно для идентификации "свиного гриппа". Получается, его определили на обычном микроскопе?

30 октября Тимошенко заявила, что в Украине лабораторно подтверждены 11 случаев заболевания гриппом A/H1N1.

Снова повторим вопрос - 11 человек это эпидемический порог для страны с населением 46 миллионов человек?

Позже в понедельник стало известно о 22 больных. Всего за два дня. 2 ноября появилась такая новость: "К настоящему времени в Украине зафиксировано 67 смертельных исходов от заболеваний гриппом и ОРВИ, сообщил первый заместитель министра здравоохранения Василий Лазоришинец на брифинге в понедельник. Всего зарегистрировано 255 тысяч заболевших ОРВИ и гриппом, 15 тысяч из которых находятся в стационаре, в том числе 170 человек - в отделении интенсивной терапии. При этом официально подтверждены 22 случая заболевания гриппом A/H1N1".

А два часа спустя в то же день Тимошенко назвала другую цифру – 14 заболевших, при этом она подчеркнула, что число зараженных "свиным гриппом" по состоянию на понедельник не изменилось.

И 2, и 3, и 11, и 14, и 22 – все эти числа говорят лишь о том, что министр и его первый заместитель придумали эпидемию "свиного гриппа". Высосали ее из стерильного медицинского пальца. А премьер-министр и президент поддержали их в этом занятии.

Наконец, пик маразма. Уже 30 октября Тимошенко заговорила о возможности массовой вакцинации. "Решение о массовой вакцинации не принято, поскольку ученые еще советуются и окончательно не определились в ее целесообразности", - сказала она.

Да, возможно, есть эпидемия. Но не "свиного гриппа", а обычного. Или ОРВИ. Что, опять же, вполне нормально для осени.

Сегодня Минздрав дает статистику, которую невозможно сравнить с предыдущими годами, чтобы понять, насколько увеличилось количество заболевших, каков на самом деле уровень смертности. При этом, говоря о пневмонии, даже сама Тимошенко признает, что "динамика по сравнению с предыдущим годом приблизительно такая же. Но количество смертных случаев на 20% ниже".

И еще. Есть общеизвестная статистика. Каждый год от разных мутаций гриппа умирают полмиллиона человек. Это примерно 1 400 тысяч человек в день.

Та же ситуация по пневмонии. От простого воспаления легких во всем мире каждый год умирают только 2 миллиона детей. Наверное, еще столько же взрослых, потому что простуживаются все и в любом возрасте.

С этой точки зрения, 30 умерших в Украине, при том, что каждая из этих смертей – горе для близких, небольшая цифра.

Ведь согласно данным региональных бюро Всемирной организации здравоохранения, общее количество лабораторно подтвержденных случаев заболевания людей, вызванных вирусом A/H1N1, в мире составляет 407 тысяч 677, в том числе 4 тысяч 877 - летальных случаев.

Разве это дает нам повод говорить о смертельной угрозе, нависшей над Украиной?

В конце 90-х по южной Украине прокатилась эпидемия холеры. 2 года подряд врачи находили трупы бомжей, объявляли о найденной у них холере и выбивали под борьбу с болезнью. Финансирование. Каждый раз, примерно через месяц, врачи объявляли о победе над эпидемией, и любая информация о холере исчезала. Сами медработники поговаривали, что таким образом чиновники облздравов зарабатывали деньги в условиях, когда медицина хронически недофинансировалась.

Сейчас эта схема может быть использована в масштабах всей страны.

Все из-за денег, или как потратить 5,5 миллиардов

Внимание! В стране нет эпидемии "свиного гриппа". Скорее всего, есть банальная эпидемия гриппа – как и каждый год. Но в результате извращения фактов в Украине объявлена эпидемия совершенно другой болезни. И под этим предлогом правительство решило потратить 5,5 миллиарда гривен.

Дальше можно уже ничего не объяснять. Но детали не хуже, чем суть происходящего.

Очень удивительный факт – скорость, с которой правительство и президент отреагировали на якобы возникшую эпидемию. Об "эпидемии" стало известно 30 октября. И в тот же день были приняты все ключевые решения. Как только стало известно о болезнях, и.о. министра финансов Игорь Уманский и премьер Юлия Тимошенко сказали, что готовы дать деньги на борьбу с болезнью. Нужно лишь знать, сколько.

И о чудо! Уже в тот же день они знали, сколько нужно!

Это само по себе удивительно. При нашей бюрократии и бесхозяйственности, сбор информации от больниц и аптек занял бы минимум неделю. За один день она могла поступить только в двух случаях: либо она была заготовлена заранее, либо ее не было вообще.

"Правительство выделяет 0,5 миллиардов гривен для того, чтобы закупить все необходимые лекарственные средства", - сказала Тимошенко, открывая утреннее заседание правительства в пятницу.

Немного позже в тот же день, на встрече с руководителями западных областей, она назвала уже в шесть раз большую цифру - 3 миллиарда. "Это в два раза больше, чем необходимый объем лекарств. На эти 3 миллиарда гривен будут куплены лекарства, маски, медицинское оборудование, в областях будут созданы специальные лаборатории, будут созданы специальные правительственные группы, которые будут работать в областях", - сказала премьер.

Правда, через какое-то время 3 миллиарда исправили на 500 миллионов. Звучала ли цифра 3 миллиарда, уже никто не может точно сказать. Предлагаем считать, что да. Поскольку в тот же день ее растиражировали многие телеканалы и печатные СМИ.

В обоих случаях Тимошенко не уточнила, из каких источников правительство планирует выделить данные средства. Напомним, сейчас у Кабмина вообще нет денег, и он берет в долг под 30% годовых.

Теоретически, это значит, что деньги должен будет напечатать Нацбанк. И, конечно же, он не имеет права отказать. Тут же дело серьезное.

В понедельник вопрос денег получил интересное продолжение. Виктор Ющенко предложил дофинансировать повышение соцстандартов за счет таинственного источника - "экономии на обслуживании внутреннего долга".

В тот же день Тимошенко подала в Раду поправки к бюджету-2009. В них она предложила профинансировать выделение денег на борьбу со "свиным гриппом" за счет того же источника – "экономии на обслуживании внутреннего долга".

Так вот, речь идет о 5,5 миллиардах гривен. Правительство планировало в этом году потратить на обслуживание госдолга 10 миллиардов гривен. Но по факту потратит лишь 4,5 миллиарда. Дал денег МВФ, плюс на рекапитализацию потрачено гораздо меньше, чем ожидалось.

Конечно, этих денег нет "в натуре". В любом случае, их должен будет "напечатать" Нацбанк. Поэтому должны быть очень веские причины, чтобы Стельмах не мог отказать Тимошенко.

И оказалось, что для этого есть все предпосылки. Только кажется, что до 30 октября Украина жила без "свиного гриппа".

Уже два года в стране и мире постоянно ведется информационная кампания, которая должна была приучить население к двум мыслям. Первая - что эта болезнь существует. Вторая – что она очень опасна.

Кампания работала по принципу закона эпидемии. Поток информации накапливался, но несколько новостей в день на одну и ту же тему нельзя было проанализировать. Поэтому новости работали на создание некого информационного фона и тревоги.

30 октября наступил ключевой момент. В тот день начали говорить все – Минздрав, Тимошенко, Ющенко, Богатырева. Все бросились пиариться на громком информповоде. И тут же у людей сработала глубинная память. Все, чем их пичкали два года, вылилось в психоз. Тут же возникли маски, очереди в аптеках и разговоры о необходимости потратить 500 миллионов, 3 миллиарда и 5,5 миллиардов.

Проанализировав новости в интернете, можно было ожидать, что лекарства будут покупаться у британской GlaxoSmithKline PLC. Но в реальности, оказалось, что выиграет другая фармацевтическая компания.

30 октября секретарь СНБО Раиса Богатырева заявила, что Украина обратится за гуманитарной помощью к странам, у которых есть препараты, чувствительные к вирусу A/H1N1.

Среди всего прочего, в состав гуманитарной помощи должен входить "Тамифлю" - этот препарат рекомендует ВОЗ для борьбы со "свиным гриппом". По словам заместителя министра охраны здоровья, по рекомендации ВОЗ, "если в регионе зарегистрирован хотя бы один случай заболевания гриппом A/H1N1, то лечение становится единым для всех заболевших ОРЗ".

"Тамифлю" - препарат швейцарской компании F. Hoffmann-La Roche LTD. И именно этой компании в ближайшее время потекут сотни миллионов из Украины.

"Тамифлю", а не другие лекарства от обычного гриппа, уже дают всем беременным женщинам, которые живут на западе Украины и имеют глупость обратиться за помощью к врачам после мелкого чиха.

Не хочется комментировать обоснованность решений ВОЗ. Но почему в Украине, где нет эпидемии "свиного гриппа", беременных пичкают именно этим препаратом?

Подведем итоги

Вывод первый. Эпидемия "свиного гриппа" придумана.

Вывод второй. Тем не менее, под нее правительство хочет потратить 5,5 миллиардов.

Вывод третий. Поэтому премьер, президент, глава СНБО и, естественно, Минздрав всячески стимулируют тему эпидемии. Их поддерживают масса разных людей – от международных чиновников и бизнесменов до простых людей, поддавшихся психозу.

Вывод главный. Все это не значит, что болезни нет. Есть, но она другая – обычный грипп. Поэтому защищайтесь от инфекции. Но, покупая маску или "Тамифлю", помните, что в этот момент кто-то зарабатывает на вас миллиарды.

Made for minds.

Schweinegrippe auf dem Vormarsch

DW, 2 Novembre 2009
https://www.dw.com/de/schweinegrippe-auf-dem-vormarsch/a-4850220

Derzeit sind bundesweit mehr als 7000 Personen an der "Schweinegrippe" erkrankt. Bislang sind in Deutschland sechs Menschen an dieser neuen Form der Influenza verstorben. Experten rechnen mit steigenden Zahlen.

…

Ukraine mit Schweinegrippe-Epedemie

Dramatisch ist die Lage in der Ukraine. Dort wurden vorsorglich Schulen und Kindergärten geschlossen und Massenveranstaltungen verboten. Zudem wurde über neun Regionen des Landes eine Quarantäne verhängt. Diese Maßnahmen sind Reaktionen auf drastisch gestiegene Infektions- und Todeszahlen: Die Ukraine meldet 255000 Erkrankungen und 70 Tote. Schwerpunkt der epedemischen Ausbreitung ist vor allem der Westen des Landes um die Stadt Lwiw, dem früheren Lemberg.

Staatschef Viktor Juschtschenko warnte sogar vor Gefahren für die nationale Sicherheit und bat deshalb die benachbarten Länder, die EU und die NATO um Hilfe. Was allerdings das Militärbündnis bei der Bekäampfung der Schweinegrippe leisten könnte, blieb unklar. Offensichtlich denkt der Präsident an Unterstützung bei der Versprühung von Chlor und anderen Chemikalien aus der Luft, um das Virus abzutöten.

Beim Handel mit dem Grippemittel "Tamiflu" ist es in der Ukraine offenbar in einigen Fällen zu Wucherpreisen von einigen Hundert Euro je Tamiflu-Packung gekommen, obwohl der Schweizer Pharmakonzern Roche dem Land das Medikament zu einem Sonderpreis zur Verfügung gestellt hatte. Die Regierung kündigte an, diesen Preis-Wucher auf Kosten der Bevölkerung hart zu bestrafen. Gleichzeitig deckten sich viele Menschen mit traditionellen ukrainischen "Medikamenten" ein: Wodka, Zitronen und Knoblauch.

THE FLU CASE

Ukraine: Influenza or Pneumonic Plague?
The situation is getting worse and worse

The Flu Case, 2 November 2009, 21:37

https://web.archive.org/web/20091106015455/http://www.theflucase.com/index.php?option=com_content&view=article&id=1576:ukraine-unknown-virus-is-killing-people&catid=41:highlighted-news&Itemid=105&lang=en

Ukrainian News Agency "Fraza" reported that, according to informed sources, "it has been confirmed 100 % Pneumonic Plague in Ukraine".

The Agency asserts that "the head physician of the medical institutions has sent out an informal disposal - not to sow panic, to refute the information about the plague, and to speak only of swine influenza".

It is also required to distribute masks at health facilities with 8 levels of protection and anti-plague protection costumes. There is also an informal order not to allow any visitors to see the patients.

According to the "Fraza" agency, "today in Ukraine pneumonic plague is going in parallel with swine flu. The plague has killed over 60 people, and about 14 from the flu.

Meanwhile, the press service of the Ministry of Health of Ukraine reported that there is only one death from "California" virus A/N1N1 in Ukraine.

"In Ukraine there are 22 cases recorded of the virus A/N1N1 disease and there is only one fatal consequence as a result. All other cases of death from influenza has only a speculative attitude to "California" virus," press service reports.

The situation with the epidemic of influenza is a complex and unpredictable because of the propensity of influenza A/H1N1 virus to mutation, said First Deputy Minister of Health Mr. Lazoryshynets on Monday, November 2.

"The situation is complicated and unpredictable. We found a strain of this virus in our laboratory ... This virus is dangerous because it can mutate, and we can get a very different kind of virus, which was in Latin America or in Mexico, now it is European ", - said Lazoryshynets at a press conference, the "Correspondent" magazine informs.

At a press conference Lazoryshynets also said that there are 22 officially confirmed cases of influenza A/H1N1 in Ukraine.

First Vice Prime Minister Oleksandr Turchinov previously stated that as of Monday morning, November 2, there are 64 registered deaths in Ukraine from flu and acute respiratory viral infections.

Meantime, according to official information the highest level of epidemiological risk is declared in Ivano-Frankivsk (Stanislav) area, from 2 November. This decision was made by Ivano-Frankivsk Regional emergency epidemiological commission at the extended session on November 2.

In accordance with the Commission, quarantine will last for all educational institutions in the area until 20 November, a commission to monitor the distribution of medicines is also made, which come in the region as humanitarian aid.

The commission agreed that health workers will provide individual first aid kit. There will be extra transport allocated to visit patients by the district doctors.

According to the Ministry of Health, today in Ukraine there are 255 000 registered cases of influenza and SARS, of whom 15 000 were hospitalized.

Ministry of Transport and Communications of Ukraine introduced a permanent monitoring of the situation on a clear implementation of the planned anti-epidemic measures in public transport.

A special monitoring group studied the transport department on November 2, how the anti-epidemiological measures were applied at the Kiev railway station, central bus station of the capital and the International airport "Borispol".

Polish epidemiologists November 3 arrive in Ukraine for obtaining specimens from patients with the Ukrainians. The experts will arrive in Lviv, where it is supposed to take 190 samples.

Polish epidemiologists are expected to arrive in Ukraine on November 3 to obtain samples from patients. The experts will arrive in Lviv, where 190 samples are to be taken.

Lithuanian Foreign Ministry on November 2 recommended to the residents of Lithuania to refrain from unnecessary trips to the Ukraine.

Kavkaz Center

УКРАИНСКАЯ ПРАВДА

Эпидемии свиного гриппа нет

Украинская Правда, 2 ноября 2009, 23:51
https://web.archive.org/web/20091105174651/http://www.pravda.com.ua/ru/news/2009/11/2/101204.htm

В Украине нет эпидемии свиного гриппа.

Об этом заявил главный санитарный врач Александр Биловол в эфире телеканала ICTV.

По его словам, "эпидемия гриппа и ОРЗ отмечается в западных регионах". "Особенно в 11 регионах, где практически на 15% превышен порог", - сказал главный санитарный врач.

"В других регионах отмечается предыдущего уровня показатели, которые были в 2007-2008 годах", - заявил Биловол.

Он отметил, что в результате эпидемии, по последним данным, умер 71 человек.

Главный санитарный врач сообщил, что есть 14 лабораторно подтвержденных случаев гриппа A/H1N1.

"У трех человек, которые умерли, выявлен грипп A/H1N1", - добавил Биловол.

Также он заявил, что "100% верификацию этого диагноза в Украине дают две лаборатории, которые оснащены современным оборудованием - это центральная санэпидемстанция и институт Громашевского".

Епідемії свиного грипу в Україні немає

Oglyadach, 3 листопада 2009, 10:45
https://web.archive.org/web/20091108052333/http://oglyadach.com/news/2009/11/3/214961.htm

Влада врешті-решт здогадалася пояснити українцям, що впали в паніку, що в Україні немає епідемії свиного грипу.

Про це заявив головний санітарний лікар Олександр Біловол в ефірі телеканалу ICTV.

За його словами, "епідемія грипу відмічається в західних регіонах".

"Особливо в 11 регіонах, де практично на 15% перевищений поріг", - сказав головний санітарний лікар.

"У інших регіонах відмічаються попереднього рівня показники, які були в 2007-2008 роках", - заявив Біловол.

Він відзначив, що в результаті епідемії, за останніми даними, померла 71 людина.

Головний санітарний лікар повідомив, що є 14 лабораторно підтверджених випадків грипу A/H1N1.

"У трьох людей, які померли, виявлений грип A/H1N1", - додав Біловол.

ЖИТОМИР info

В Украине нет эпидемии свиного гриппа

Житомир info, 3 November 2009, 10:53
https://zhitomir.info/news_48822.html

В Украине нет эпидемии свиного гриппа. Об этом заявил главный санитарный врач Александр Биловол в эфире телеканала ICTV.

По его словам, "эпидемия гриппа и ОРЗ отмечается в западных регионах. Особенно в 11 регионах, где практически на 15% превышен порог, - сказал главный санитарный врач. - В других регионах отмечается предыдущего уровня показатели, которые были в 2007-2008 годах", - заявил Александр Биловол. Он отметил, что в результате эпидемии, по последним данным, умер 71 человек.

Главный санитарный врач сообщил, что есть 14 лабораторно подтвержденных случаев гриппа A/H1N1. "У трех человек, которые умерли, выявлен грипп A/H1N1", - добавил Александр Биловол.

Также он заявил, что "100% верификацию этого диагноза в Украине дают две лаборатории, которые оснащены современным оборудованием - это центральная санэпидемстанция и институт Громашевского", передает Украинская правда.

Премьер-министр Юлия Тимошенко вчера на совещании с украинскими производителями лекарств также заявила: "Сегодня у нас рассказывают, что есть эпидемия свиного гриппа, тогда как выявлено всего 14 случаев заражения этим вирусом. В Украине эпидемия обычного гриппа", пишет газета "Коммерсантъ-Украина".

Как отмечает издание, Всемирная организация здравоохранения официально подтвердила, что по состоянию на 25 октября в мире зарегистрировано более 440 тыс. случаев заражения человека гриппом A/H1N1, известным также как свиной грипп. Количество летальных исходов превысило 5,7 тыс. В частности, в Северной и Южной Америке заболели 174,5 тыс. человек, из них умерли 4,175 тыс. (в США – 1 тыс.); в Африке – 13,5 тыс. человек, умерли 75; в странах Восточного Средиземноморья – 17,15 тыс. человек, умерли 111. В Юго-Восточной Азии количество заразившихся свиным гриппом составило 42,901 тыс. человек, из них скончались 605. В странах Западного Тихоокеанского региона зарегистрировано 129,509 тыс. заболевших вирусом A/H1N1, из них 465 умерли.

В Европе заболели 64 тыс. человек, скончался 281. За последнюю неделю впервые были зарегистрированы факты смерти больных гриппом A/H1N1 в странах, граничащих с Украиной – Российской Федерации и Молдавии. В России общее количество заболевших превысило 2 тыс. человек, зафиксировано 10 смертей. В Молдавии заболели 19 человек, 1 из них умер. В Венгрии подтверждено 283 случая заболевания гриппом A/H1N1, из которых 4 имели летальный исход. В Румынии зафиксировано 447 заболевших, в Словакии – 149, в Польше – 166, в Беларуси – 38. Однако факты смерти от гриппа в этих странах не зарегистрированы.

По оперативным данным Минздрава Украины, по состоянию на 17:00 2 ноября в Украине зафиксированы больше 255 тыс. больных гриппом или ОРВИ. Из них больше 120 тыс. - дети. Госпитализировано больше 15 тыс. человек. 235 человек находится в тяжелом состоянии. В результате эпидемии умерло уже 70 человек.

Если ранее печальное первенство по заболеванию удерживали только четыре области (Львовская, Тернопольская, Ивано-Франковская и Черновицкая), то теперь к ним быстрыми темпами приближаются Волынская, Киевская, Ривненская и Закарпатская области. ...

RADIO NETHERLANDS WORLDWIDE

Ukraine virus mystery deepens

Radio Netherlands Worldwide, 3 November 2009, 1:02 pm
https://web.archive.org/web/20091106072331/http://www.rnw.nl/english/article/ukraine-virus-mystery-deepens

Ukraine is in a state of hysteria as a mystery flu epidemic grips the country in the run-up to presidential elections. Schools have been closed and there is a ban on public gatherings.

The situation is so bad, the mayor of Kiev is even planning to have the Champions League football match between Dynamo Kiev and Italian side Inter-Milan played behind closed doors on Wednesday evening. At the very least - at the least spectators will be asked to wear face masks.

The country ordered 650,000 doses of the anti-viral drug Tamiflu at the weekend and hundreds of thousands more doses are already on their way. Millions of face masks are also being produced.

The mystery of the unidentified flu virus in Ukraine, first reported by RNW on 29 October, has deepened. The websites of various conspiracy theorists are now even discussing the possibility that biological warfare experiments are the cause.

Rumours no surprise

Given that the Ukraine is still dealing with the consequences of the Chernobyl nuclear disaster ofin 1986, it's unsurprising that such rumours have arisen. But are they just rumours, or is there some substance to the claims?

In August 2009, a man called Joseph Mosse, who claims to be a former microbiologist with the Israeli intelligence agency Mossad, was arrested in Los Angeles, after having made threats against the White House. Shortly after his arrest there were reports that he had called into a radio show with a warning about a biological weapon being prepared in the Ukraine by a company called Baxter International. According to these reports, Mr Mosse said that the weapon would be spread via a flu vaccine.

Facts vs theories

Credence is being given to these reports because Mr Mosse's qualifications as a microbiologist are confirmed by his research profile on this website. There is also a story doing the rounds that a light aircraft has been spotted spraying an unidentified substance over the capital, Kiev, but this has been denied by the country's Office of Emergency Reponse.

However, this is only one of the current theories. Some political analysts believe that talk of a pandemic is hype generated by opposition politicians in the run-up to elections in January, and the Ukrainian government is playing down the claims. The government's stance is supported by the World Health Organisation, which has sent a team to the Ukraine, and reports no evidence of a severe outbreak of flu, beyond the normal level for this time of the year.

Waiting for the outcome

The Ukrainian Health Minister Vasyl Kniazevych told the national radio station that he believes the as-yet unidentified virus could be one that has already been discovered and is known as California A/H1N1 flu. This is thought to be a more virulent strain of the H1N1 virus. The minister says that efforts to identify the mystery virus are expected to take several weeks. The various competing theories will no doubt continue to circulate as Ukraine and the rest of the world await the findings.

Nachrichten.ch

WHO-Expertenteam in die Ukraine gereist

Nachrichten, 3 November 2009, 19:03 h
https://www.nachrichten.ch/detail/412670.htm

Genf/Kiew:
In der Ukraine hat die Zahl der Schweinegrippe-Infektionen epidemische Ausmasse erreicht. Im Westen des Landes kam das öffentliche Leben zum Erliegen.
fest / Quelle: sda / Dienstag,

Schulen und Kindergärten blieben geschlossen, Massenveranstaltungen wurden abgesagt. Bisher sind laut dem ukrainischen Gesundheitsministerium 255'000 Menschen infiziert. Gemäss WHO befinden sich 235 Patienten auf Intensivstationen. Nach letzten Angaben starben in der Ukraine 71 Personen an der Grippe.

Medikamenten-Engpässe
Überall werden Engpässe mit Medikamenten beklagt. Aus Westeuropa treffen immer wieder Lieferungen der dringend benötigten Schutzmasken ein. Die Weltgesundheitsorganisation (WHO) entsandte ein achtköpfiges Expertenteam, welches auch Proben zur Untersuchung nach London schicken wollte. Die WHO erhofft sich, anhand der Epidemie in der Ukraine aufzuzeigen, wie sich der Grippevirus in der nördlichen Hemisphäre in der Winterzeit verhält, insbesondere in Osteuropa.

Grenzübergänge geschlossen
Die Slowakei schloss zwei Grenzübergänge zur Ukraine
An den anderen drei Grenzübergängen wurden die Reisenden stichprobenweise auf Fieber und andere Grippesymptome kontrolliert. Zugleich kündigte das slowakische Innenministerium an, unverzüglich insgesamt 300'000 Schutzmasken in die unmittelbar an der ukrainischen Grenze gelegenen Dörfer zu liefern. Auch andere europäische Länder meldeten neue Fälle von Erkrankungen und Todesfällen. So stieg in Italien die Zahl der Toten durch die Schweinegrippe auf 18.

Höchste Alarmstufe in Korea
Südkorea rief wegen der unaufhaltsamen Ausbreitung der Schweinegrippe die höchste Grippe-Alarmstufe aus. Dies bedeutet unter anderem, dass sämtliche Behörden zum Durchsetzen von Aktionen gegen die Grippe mobilisiert werden können. Die WHO sieht die Schweinegrippe-Impfmüdigkeit in vielen Ländern mit Unbehagen. «Es bereitet schon Sorge wenn Menschen, die Zugang zu Impfstoffen haben, dies nicht nutzen», sagte WHO-Sprecher Gregory Hartl in Genf.

THE FLU CASE

Unconfirmed report that seasonal flu vaccine in Ukraine contaminated with live bird flu virus

The Flu Case, 3 November 2009, 09:11
https://web.archive.org/web/20091106021144/http://www.theflucase.com/index.php?option=com_content&view=article&id=1565:unconfirmed-reports-seasonal-flu-vaccine-in-ukraine-contaminated-with-live-bird-flu-virus&catid=41:highlighted-news&Itemid=105&lang=en

Unconfirmed reports from the Ukraine say that the seasonal flu vaccine used was contaminated by the live bird flu H5N1 virus and that the presence of the artifical virus has resulted in the unusually large numbers of deaths and cases of sick people.

The symptoms reported are consistent with people being infected with the bird flu virus, namely severe lung infections, blood and pneumonia.

The panic caused by the emergence of such a virus will help big pharma, the media and WHO/UN stampede people into taking the swine flu jab.

Other safe and effective measures that offer protection against a lethal virus, such as colloidal silver, MMS, face masks and vitamins are not being mentioned by the mainstream media.

Also, WHO has officially said that the seasonal flu jab can contain a "pandemic" virus, paving the way for big pharma to put in virulent viruses.

WHO supplied Baxter in Austria with the live bird flu virus which Baxter then used to contaminated 72 kilos of seasonal flu vaccine this February.

Because Baxter is obliged to adhere to biosafety level 3 regulations when handling the aritifical bird flu virus, developed by Jeffrey Taubenberg in a US bioweapons lab, an accidental contamination can be ruled out.

Baxter distributed the 72 kilos of contaminated vaccine material with a false label to 16 labs in four countries - Czech Republic, Slovenia, Germany and Austria -- so nearly triggering a bird flu pandemic, according to the Times of India.

A WHO affiliated scientist in France, Professor Bruno Lina, told the local media this summer he was looking for a gene to make the swine flu more virulent.

Injecting the live bird flu virus into people will increase the chances of a lethal virus mutation emerging as happened in Indonesia when a WHO mandated vaccination campaign led to an outbreak of bird flu.

Виктор Лещенко

Что под маской?
Паника проходит, аптеки пустеют, эпидемия идет на спад.
Уроки по-киевски

Беларусь Сегодня, 4 ноября 2009
https://www.sb.by/articles/chto-pod-maskoy-panika-prokhodit-apteki-pusteyut-epidemiya-idet-na-spad-uroki-po-kievski.html

Ситуация в Украине в последние дни будоражила воображение впечатлительных граждан и вызывала в памяти мрачные исторические эпохи, когда страшный мор выкашивал целые города и превращал страны в безлюдные территории. Украинская тема была одной из главных во многих СМИ с прошлого четверга, когда заговорили о жуткой “жатве” свиного гриппа, легочной чуме и неведомом вирусе-мутанте... Все это сваливалось скопом на неискушенного читателя, зрителя, слушателя. И реакция не заставила себя ждать.

Правда, теперь, похоже, информационный туман начинает рассеиваться и проступают реальные детали происходящего. А вчера Интерфакс опубликовал заметку с красноречивым названием “В Киеве стихает паника вокруг эпидемии гриппа”.

Президент и премьер-министр Украины по отдельности побывали в регионах, где была отмечена эпидемия. Они признали, что в стране свыше 200 тысяч больных, но выявлено менее двух десятков случаев заражения гриппом A/H1N1 (так называемый свиной грипп). Главный санитарный врач Александр Биловол сообщил более конкретные цифры: в результате эпидемии умер 71 человек (грипп никогда не обходится без жертв) и есть 14 лабораторно подтвержденных случаев гриппа A/H1N1. Премьер-министр Украины Юлия Тимошенко вчера заявила, что эпидемиологическая ситуация стабилизировалась.

Так чем же болеют у соседей? Как сообщил Минздрав, в Киеве, например, сезонным гриппом и ОРЗ заболели 6357 человек, 129 из них поставлен диагноз грипп, 6228 – острое респираторное заболевание. Умерших вследствие этих недугов нет.

Или другой город – Луцк. Его мэр, как сообщает газета “Корреспондент”, заверил, что в городе до сих пор не выявлены случаи заболевания A/H1N1. В то же время он признал факт эпидемии обычного гриппа и ОРЗ. “В нынешнем году вокруг этой проблемы создан чрезмерный ажиотаж, что стало причиной паники”, – убежден градоначальник Луцка Богдан Шиба.

А паника в Украине на самом деле была. В конце прошлой недели в Киеве люди штурмом брали аптеки. Там, где еще можно было купить какие-либо средства от простуды и гриппа, очереди выходили на улицу. В стране был приостановлен призыв в армию, отменены занятия в университетах, школах, ограничены поездки и перелеты внутри страны, отменены даже массовые политические митинги. И это в самый разгар президентской предвыборной кампании. Некоторые политики даже призывали власти ввести чрезвычайное положение, что означало бы прямой путь к отмене выборов.

В эпидемиологическую ситуацию вмешаться пришлось и спикеру Верховной рады Владимиру Литвину: “Судя по тому, что происходит, если бы не было этой беды, ее стоило бы придумать. Это надо было бы сделать с той целью, чтобы закрыть все остальные темы и списать все остальные проблемы нашей жизни. Нужно возвращаться к спокойному, взвешенному и ответственному разговору”.

Юлия Тимошенко пригрозила владельцам аптечных учреждений уголовными делами: “За двадцать дней был продан полугодовой запас на всех складах и аптеках медицинских препаратов, поэтому возник дефицит препаратов. Кроме того, началась спекуляция. Я уже обратилась к Генеральной прокуратуре провести соответствующие проверки “.

Однако самое страшное в нынешней ситуации, как полагают специалисты, это то, что люди бесконтрольно покупали и употребляли различные препараты, которые могут вызвать нарушения в работе печени и других органов. То есть после того, как эпидемия пошла на спад, медики говорят, что теперь придется лечить украинцев, но уже от других болезней. Простая истина “не употреблять лекарственные средства без назначения врача”, похоже, в последние дни в Украине была отменена “по законам пандемического времени”.

Спираль ажиотажа, паники всегда раскручивается по одним и тем же законам. Это своеобразный вирус, который в считанные дни, а то и часы может охватить даже целые города. И если не принять экстренных мер, то домыслы и слухи начинают расти, как некие фантастические существа, и уже становится практически невозможно понять, что реально происходит. И эта сюрреалистичная картина диктует свои правила поведения, которые далеки от логики и здравого смысла.

Возможно, именно этот вывод и подвиг депутатов Верховной рады на принятие вчера проекта постановления о первоочередных мерах противодействия распространению пандемического гриппа, где речь о разработке единых подходов по информированию населения, обеспечению регионов тест-системами для диагностики, медпрепаратами и контролю за ассортиментом и ценами в аптеках.

Кстати, сегодня в Киеве состоится матч “Динамо” – “Интер”. И руководитель “Динамо” Игорь Суркис на вопросы журналистов ответил лаконично, что лично он марлевую повязку надевать не будет, но всем пришедшим на стадион на входе будут бесплатно их выдавать. И добавил: “Надеюсь, игре ничто не помешает и стадион будет полным”.

The INDEPENDENT

WHO "assumes" Ukraine gripped by swine flu, reports AFP

Independent, 4 November 2009, 01:00 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/who-assumes-ukraine-gripped-by-swine-flu-1814111.html

(AFP) **Geneva** – The World Health Organisation said Tuesday that it was valid to assume that most of the cases of influenza reportedly sweeping through Ukraine were caused by the pandemic A(H1N1) virus.

Ukrainian authorities on Sunday launched an urgent appeal for help from world powers after it imposed drastic measures to tackle a sudden surge of flu-like illness in the country.

More than 250,000 cases have been reported, according to official Ukrainian figures cited by the WHO.

"Given the potential significance of this outbreak as an early warning signal, WHO commends the government of Ukraine for its transparent reporting and open sharing of samples," the UN health agency said in a statement.

"Laboratory testing in Ukraine has confirmed pandemic H1N1 influenza virus in samples taken from patients in two of the most affected regions," it added.

"As the pandemic virus has rapidly become the dominant influenza strain worldwide, it can be assumed that most cases of influenza in Ukraine are caused by the H1N1 virus."

The highest rates of "acute respiratory illness/influenza-like illness" were found in western areas, while they were also increasing rapidly around the capital Kiev, according to the WHO.

Seventy-one people have died as a result of flu and acute respiratory infections, the Ukrainian health ministry said, but the pandemic A(H1N1) virus has been confirmed in only one of the fatal cases.

The WHO said a team of specialists who arrived in the country on Monday will initially focus on the Lviv region, where reported "severe" cases of acute respiratory illness "have been especially high."

Samples from Ukraine have also been received by the WHO's influenza research laboratory in London for tests.

"Many questions remain to be answered," the WHO said.

"The outbreak in Ukraine may be indicative of how the virus can behave in the northern hemisphere during the winter season, particularly in health care settings typically found in eastern Europe," it added.

Local analysts have suggested that rival Ukrainian leaders may be trying to exploit popular fears in campaigning ahead of January 17 presidential polls, as each candidate seeks to take the initiative in fighting the outbreak.

OBOZ.UA

У Києві зафіксовано першу смерть від свиного грипу

Oglyadach, 4 листопада 2009, 13:56
https://www.obozrevatel.com/news/2009/11/4/215022.htm

Про це повідомила прем'єр-міністр України Юлія Тимошенко.

За її словами, вона щойно отримала підтвердження смерті від грипу A(H1N1) від міністра охорони здоров'я Василя Князевича.

Раніше перший заступник голови Київської міської державної адміністрації Ірена Кільчицька повідомила, що вчора померла жінка від пневмонії.

"Сьогодні є перші підтвердження підозри, що це каліфорнійський грип", - наголосила Кільчицька.

Також вона повідомила, що у Києві на грип та гострі респіраторні вірусні інфекції хворіє 26 тис. осіб, майже половина з них - діти. Епідеміологічний поріг у Києві перевищено на 14%.

Нагадаємо, сьогодні, 4 листопада, в ході селекторної наради Тимошенко повідомила, що до епідеміологічного порогу захворюваності на гострі респіраторні вірусні інфекції та грип наближаються ще 10 областей.

У свою чергу, головний державний санітарний лікар України - перший заступник міністра охорони здоров'я Олександр Біловол повідомив сьогодні в ході селекторної наради, що в Україні виявлено 14 випадків захворювань на грип A(H1N1), з них 3 людини померло.

Також стало відомо, що з підозрою на вірус A (H1N1) госпіталізовані дві людини у Київській обл. Як повідомив під час селекторної наради голова Київської ОДА Віктор Вакараш, хворі з підозрою на вірус A(H1N1) в Переяслав-Хмельницькому і Богуславі були терміново госпіталізовані, а їх аналізи відправлені в лабораторію для підтвердження діагнозу.

У зв'язку з цим прем'єр-міністр дала доручення Міністерству охорони здоров'я України і головному державному санітарному лікарю Олександру Біловолу терміново направити в Київську обл. додатково 10 тис. упаковок препарату "Таміфлю". За її словами, необхідно доправити додаткові ліки до всіх областей, які наближаються до епідеміологічного порогу, повідомляє "РБК-Україна".

Крім того, з підозрою на грип A (H1N1) також госпіталізована одна людина в Умані (Черкаська обл.). Як повідомив голова Черкаської обласної державної адміністрації Олександр Черевко, хвора людина повернулась з Києва.

Тим часом, Всесвітня організація охорони здоров'я припускає, що більшість випадків грипу в Україні викликані вірусом H1N1, оскільки пандемічний вірус швидко став домінуючим у всьому світі.

Нагадаємо, напередодні в сесійній залі Верховної Ради під час доповіді про ситуацію, яка склалася в Україні у зв'язку з поширенням епідемії грипу, Тимошенко оприлюднила дані про те, що за 9 міс. 2009 р. в Україні від грипу померли 4 тис. 720 чоловік (за 9 міс. 2007 р. - 3 тис. 822 особи).

Обращение Президента к Украинскому народу в связи с чрезвычайной эпидемической ситуацией в Украине

Пресс-служба Президента Украины Виктора Ющенко, 4 ноября 2009, 19:00
https://web.archive.org/web/20091107100107/http://www.president.gov.ua/ru/news/15609.html

Дорогие соотечественники!

Обращаюсь к вам, выполняя свою конституционную обязанность на основании статьи 106 Основного закона государства. Причина - чрезвычайная эпидемическая ситуация в стране.

По Украине стремительно распространяются инфекции вирусного происхождения, в том числе вируса гриппа A/H1N1. Об исключительности ситуации говорит масштаб эпидемии: скорость и география ее распространения, молниеносность протекания болезни и исключительное количество смертей. Гибнут люди. Эпидемия убивает медиков. Это - вообще беспрецедентно и немыслимо в XXI веке. Всякие границы перейдены - даже те, которые по Конституции ограничивают мои действия как Президента.

Поэтому руководствуюсь самым важным: безопасностью вашей жизни и вашего здоровья.
Поэтому даю четкую и откровенную оценку ситуации. И вы должны об этом знать.
Мы имеем особые факторы риска, которые осложняют эпидемию именно в Украине.
Об этом свидетельствуют выводы Совета национальной безопасности и обороны Украины, мои многочисленные консультации с национальными и международными экспертами.

Первое.
В отличие от аналогичных эпидемий в других странах в Украине одновременно сошлись три возбудителя тяжелых вирусных инфекций: двух сезонных гриппов и «калифорнийского». По заключениям вирусологов, такое сочетание инфекций, вследствие мутации, может дать еще более агрессивный, новый вирус. Именно поэтому я обратился к Организации Объединенных Наций с просьбой провести вирусологическую экспертизу в Украине и создать соответствующую лабораторию, чтобы заблаговременно принять противоэпидемические меры.

Второе.
«Калифорнийский» вирус чрезвычайно изменчив. В Украине он появился, пройдя половину Земного шара. Это означает, что вирус приобрел особенно болезнетворную силу. Это означает, что медпомощь необходимо срочно усилить средствами экстренного, реанимационного лечения.

Третий фактор риска.
Общеизвестно, что единственным средством предупреждения любой инфекции является вакцинация. Вследствие крайне непрофессиональной и дезорганизованной кампании вакцинации против кори и краснухи, практика вакцинаций в Украине скомпрометирована в принципе. Сегодня можно сказать, по оценкам министра здравоохранения в Украине вакцинировано приблизительно 58% при эффективном уровне от 90% и выше.
Люди прекратили вакцинироваться против чрезвычайно опасных инфекций: туберкулеза, дифтерии и так далее. Это привело к высокому риску распространения инфекций во время прихода в Украину вируса «калифорнийского гриппа», что сделало невозможным профилактическую вакцинацию против двух сезонных гриппов. Все это вместе еще больше осложнило общую эпидемическую ситуацию в Украине.

Как Глава государства прошу вас, дорогие соотечественники, пересмотреть свое отношение к вакцинации и, в случае необходимости, но исключительно, подчеркиваю - исключительно после консультации с врачом, сделать ее.

В то же время, поручаю Правительству, Министерству здравоохранения немедленно развернуть профилактическую и агитационную работу в регионах, где еще нет эпидемии, заботясь прежде всего о группах особого риска.

Требую от Правительства немедленно отменить существующий порядок регистрации средств медицинского назначения, в том числе вакцин.

Изучение этого вопроса на Совете национальной безопасности и обороны выявило, что именно этот порядок дал возможность разным дельцам завозить в страну сомнительные лекарства и вакцины, которые не имеют признания в ВОЗ и других национальных учреждениях. По моему указанию сейчас этот вопрос расследует Служба безопасности.

Четвертый фактор.

А на самом деле - «четвертый реактор».

Это эпидемический, стремительный характер распространения вирусных инфекций на западе страны. Об этом было известно Правительству, руководству Верховной Рады и оппозиции еще в начале октября этого года.

Первое, наиболее эффективное средство профилактики - не допускать скопления людей.

Игнорируя этот принцип, в Киев были завезены сотни тысяч людей из разных регионов - и из эпидемического очага, и из областей, где не было признаков этой эпидемии. Это резко повысило риск распространения инфекции.

Подчеркиваю: это было известно. И это проигнорировали: и руководитель парламента, и лидер оппозиции, и прежде всего Премьер-министр. А свою должностную обязанность не выполнил Главный государственный санитарный врач и его подчиненные в областях, в том числе и в городе Киеве.

Это прямо напоминает первомайскую демонстрацию в Киеве после аварии на Чернобыле.

Это - проявление преступной безответственности политиков и полного равнодушия к людям.

Приведу один пример. 20 октября в Тернополе объявлена эпидемия гриппа, школы, садики закрыты на карантин. «21 октября в Тернополе прекращается обучение в общеобразовательных, начальных школах в связи с ростом заболеваемости гриппом и ОРВИ». Это распоряжение местной администрации.

По состоянию на 20 октября уровень заболеваемости ОРВИ в Тернополе составляет 172,9 случая на 10 тысяч населения, эпидемиологический порог для Тернополя составляет 160 больных на 10 тысяч населения. Другими словами - все службы страны, которые контролируют данный показатель, были информированы и знали об этой ситуации.

Вместе с тем ни один санитарный врач не запретил ни перемещение людей, ни их собрание - в том числе и в городе-герое Киеве, когда 24 октября собрался соответствующий майдан.

Хочу напомнить, уважаемые, к 24 октября 2009 года в самой Тернопольской области уже было зафиксировано 10 смертей, 6 смертей - во Львовской области. И после проведения майдана, через 7 дней Киев получил обстоятельства, при которых был достигнут тот уровень заболеваемости, после которого вводится объявление эпидемии гриппа. Это, казалось бы, простое поведение больших политиков. Элементарное игнорирование средствами, с которых начинается профилактика борьбы с этим заболеванием в любой стране мира, любом обществе. А нам надо шоу проводить, нам надо концерты, так как уже заплачено, 130 млн. уже потрачено.

В этом, уважаемые украинцы, я усматриваю не только моральную, но и уголовную ответственность. Я обратился к Генеральной прокуратуре Украины с требованием возбудить уголовные дела по фактам преступной халатности, которую проявили прежде всего Главный государственный санитарный врач Украины, санитарный врач города Киева, члены правительства, которые имели ежедневную информацию об эпидемической ситуации в стране, но ради политических дивидендов и амбиций не остановились ни перед чем.

Сейчас единственным принципом организации противоэпидемических мероприятий в общенациональном масштабе должен быть следующий: Лечим Запад, всеми силами защищаем Восток, Центр, Север и Юг Украины.

Сейчас я полагаюсь исключительно на профессионализм наших врачей. На сегодня они настоящие герои нашей нации.

Еще раз требую от Правительства выполнить поручение Совета национальной безопасности и обороны - решить вопрос оплаты труда наших медиков в этот сложный для страны период.

Пятый фактор.

Дорогие соотечественники, ключевая угроза, которая многократно осложняет положение, - беспорядок в системе организации здравоохранения и защиты жизни людей.

Сегодня мы должны признать, что Украина не имеет единого пространства здравоохранения. Недопущение, то есть профилактика любых инфекций, в том числе - через вакцинацию, локализация и преодоление последствий эпидемий является исключительной компетенцией Государственной санитарно-эпидемической службы Украины.

Ее возглавляет Главный государственный санитарный врач. Его назначает Премьер-министр.

Действующая Конституция после изменений 2004 года отдала реализацию государственной политики в сфере здравоохранения к исключительным полномочиям Правительства.

Практика применения этих полномочий, как свидетельствует сегодняшний день, провальная.

Исполнительной власти, которая в Украине не подчиняется Президенту, я предлагал целостный план реформы системы здравоохранения и - в течение лет - комплекс поручений и рекомендаций, которые позволяли создать оптимальную модель организации этой системы. Мои замечания подавали исключительно как безосновательное вмешательство в работу Правительства и голословную критику.

Еще в апреле 2009 года я обратился к Правительству с требованием создать специальную межведомственную комиссию против распространения вирусов гриппа, профинансировать Центр гриппа и принять все меры, чтобы защитить страну от гриппа. В том числе, чтобы иметь в наличии надлежащее количество лекарства, масок и всего необходимого.

Частичное выполнение поручений имеет свои результаты.

Проигнорировали не меня - проигнорировали народ, людей. Понятно почему. Так как в Украине до сих пор существует несправедливая система оказания медпомощи - одна для власти, другая - для народа.

Надо менять систему. Надо менять всю систему организации государственной власти в Украине. Но сейчас, в эту минуту, времени для уговоров и ожидания нет. Главным центром принятия решений должен стать Совет национальной безопасности и обороны. Невыполнение его решений будет сопровождаться немедленным представлением в правоохранительные органы.

Напоминаю это всем ответственным лицам и обращаю внимание на все мои поручения, сделанные во Львове четыре дня назад. Через три дня истекает срок выполнения этих поручений.

Своим решением ввожу должности Министра здравоохранения и Главного государственного санитарного врача Украины в состав Совета национальной безопасности и обороны.

Я осознаю свою ответственность. Выражаю глубокие соболезнования семьям и родным умерших. Выражаю глубокую благодарность медикам, которые, рискуя собой, сегодня спасают наших людей. Я поражен этим самопожертвованием. Такая преданность означает, что эпидемия будет остановлена.

Прошу всех вас, дорогие соотечественники, проявить солидарность, взаимную поддержку и строго придерживаться всех средств защиты собственного здоровья и жизни. Государство ни на миг не будет стоять в стороне.

Спасибо за внимание.

President's address to the Ukrainian people on the occasion of flu epidemic in Ukraine

Press office of President Victor Yushchenko, 4 November 2009, 19:00
https://web.archive.org/web/20091108095524/http://www.president.gov.ua/en/news/15609.html

Dear fellow citizens!

I address you in performance of my constitutional duty under the Article 106 of the Basic Law of the state.

The reason is the emergency epidemic situation in the country. Infections of viral origin, including the A/H1N1 flu, are rapidly spreading across Ukraine. The emergency is evident in the scale of the epidemic: the speed and the geography of its spreading, rapid progress of the illness and the exceptional number of deaths. People are dying. The epidemic is killing doctors. This is absolutely unprecedented and inconceivable in the XXI century. All the limits have been exceeded - even those under the Constitution that determine my actions as the President.

Therefore I am motivated by the most important: the security of your life and your health.
Therefore I give clear and frank assessment of the situation. And you should know that.
We have special risk factors that aggravate the epidemic in Ukraine.
The conclusions of the National Security and Defense Council of Ukraine, my numerous consultations with national and international experts show that.

First.
Unlike similar epidemics in other countries, three pathogens of viral infections came to Ukraine at the same time: two of them are seasonal flu and the third is the A/H1N1.
According to virologists, such a combination of infections due to mutation may produce a new, even more aggressive virus.
That's why I have addressed the United Nations with the request to conduct a virologic examination in Ukraine and to establish the appropriate laboratory in order to take timely preventive measures.

Second.
The A/H1N1 virus is easily mutating. It has travelled across half of the globe before coming to Ukraine. This means that the virus has become particularly pathogenic. This means that medical aid must be urgently reinforced by emergency, critical care treatment.

The third risk factor.
It is generally known that the only way to prevent any infection is vaccination. Due to unprofessional and highly disorganized vaccination against measles and rubella in Ukraine the practice of vaccination is compromised in essence. According to the estimates of the Minister of Health approximately 58% of citizens are vaccinated today in Ukraine with the effective level being 90% and higher.

People have stopped getting vaccinated against extremely dangerous infections: tuberculosis, diphtheria, etc. This led to high risk of A/H1N1 infection spread, when the virus came to Ukraine and made impossible preventive vaccination against both strains of seasonal flu. All this made general epidemic situation in Ukraine even more complicated.

As the President I ask you, dear fellow citizens, to reconsider your attitude to vaccination and do it if necessary, but only, I emphasize it - only after consultation with the doctor.

At the same time I instruct the Government and the Ministry of Health to immediately start preventive and promotional work in areas where there is no epidemic, targeting primarily the special risk groups.

I demand the Government to immediately cancel the existing order of registration of medical supplies, including vaccines. Studying this issue by the National Security and Defense Council shown that this procedure has allowed various dealers to bring to Ukraine dubious medicines, which are not recognized by the WHO or other national institutions.

Under my direction the Security Service is investigating the issue.

The fourth factor. In reality it is the Reactor 4.

I mean the epidemic, rapid spread of viral infections in the west of the country. The Government, the leadership of the Parliament and the opposition were all aware of that already in early October.

The first and the most effective preventive measure is avoiding large gatherings of people. Ignoring this principle, hundreds of thousands of people from different regions were brought to Kyiv; from both the areas struck by the epidemic, and those where there was no evidence of this epidemic. This greatly increased the risk of infection.

I emphasize: it was a well-known thing. And it was ignored by the Chairman of the Parliament, by the opposition leader and, first of all, by the Prime Minister. And Chief Sanitary Inspector, together with his subordinates in the regions, including those in the city of Kiev ignored their professional duty.

This directly reminds of the May Day demonstration in Kiev, held shortly after the accident at Chernobyl NPP. This is a display of criminal irresponsibility of politicians and complete indifference towards the people.

Let me cite one example. On October 20 the epidemic of flu was declared in Ternopil with schools and kindergartens closed for quarantine. "From October 21 secondary and primary schools are closed due to the growing rate of flu and ARD sickness". This was the order of local authorities.

As of October 20 the rate of ARD in Ternopil was 172.9 cases per 10 thousand people with epidemiological threshold for the city being 160 patients per 10 thousand people. In other words - all services of the country responsible for monitoring the figure were informed and knew about the situation.

However, not a single Sanitary Inspector has banned either the movement of people, nor their gathering, including those in Kiev on October 24, when people have gathered at the central square.

I would like to remind you, my dear, that on October 24, 2009 10 deaths were known to have occurred in Ternopil region itself and 6 deaths were reported in Lviv region. And in 7 days after the abovementioned gathering Kyiv turned out in the situation, when the rate of sickness demanded the announcement of flu epidemic. This is the behavior of the great politicians. The neglect of elementary means of prevention of a disease in any country in the world, by any society. Because they must conduct a show, they have concerts, because they were paid for and 130 million have already been spent.

In that, dear Ukrainians, I see not only moral but also criminal liability.

I have addressed the Prosecutor General of Ukraine with the request to institute criminal charges of negligence committed by first of all the Chief Sanitary Inspector, Kyiv City Sanitarian and the officials, who, despite having daily information on the epidemic situation in the country, neglected it in pursuit of political dividends and ambition.

Now, the only principle of organizing preventive measures at the national scale should be as follows: We treat the West and defend East, Center, North and South of Ukraine amain.

I now rely solely on the professionalism of our doctors. Today they are the true heroes of our nation.

I once again demand the Government to comply with the order the National Security and Defense Council to resolve the issue of wages for our doctors in this difficult period for the country.

The fifth factor.

Dear fellow citizens, the key threat that is aggravating the situation is chaos in the system of healthcare and protection of lives of people.

Today we must recognize that Ukraine does not have a single healthcare system. Prevention of any infection, including through vaccination, the localization and overcoming the consequences of epidemics is the responsibility of the State Sanitary-Epidemiological Service of Ukraine.

The Service is headed by the Chief Sanitary Inspector. He is appointed by the Prime Minister.

The current Constitution after alterations in 2004 makes the Government solely responsible for conducting state healthcare policy.

The practice of using the power, as evident today, is a failure.

To the executive power, which is not subordinate to the President, I have suggested the holistic healthcare reforms plan and a set of instructions and recommendations that would help create the optimal model of the system for years to come. My remarks were presented as the groundless interference in Government's work and as the unfounded criticism.

Back in April of 2009 I addressed the Government with the request to establish a special interdepartmental commission on fighting the spread of flu viruses, to finance the establishment of Flu Center and to take all measures to protect the country against flu. That included providing adequate availability of medicines, facemasks and all other necessaries.

Partial implementation of the instructions has its consequences.

They were not ignoring me – they were ignoring the people, the citizens. It is clear why. Because Ukraine still has unfair system of healthcare - one is for the power, the other is for the people.

We must change the system. We must change the entire system of government in Ukraine.

But now, in this moment there is no time for waiting or remonstrance.

National Security and Defense Council should become the center of decision-making.

Failure to comply with its orders will immediately result in application to the law enforcement authorities.

I remind all the responsible persons and draw attention to all of my orders, made in Lviv four days ago. In three days the deadline for compliance with these orders expires.

With my decree I put Minister of Health and Chief Sanitary Inspector of Ukraine into the Council for National Security and Defense.

I am conscious of my responsibility.

I express deep condolences to the families and relatives of those who have died.

I express my deep appreciation to doctors, who are saving our people risking their own lives. I am moved by this sacrifice. Such a commitment means that the epidemic will be stopped.

I appeal to all of you, dear fellow citizens, to show solidarity, mutual support, and strictly adhere to all the safety regulations regarding protection of your health and lives.

For not a single moment you will be left alone by the state.

Thank you for your attention.

THE FLU CASE

Ukraine slides into military rule under pandemic pretext

The Flu Case, 4 November 2009, 15:03
https://web.archive.org/web/20091107015145/http://www.theflucase.com/index.php?option=com_content&view=article&id=1605:ukraine-slides-into-military-rule-under-pandemic-pretext&catid=1:latest-news&Itemid=64&lang=en

The Ukrainian government is coming under increasing criticism in the German media for imposing military rule on the country in response to a pandemic.

The Ukraine yesterday said it would close all schools in the country for a week, and suspend basic rights such as the freedom of movement and assembly.

In addition, some border crossings to Slovakia have been closed.

The latest crackdown comes as the government said a planned election might not be held on schedule because of the pandemic.

The President is expected to declare a state of emergency any day heralding the beginning of rule by presidential decree.

Konstantin Bondarenko, head of an insitute in Kiev, told the Russian newspaper "Trud" that the current wave of sickness was no worse than the usual seasonal flu.

He said that there were political forces that wanted to profit from portraying themselves as saviours of the nation, according to a report in the German news magazine Der Spiegel.

Whatever is causing so much sickness in the Ukraine – whether it is a pneumonia plague bioweapon intentionally released or another virus, – it is clear that the government is using the pandemic to undermine democracy in the Ukraine, a country brought to its knees by a corrupt clique of oligarchs in government, who have enriched themselves at the expense of the people and whose grip on power has been shaken by violent protests.

Boursorama

Peste et H1N1 en Ukraine

Bourso Rama, 4 novembre 2009, 12:34
https://web.archive.org/web/20091109034058/http://www.boursorama.com/forum-soitec-silicon-peste-et-h1n1-en-ukraine-392516034-1

J'ai des infos d quelqu'un sur place.
Dans la ville d'Ivanofrankich (désolé pour l'orthographe), plusieurs 10 aines de morts en quelques heures, dont médecins de l'hôpital.
On craint combinaison H1N1 et peste.
Semaine dernière épendage de chimie sur la ville tout le monde porte des masques.

THE FLU CASE

More reports of pneumonic plague following aerial spraying in the Ukraine

The Flu Case, 6 November 2009, 17:02
https://web.archive.org/web/20091109034058/http://www.boursorama.com/forum-soitec-silicon-peste-et-h1n1-en-ukraine-392516034-1

More and more eyewitness accounts suggest that pneumonic plague has been deliberately released by airplanes spraying towns in the Ukraine, including this post in French relaying information from people on the ground in one of the affected regions:

"I have information from someone who is on the spot," writes the blogger on the town of Ivanofrankich(apologies about the spelling), there were more than 10 deaths in a few hours, including hospital doctors. There are fears of a combination of the H1N1 and the plague.

Last week a chemical discharge on the town.

Everyone is wearing masks.

My information comes from someone who is there right now, who has a member of the family working in the hospital."

THE FLU CASE

Rival: Ukrainian PM using flu scare for politics

The Flu Case, 4 November 2009, 14:54
https://web.archive.org/web/20091107021207/http://www.theflucase.com/index.php?option=com_content&view=article&id=1604:rival-ukrainian-pm-using-flu-scare-for-politics&catid=1:latest-news&Itemid=64&lang=en

Ukrainian Journal, Tuesday, 3rd of November, 2009

The government overreacted to an outbreak of the swine flu in Ukraine to give competitive advantage to Prime Minister Yulia Tymoshenko at the next presidential election, a Tymoshenko rival charged Monday.

The panic triggered by the government's decision to declare the outbreak a major threat, has served to overshadow recent scandals involving Tymoshenko loyalists, Arseniy Yatseniuk, the No. 3 most popular presidential candidate, said. "This is in fact part of the political campaign," Yatseniuk said in an interview with ICTV. "The main thing is to get the presidential office. All efforts and resources have been thrown for this."

At least 71 people, in western regions of Ukraine, were killed by the swine flu over the past three weeks, but the death toll figure has been apparently hovering around levels usually caused by seasonal flu.

Oleksandr Bilovol, a deputy healthcare minister, said Monday the outbreak has been essentially contained in 11 out of 25 Ukrainian regions, with the number of people only 15% exceeding figures reported in previous years. "Figures in other the regions are in line with 2007 and 2008," Bilovol said.

The Tymoshenko government on Friday declared the outbreak as the threat of the third level – the highest possible – to unlock spending of up to 3 billion hryvnias to combat the swine flu. Other measures included shutting down schools and public gatherings for three weeks across Ukraine, with the government also considering introducing restrictions on movement of people between the regions. The measures, some of the sternest in the world, come in sharp contrast with other Eastern European countries that face similar challenges, analysts said.

Margaret Chan, the director general of the World Health Organization, which tracks the swine flu internationally, sees the pandemic as "moderate" in severity with the overwhelming majority of patients experiencing only mild symptoms and a full recovery, often in the absence of any medical treatment.

Yatseniuk said the ban on public gatherings spreads fear and panic helping Tymoshenko to promote herself on television, while hindering other presidential candidates to campaign. Yatseniuk is Tymoshenko's biggest rival as both compete for votes in western regions of Ukraine. He is perhaps the only candidate that may challenge Tymoshenko in the first round of vote on January 17, 2010 to enter the runoff with opposition leader Viktor Yanukovych.

Yatseniuk's rating has been showing negative growth over the past several months, suggesting that Tymoshenko has been winning over voters in the western regions. "Why did the outbreak take place in four western regions? Because there are four battleground regions for the electorate," Yatseniuk said. He said the panic spread by the government helps to put aside issues that are politically damaging to Tymoshenko, including the pedophile and the murder scandals involving Tymoshenko lawmakers, and Ukraine's dismal economic performance caused by mismanagement.

"Now, look what happened," Yatseniuk said. "Does anybody talk about the pedophile scandal? No. Maybe somebody talks about Lozynskiy [a Tymoshenko lawmaker accused of shooting a person to death]? No. Maybe somebody talks about wages? No. Maybe somebody talks about four million unemployed? No. Maybe somebody talks about unpaid natural gas bills? No."

"People that are in fear, that are poor, are easier to be manipulated," Yatseniuk said. "This is what the state apparatus is aimed at – manipulating the people.

ДУРДОМ

Князевич просит уголовное дело за призывы против вакцинации

Дурдом, 4 ноября 2009, 19:34:07
https://durdom.in.ua/ru/main/news_article/news_id/12683.phtml

Министр здравоохранения Василий Князевич просит генпрокурора возбудить уголовное дело в отношении тех, кто выступал против сезонной вакцинации.

Об этом Князевич заявил на заседании, посвященном ситуации с эпидемией гриппа в Украине под руководством президента Виктора Ющенко, сообщает "Интерфакс-Украина".

"Я обратился к Медведько возбудить уголовное дело в отношении тех, кто выступал против кампании вакцинации", - сказал министр.

В свою очередь главный санврач Украины Александр Биловол считает целесообразным проводить профилактическую вакцинацию от сезонного гриппа в тех регионах, где нет пика заболеваемости.

При этом Биловол подчеркнул, что необходимо 15 млн. доз для вакцинирования и в первую очередь, вакцинироваться должны врачи, поскольку среди них заболевших 2674, и умерло 4 человека - 3 врача и 1 медработник со средним медобразованием.

Кроме того, он отметил необходимость вакцинирования беременных женщин.

Биловол уверил, что вакцина против свиного гриппа не будет использоваться, пока не будет протестирована в Украине.

По его словам, в настоящее время есть две вакцины, в том числе, одна российская, против вируса свиного гриппа.

"Пока мы не пройдем все исследования тестирования, мы ни в коем случае эту вакцинацию проводить не будем", - сказал он. При этом Биловол призвал не политизировать вопрос "этой вакцины".

Также главный санврач заявил, что Министерство здравоохранения не исключает объявления карантина еще в ряде регионов Украины.

"В случае пересечения (эпидемического) порога, карантинные мероприятия будут распространяться еще на ряд регионов", - сказал он.

Биловол добавил, что это могут быть Киевская, Полтавская, Одесская, Винницкая и Черниговская области.

Главный санврач также сообщил, что во Львовской области за пару дней несколько стабилизировалась ситуация заболеваемости гриппом.

Князевич просит генпрокурора наказать виновных в "антивакциональной кампании"

Дурдом, 5 ноября 2009, 17:27:05
https://durdom.in.ua/ru/main/news_article/news_id/12716.phtml

Министр здравоохранения Украины Василий Князевич обратился к генеральному прокурору Украины Александру Медведько с просьбой возбудить уголовное дело по фактам "заведомо ложное информирование общества о вакцинации".

Об этом сообщили в Министерстве здравоохранения Украины, Василий Князевич направил на имя генерального прокурора Александра Медведько письмо, в котором просит возбудить уголовное дело по ст. 112 КПК "по фактам заведомо ложного информирования общества о вакцинации как о действиях, которые угрожают гибелью и другими тяжелыми последствиями для людей".

Министр убежден, что действия организаторов и участников "антивакцинальной кампании" подпадают под признаки преступления, предусмотренного статьей 259 Уголовного кодекса Украины, и содержат достаточную доказательную базу в средствах массовой информации в виде выступлений и комментариев на телевидении, в газетах и журналах, в интернете на протяжении 2008-2009 лет.

Бахтеева заявила, что от гриппа и ОРВИ умерли 96 человек

Как говорится в обращении, Министерство готово максимально оказывать содействие в расследовании уголовного дела и предоставлении необходимой доказательной базы.

Напомним, в Минздраве считают нецелесообразным проводить сейчас вакцинацию населения в тех регионах, где наблюдается пик эпидемии гриппа и ОРВИ. "Но в тех регионах, где вероятность заболеваемости высокая, но эпидемии еще нет, конечно же, стоит проводить вакцинацию", - заявил заместитель министра здравоохранения Зиновий Мытник.

В то же время директор Украинского центра гриппа и острых респираторных инфекций Министерства здравоохранения Александр Гриневич сообщил, что от гриппа A/H1N1 граждан Украины начнут вакцинировать лишь через месяц-два, когда вакцины пройдут регистрацию в Украине.

Согласно последним данным Минздрава, по состоянию 5 ноября, в Украине от пневмонии умерли 95 человек. За последние сутки в Украине заболели ОРВИ и гриппом 127254 человек. Таким образом, начиная с 29 октября, в государстве болеют 632877 человек. Кроме того, 4 ноября Министерство здравоохранения заявило, что в Украине зафиксировано шесть случаев смерти от вируса гриппа A/H1N1, лабораторно подтверждены 17 случаев заболевания.

KYIV POST
UKRAINE'S GLOBAL VOICE

Yevhen Komarovsky

Flu panic stoked by political malpractice

Kyev Post, 5 November 2009
https://archive.kyivpost.com/article/opinion/op-ed/flu-panic-stoked-by-political-malpractice-52015.html

Celebrity doctor Yevhen Komarovsky talks about prevention and treatment of viral infection, and gives a thorough analysis of how political incompetence and ensuing panic harms the nation.

I recently talked to a nurse working in a regular polyclinic. She had a call from her boss, who said: "Tomorrow you have to bring three face masks to work with you." Her justified objection that they're difficult to come by was met by the boss' curt reply: "It's your problem. The night is long. There's enough time to sew them."

This information was the last drop for me, and I have decided to talk. It seems I have been talking non-stop since all of last Friday and Saturday [Oct. 30-31]. My phone book has 850 entries, and it seems that every single person in it called me. I realized that if my friends and patients (who are all well-prepared to fight a simple viral infection) are panicking, the general panic must be catastrophic.

I talked to a TV channel manager from Kharkiv on Oct. 30. It turned out it's almost impossible to address the residents of our city because the whole air time is taken up by politicians. On the same night Savik Shuster had a show about flu. This show was one of the greatest shocks of my life: I have never felt so embarrassed for my country.

What is actually happening. Most likely, Ukraine has an epidemic of a respiratory viral infection.

Dear mothers and fathers! People! Please remember that your actions should not depend on the name of the virus. Be it seasonal, swine, elephant, pandemic or no flu at all – it makes no difference. What's important is that it's a virus, and it's airborne and it affects your respiratory organs. And your actions should be based on this understanding.

Prevention

…

Treatment

…

Mistake one: Incompetence

…

Mistake two: See a doctor immediately

…

Mistake three: Unprotected doctors

…

Conclusions

If you correlate the number of those who got sick (and multiply by two because only a half of people come to the doctor), and the number of those who have died, it becomes a confirmed fact that *there is no especially heavy viral disease in Ukraine*. According to the data available by the morning of Nov. 2, officially 200, 000 people got sick, 60 died. The mortality rate is lower than from regular flu…

Yevhen Komarovsky a Kharkiv-based doctor, is the author of books on children's and parents' health. He is also owner of the private hospital Clinicom. …

Ukraine: Flu panic stoked by political malpractice
https://archive.kyivpost.com/article/opinion/op-ed/flu-panic-stoked-by-political-malpractice-52015.html

Thanks to the reader who sent the link to this op-ed item in the Kyiv Post: Flu panic stoked by political malpractice. The author, Yevhen Komarovsky, is described as a "celebrity doctor," and the item originally appeared on his blog. (at http://www.komarovskiy.net/)
It's a long piece, including a lot of common-sense medical advice, and his harshest diagnosis is of Ukrainian politicians. Excerpt:

In the first two days of panic and hysteria, the main advisers and teachers of the people were politicians, including deputies, ministers, former ministers, etc. As soon as a doctor appeared on the TV screen, it turned out that politicians are better at talking.
The apotheosis of panic was one presidential candidate's declaration that Ukrainians are dying from lung plague. I will say it again: It wasn't an old granny selling sunflower seeds who said it, but a presidential candidate!
Another presidential candidate was loudly complaining that there is no oxoline ointment [a preventative drug produced in Ukraine], that the criminal pharmaceutical companies failed to import it. Of course, none of those present could explain to the candidate that the effectiveness of this ointment is not proven, and it is imported by neither the United States, nor France, nor any other country.
There are no doctors among presidential candidates, and it must be too expensive to keep a medical adviser on staff. But there are doctors among politicians! One of them kept mixing up Teraflu, an anti-fever drug, and Tamiflu, an anti-flu drug.
When a lawmaker-doctor, who is a secretary of the health committee in the Verkhovna Rada, said that Tamiflu is a drug that only supports the immune system and that we "have decided at the National Security Council meeting that we'll buy ozeltamivir instead," I started to feel scared and embarrassed. If the country's fate is decided by people who have no idea that Tamiflu and ozeltamivir are the same thing, what can we expect?
Who else are the decision-makers going to listen to? Just like somebody else writes speeches for the president and the prime minister, someone else will now decide on the list of drugs sold in drugstores! And tons of useless "medicine" will be shipped to our country, used nowhere else in the civilized world.

Here's my advice to the decision-makers: Ask World Health Organization experts to make a list of compulsory drugs.

Komarovsky concludes by reassuring his readers that "*there is no especially heavy viral disease in Ukraine*. ... The mortality rate is lower than from regular flu."

THE FLU CASE

Ukrainian secret services arrest pandemic blogger

The Flu Case, 5 November 2009, 10:03

https://web.archive.org/web/20100102051626/http://theflucase.com/index.php?option=com_content&view=article&id=1608%3Aukrainian-secret-services-arrest-pandemic-blogger&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Ukrainian Security Service, the SBU, - the Ukrainian government's secret police - has arrested a 30-year-old man who reported on the unfolding pandemic in the country, specifically on 170 people being hospitalised, trains travelling through Tarnopol without stopping, planes carrying out disinfection missions at night time and the death of students at Tarnopol and Lviv.

The case has gone to court. If found guilty, the blogger can be sentenced to one month of forced labor, have a 20% salary deduction or be fined 15 times the minimum income.

The blogger was arrested for spreading "rumours and fearmongering" under special emergency laws the Ukrainian government is implementing under the pretext of fighting a pandemic.

According to Ukraine's presidential decree and a decision by the Ukrainian National Security and Defence Board of 30 October 2009, the Ukrainian Security Service is to "provide national security during an outbreak of a flu pandemic in Ukraine in case of urgent actions."

- **SBU (służba bezpieczeństwa)** zajęło się osobami odpowiedzialnymi za sianie niepotwierdzonych plotek i paniki. Namierzyli 30-letniego gościa odpowiedzialnego za info o: leżących 170osobach w szpitalu, o pociągach niezatrzymujących się rzekomo w Tarnopolu, nocnej dezynfekcji z samolotów, o zmarłych studentach z Tarnopola i Lwowa i…(to najlepsze) O POLAKACH STARAJĄCYCH SIĘ ZAROBIĆ NA EPIDEMII NA UKRAINIE (jak widać jednak nie była to plotka)!

Najciekawsza jest podstawa prawna na podstawie której działa SBU: Zgodnie z dekretem prezydenta Ukrainy i decyzji Bezpieczeństwa Narodowego i Rady Obrony Ukrainy z 30 października 2009 "W sprawie pilnych działań w celu zapewnienia bezpieczeństwa narodowego podczas wybuchu pandemii grypy na Ukrainie przez Służbę Bezpieczeństwa Ukrainy"

Sprawę gościa skierowano do sądu.
Kara grzywny może wynieść do 15-krotności minimalnych dochodów lub 1- miesięczne prace przymusowe z potrąceniem 20% wynagrodzenia.

- Serwis prasowy administracji Kijowa: Prezydent miasta Czernowiecki zwrócił się do premier Tymoszenko z prośbą o wprowadzenie kwarantanny w Kijowie w celu łatwiejszej lokalizacji ognisk choroby i walki z nią. Liczba chorych na grypę i niewydolność oddechową przekroczyła 26 tyś (4 listopada) a zmarła 1 osoba na H1N1.

Vaccine opponents in the Ukraine to be arrested

Interfax-Ukraina Agency, The Flu Case, 5 November 2009, 09:48
https://web.archive.org/web/20100102012358/http://theflucase.com/index.php?option=com_content&view=article&id=1607%3Avaccine-opponents-in-the-ukraine-to-be-arrested&catid=41%3Ahighlighted-news&Itemid=105&lang=en

… see above

Health Minister Wasilij Kniazevicz asks Prosecutor General to start criminal action against those who opposed seasonal vaccinations.

"I asked Medvedko to start prosecution against those who opposed the protective vaccinations campaign," he said.

Ukraine's Chief Medical Officer Aleksander Bilovol has said that implementing protective vaccinations against influenza in the regions where raise of cases occurred is appropriate. He also emphasized the need for the vaccinations of pregnant women.

The Chief Medical Officer also stated the Health Ministry does not exclude extending the quarantine area to other Ukraine regions.

"In case of epidemic, quarantine area will be enlarged onto a few more regions," he said. [*AIU*]

Minister zdrowia Wasilij Kniazevicz prosi prokuratora o wszczęcia postępowania karnego przeciwko tym, którzy sprzeciwiali się sezonowych szczepieniom.

"Poprosiłem Medvedko o wszczęcie postępowania karnego przeciwko tym, którzy sprzeciwiali się kampanii szczepień ochronnych" – powiedział.

- Główny Lekarz Sanitarny Ukrainy Aleksander Bilovol uznał za odpowiednie przeprowadzanie szczepień ochronnych przeciwko grypie w regionach, gdzie nastąpił szczyt zachorowań.

Podkreślił również potrzebę szczepień kobiet ciężarnych.

Główny Lekarz Sanitarny powiedział również, że Ministerstwo Zdrowia nie wyklucza powiększenia obszaru kwarantanny na inne regiony Ukrainy.

- W przypadku epidemii obszar kwarantanny zostanie rozszerzony na kilka regionów – powiedział.

Bilovol dodał, że może to być Kijów, Połtawa, Odessa, Winnica (rejony).

These areas could include Kijevo, Poltava, Odesa, Vinnytsia, added Bilovol.

THE FLU CASE

Martial Law in the Ukraine

President announces arrests of opponents of forced vaccination and quarantines
WHO carries out coup d' etat under pandemic emergency pretext

The Flu Case, 5 November 2009, 10:47
http://www.president.gov.ua/en/news/15609.html
https://web.archive.org/web/20100102040358/http://theflucase.com/index.php?option=com_content&view=article&id=1609%3Amartial-law-in-the-ukraine-president-announces-arrests-of-opponents-of-forced-vaccination-and-quarantines-who-carries-out-coup-d-etat-under-pandemic-emergency-pretext&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Ukrainian President Victor Yushchenko has issued a statement strongly suggesting that the government is preparing to carry out mass forced vaccinations with the untested swine flu jab.

In a statement posted on the government website, Yushchenko announced a crack down on political protests and orders for the arrest of public health officials who have opposed mass "swine flu“ vaccinations and quarantines.

"I instruct the Government and the Ministry of Health to immediately start preventive and promotional work in areas where there is no epidemic, targeting primarily the special risk groups,“ he said.

"This means that medical aid must be urgently reinforced by emergency, critical care treatment. It is generally known that the only way to prevent any infection is vaccination,“ he said.

Yushchenko said he had ordered key medical officials who allowed political protests against the government to continue in the city of Kiev to be arrested under the pretext that they were jeopardising public health.

"I have addressed the Prosecutor General of Ukraine with the request to institute criminal charges of negligence committed by first of all the Chief Sanitary Inspector, Kyiv City Sanitarian and the officials, who, despite having daily information on the epidemic situation in the country, neglected it in pursuit of political dividends and ambition,“ he said.

Furthermore, he strongly suggested that democracy in the Ukraine was about to be uprooted and replaced by military rule under a special "interdepartmental commission“ that follows orders from WHO and the UN.

"We must change the system. We must change the entire system of government in Ukraine,“ Yushchenko said.

"Back in April of 2009 I addressed the Government with the request to establish a special interdepartmental commission on fighting the spread of flu viruses, to finance the establishment of Flu Center and to take all measures to protect the country against flu. That included providing adequate availability of medicines, facemasks and all other necessaries. "

This "interdepartmental commission“ to tackle pandemic flus appears to be subordinated to WHO and the UN under provisions in the International Health Regulations 2005.

In addition, he said he had issued a ban on all medicines to treat infections and will allow the use only of toxic and untested swine flu jabs mandated by WHO: the "vaccines“ are classified as bioweapons by EU and US authorities.

"I demand the Government to immediately cancel the existing order of registration of medical supplies, including vaccines.

Studying this issue by the National Security and Defense Council shown that this procedure has allowed various dealers to bring to Ukraine dubious medicines, which are not recognized by the WHO or other national institutions," he said.

In addtion, he said that anyone who did not follow the government's orders on the pandemic would be arrested.

"Failure to comply with its orders will immediately result in application to the law enforcement authorities," he said.

Yushchenko amended the national pandemic plan on October 30th to increase the power of the secret services and police in the event of a pandemic emergency.

In his statement, Yuschenko maintains that the "swine flu" virus may have mutated into something more virulent. Indeed, a WHO affiliated scientist, Professor Bruno Lina, has been actively looking for a gene to make the H1N1 virus more lethal in a laboratory in Lyon.

The implementation of the emergency comes amid allegations that the government, WHO and the pharmaceutical company, Baxter, were involved in the deliberate release of a pneumonic plague pathogen in order to create chaos and confusion and justify a coup d'etat.

Ukraine leader attacks rivals over flu epidemic

Reuters, 5 November 2009, 5:45 AM GMT+8
https://www.reuters.com/article/americasCrisis/idUSL4279051/

KIEV, Nov 4 (Reuters) - Ukrainian leader Viktor Yushchenko on Wednesday accused opponents running against him in a January presidential election of criminal negligence in the way they have handled an outbreak of swine flu. Yushchenko said bitter rival Prime Minister Yulia Tymoshenko, ex-prime minister Viktor Yanukovich and parliamentary speaker Volodymyr Lytvyn were all aware of a flu epidemic in the week they organised mass rallies for their own campaigns.

The government announced a series of strict measures such as school closures and a ban on public events, including rallies, last week after the first confirmed swine flu death.

Yushchenko, unlikely to win re-election with support at 5 percent of the population or under, was due to hold his rally on Saturday -- after the measures were put in place.

"The first and most effective method of prevention is not to allow mass gatherings of people. But, ignoring this rule, hundreds of thousands of people were brought to Kiev for various events from different regions," Yushchenko told television stations in a broadcast to the nation.

"I want to stress that those who organised these events knew the situation and they've ignored it. The parliament speaker and the leader of the opposition and, most importantly, the prime minister, ignored the facts of the epidemics," Yushchenko said.

"This is completely similar to the May Day rallies in Kiev after the Chernobyl disaster," he said referring to the Soviet cover-up of the 1986 nuclear reactor explosion to Ukrainians who were exposed to radiation for days without knowing of it.

Ukrainian authorities have said at least three people have died of the H1N1 variety of flu. Out of some 450,000 cases of acute respiratory illness registered in the country about 20 or slightly under have been confirmed as swine flu.

More than 80 people have died since mid-October of the flu and other respiratory illnesses and the World Health Organisation has said it assumes most flu cases in Ukraine have been caused by the H1N1 virus.

Both Tymoshenko and Yushchenko have sought to take a lead in handling the flu epidemic -- while the president appealed for aid from neighbouring countries, the prime minister met the first consignment of medicines at the airport on Sunday.

"I see not only moral, but criminal responsibility here. I have asked Ukraine's General Prosecutor's office to start a criminal investigation into the cases of negligence" amongst Ukraine's top health officials and government members, Yushchenko said.

Opposition leader Yanukovich leads the opinion polls with about 28 percent and is expected to face Tymoshenko, with about 20 percent support now, in a final round of voting in February.

Kurt Nimmo

Martial Law
Forced Vaccinations May be Unfolding in Ukraine

Infowars, 5 November 2009
https://unhypnotize.com/community/threads/martial-law-forced-vaccinations-may-be-unfolding-in-ukraine.5435/
https://web.archive.org/web/20091108023256/http://www.infowars.com/martial-law-forced-vaccinations-may-be-unfolding-in-ukraine/

The darling of the globalist NGO "color revolution" in the Ukraine, Viktor Yushchenko, has issued an official statement suggesting as president he will impose martial law on the country, force citizens to take toxic vaccinations, and outlaw demonstrations by the political opposition.

"I instruct the Government and the Ministry of Health to immediately start preventive and promotional work in areas where there is no epidemic, targeting primarily the special risk groups," declared Yushchenko. "This means that medical aid must be urgently reinforced by emergency, critical care treatment. It is generally known that the only way to prevent any infection is vaccination."

In his declaration, Yushchenko made the Ukrainian National Security and Defense Council "the center of decision-making" and said that "failure to comply with its orders will immediately result in application to the law enforcement authorities."

In addition, Yushchenko said demonstrations against the government during the growing flu epidemic would be considered acts of "criminal irresponsibility," a hint that the government will crack down on opposition under the cover of protecting the public. "I have addressed the Prosecutor General of Ukraine with the request to institute criminal charges of negligence" against government officials "who, despite having daily information on the epidemic situation in the country, neglected it in pursuit of political dividends and ambition," said Yushchenko.

On November 4, Yushchenko accused rival Prime Minister Yulia Tymoshenko, ex-prime minister Viktor Yanukovich and parliamentary speaker Volodymyr Lytvyn of ignoring the growing epidemic and organizing mass rallies for their own campaigns. "The first and most effective method of prevention is not to allow mass gatherings of people. But, ignoring this rule, hundreds of thousands of people were brought to Kiev for various events from different regions," Yushchenko said in a televised speech, according to *Reuters*. https://www.reuters.com/article/americasCrisis/idUSL4279051/

In late October, the government imposed a quarantine around the country and public events were banned, including the elections. Police enforced the compulsory wearing of protective face masks and citizens caught not wearing a mask faced harsh legal penalties.

On November 3, Ukraine shut down its schools, universities and cinemas, and banned public gatherings for the foreseeable future. Prime Minister Yulia Tymoshenko said "special regimes" designed to limit the movement of Ukraine's citizens were being introduced in an attempt to prevent the spread of the mystery virus.

On November 2, Infowars Ireland reported that authorities in Kiev were spraying of "aerosolized medication" by aircraft over city. "The office of Emergency Response in the district of Desniansko, Kiev, are tonight (30th Oct.) strongly refuting reports that light aircraft were spraying a substance over the city intended to counter a 'swine flu pandemic' in Ukraine," Infowars Ireland explained. "It was reported that light aircraft were seen over the Forest market area of the city (close to the Forest metro station) and they were spraying an aerosol substance intended to 'counter swine flu,' this of course would constitute forced medication of the population."

The office of Emergency Response in the district of Desniansko strongly refuted the accusation.

After the UN's WHO sent an emergency team to Ukraine to monitor the outbreak which as so far infected 450,000 people and killed more than 80, it was determined the illness has been caused by H1N1 swine flu. British scientists are examining samples of a strain to determine whether the virus has mutated, Sky News reports.

Other health experts believe that the virus may actually be a different pathogen, not H1N1, with some observers suggesting it may be a return of the pheumonic plague, a bacterial infection that can be 100% deadly if not treated quickly.

Earlier today, an outbreak of pneumonic plague was reported in China. "Chinese authorities have put a whole town in quarantine after an outbreak of horrifying pneumonic plague," notes Health Freedom Alliance. "Two people have died from the highly contagious disease, an even more powerful brother of The Black Death – the bubonic plague believed to have wiped out a quarter of the population of Europe in the 14th Century…. Pneumonic plague is one of the most virulent and deadly diseases on earth, usually fatal within 24 hours."

In August, 2008, the Israeli microbiologist Joseph Mosse, who is allegedly connected to the Mossad, said Baxter International had manufactured a bioweapon in the Ukraine. Mosse was arrested for supposedly making threats against the White House. "Shortly after his arrest there were reports that he had called into a radio show with a warning about a biological weapon being prepared in the Ukraine by a company called Baxter International. According to these reports, Mr Mosse said that the weapon would be spread via a flu vaccine," Radio Netherlands Worldwide reported on November 3. "Credence is being given to these reports because Mr Mosse's qualifications as a microbiologist are confirmed by his research profile" on the BiomedExperts website.

Is it possible the events in Ukraine are a precursor of things to come in the rest of Europe and the United States? If the virus currently spreading in Ukraine is a new and more deadly mutation of H1N1 or pheumonic plague, we may very well see enforced quarantines and forced vaccination in the United States.

Martial Law declared in Ukraine over Mystery Epidemic

Prison Planet, 5 November 2009

https://web.archive.org/web/20091108092608/http://www.prisonplanet.com/martial-law-declared-in-ukraine-over-mystery-epidemic.html

Arrest of objectors ordered as President says "We must change the entire system of government in Ukraine".

Ukrainian President Victor Yushchenko has all but declared martial law in the country as he announced yesterday that the National Security and Defense Council will become the supreme ruling authority in the wake of a mystery epidemic sweeping the country.

Yushchenko has made high ranking health ministers members of the NSDC, a government body consisting of the president himself, the chairman of parliament, the prime minister Yulia Tymoshenko (pictured), the head of the Security Service of Ukraine and other high ranking ministers.

Yushchenko told reporters Wednesday night that "the non-fulfillment of its decisions will be prosecuted," adding "We need to change the system. We need to change the whole system of the state power organization in Ukraine. We have no time for remonstrance no time for waiting".

The President reiterated his statements in an official address to the Ukrainian people yesterday, in which he states "Failure to comply with [NSDC] orders will immediately result in application to the law enforcement authorities."

"I instruct the Government and the Ministry of Health to immediately start preventive and promotional work in areas where there is no epidemic, targeting primarily the special risk groups," the address reads.

The address also announced orders for the arrest of public health officials who have allowed public gatherings to continue and failed to ban the movement of people, calling it "a display of criminal irresponsibility".

"I have addressed the Prosecutor General of Ukraine with the request to institute criminal charges of negligence committed by first of all the Chief Sanitary Inspector, Kyiv City Sanitarian and the officials, who, despite having daily information on the epidemic situation in the country, neglected it in pursuit of political dividends and ambition," the statement reads.

A further report from Interfax Ukrainia Agency says the Ukrainian Health Minister Wasilij Kniazevicz has asked the country's top prosecutor to open criminal proceedings against those who are opposed to the implementation of the mass flu vaccination campaign.

Yushchenko's address also issued a ban on all flu medicines not recognized by the Ukrainian government or by the World Health Organization: "I demand the Government to immediately cancel the existing order of registration of medical supplies, including vaccines." the address reads.

The address also implores Ukrainian citizens who have shunned the officially approved vaccinations to reconsider: "It is generally known that the only way to prevent any infection is vaccination," the address reads, "As the President I ask you, dear fellow citizens, to reconsider your attitude to vaccination and do it if necessary, but only, I emphasize it – only after consultation with the doctor."

”People are dying. The epidemic is killing doctors. This is absolutely unprecedented and inconceivable in the XXI century.” the address continues.

“All the limits have been exceeded – even those under the Constitution that determine my actions as the President.” Yushchenko states.

Yushchenko asserts that there are three types of influenza currently spreading throughout the country, two kinds of seasonal flu and the H1N1 strain.

The President states that this “may lead to the emergence of an even more aggressive new virus”.

However, WHO has said that the H1N1 virus in Ukraine appears “no different there than anywhere else” and that any surge there may be due to a more susceptible population.

Other mainstream reports suggest that British scientists are examining samples of the H1N1 strain from Ukraine to determine whether the virus has mutated.

As we reported earlier this week, conflicting reports suggest that the epidemic in Ukraine is down to an unidentified virus, with some indicating the virus constitutes a pneumonic plague.

According to the write up at Chechen news outlet Kavkaz Center, the Ukrainian News Agency Fraza, has reported “it has been confirmed 100% Pneumonic Plague in Ukraine” and that in order to quell panic only talk of swine flu has been sanctioned by the authorities. However, Kavkaz is a questionable source on this matter, given that Ukraine is a tactical and military ally of Russia.

Other reports have suggested that the epidemic is pure hype being played out as part of a political struggle between opposition politicians in Ukraine.

Prime Minister Tymoshenko has attempted to reverse the panic by announcing that there is no swine flu pandemic in the country at all, and that it is down to “media hysteria” and “politicians’ populist statements” in the run up to January elections.

As this article in The Scotsman highlights, Tymoshenko and Yushchenko, once allies in the so called “Orange Revolution”, are now bitter rivals that are set to fight it out in next year’s elections.

“… there is growing suspicion in the country that the H1N1 virus has also succumbed to a bitter battle for political power that now poisons all aspects of political life and threatens to wreak serious damage on the former Soviet state.” Matthew Day writes.

Around 80 people have died in Ukraine from respiratory related illnesses, it has yet to be confirmed how many were as a result of H1N1 influenza.

Whatever is really going on in Ukraine, the news has sparked a flurry of reports from conspiracy based websites that are citing a warning made in August by a man called *Joseph Moshe*, who claimed to be a former Mossad microbiologist.

Moshe hit the headlines when he was arrested after a long standoff with police in LA because he had supposedly made threats against the White House.

Shortly after his arrest, hundreds of comments and reports began to circulate stating that Moshe had called into a radio show to warn people about a biological weapon that was being prepared by Baxter International’s Ukraine plant that would be spread via a flu vaccine and would cause a plague upon it’s release.

Moshe’s identity as a microbiologist does seem to be verifiable, and Baxter certainly does have a presence in the Ukraine, as this page with Baxter’s contact information for it’s Ukraine office confirms.

Whether Moshe’s claims have any basis in truth is up for debate, however, it now seems an incredible coincidence that he fingered Ukraine as the location for a specific outbreak.

THE FLU CASE

Polish Health Minister cut off after accusing WHO of spreading disinformation in Ukraine

The Flu Case, 5 November 2009

https://web.archive.org/web/20100102021401/http://theflucase.com/index.php?option=com_content&view=article&id=1613%3Apolish-health-minister-cut-off-after-accusing-who-of-spreading-disinformation-in-ukraine&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Polish Health Minister cut off after accusing WHO of spreading disinformation in Ukraine. - The Flu Case, 5 November 2009, 11:24

TV transmission of a live parliamentary debate in Poland was cut off for fifteen minutes today after the Polish Health Minister Ewa Kopacz said that WHO was spreading disinformation in the Ukraine concerning the „swine flu“ pandemic.

Kopacz has come under fierce criticism from some quarters after she said she will resist pressure to press ahead with the mass vaccination of the population with untested swine flu jabs that could cause damage and death to more people than the swine flu.

The unexpected interruption of the TV and website transmission of the debate in parliament will fuel fears that portions of the Polish media and government allied to big pharma and banks are censoring critics of WHO and of the toxic and untested swine flu jabs.

The Polish Health Minister was cut off in the middle of answering questions on the „swine flu“ jab and footage of French President Nicholas Sarkozy was shown, it is reported.

Kopacz has been celebrated as a „hero“ by the general public for her stance in putting the health of the general public before the profits of big pharma and WHO.

Death toll still rising in Ukraine's flu outbreak

M&C, 5 November 2009, 12:38 GMT
https://web.archive.org/web/20100104132539/http://www.monstersandcritics.com/news/health/news/article_1511572.php/Death-toll-still-rising-in-Ukraine-s-flu-outbreak

Kiev - The death toll in Ukraine's flu outbreak continued to rise on Thursday.

A total of 95 persons have died from flu-related symptoms since the disease struck Ukraine's western provinces late last month, said Zinovy Mytnik, vice health minister, in comments reported by the Interfax news agency.

A total of 633,877 Ukrainians nationwide have registered with health authorities as suffering from the flu, though some have recovered since the disease's late October outbreak, Mytnik said.

Ukraine's Ministry of Health on Wednesday gave a total of currently infected at some 470,000.

The particularly virulent A/H1N1 flu strain, or swine flu, was likely responsible for a significant proportion of the infections, based on laboratory testing thus far, Mytnik said, speaking at a Kiev press conference.

Since the beginning of the flu outbreak, Ukraine's Health Ministry had sent 31 samples from persons infected with flu to a British laboratory to be checked for the presence of swine flu, of which 15 tested positive.

A former Soviet republic, Ukraine lacks a modern public health infrastructure and, since the beginning of the flu outbreak in late October, has seen severe shortages of even simple medical supplies such as protective masks and flu remedies.

No Ukrainian laboratory is capable of testing for the presence of swine flu, Mytnik said.

International medical assistance continued arriving in Ukraine on Thursday, with European Union nations taking the lead. Top contributors were Slovakia, Austria, Hungary and Poland - the last being the first country to respond to a Ukrainian October 31 appeal for foreign aid, according to an Intefax report.

EU-donated medical supplies en route or already in Ukraine included protective masks, respiration equipment and surgical gloves.

Emergency shipments of the swine flu treatment Tamiflu, produced in Switzerland, first began arriving by cargo plane to Ukraine on Sunday.

Ukrainian Prime Minister Yulia Tymoshenko, on a visit to the western city of Chernovtsy, near the epicentre of the flu outbreak, said government efforts to control the flu's spread were working.

There is no need to to invoke a national emergency,' she said, according to a Korrespondent website report.

Tymoshenko's government has attempted to control the flu outbreak with the imposition of a partial quarantine of eight western provinces most badly hit by the disease, a military-style mobilization of state-owned fabric and clothes factories to mass-produce protective masks, and limits to allowable public gatherings.

In the midst of a campaign for Ukraine's presidency, Tymoshenko has, since the beginning of the flu outbreak, repeatedly attacked the private health industry, accusing drug manufacturers of inflating prices artificially and pharmacists of hoarding medical supplies.

A government consumer protection agency in Lviv, one of the worst-hit cities in the flu outbreak, on Thursday filed a class-action suit against local health officials, accusing them of conspiring with private health suppliers to price-gouge consumers of medical supplies, the Unian news service reported.

INFOWARS IRELAND

Vaccine opponents in the Ukraine to be arrested

Infowars Ireland, 6 November 2009

https://web.archive.org/web/20091109005419/http://info-wars.org/2009/11/06/vaccine-opponents-in-the-ukraine-to-be-arrested/

Critics in the Ukraine of vaccines are to be prosecuted by the government under criminal laws, according to a report from Interfax Ukrainia Agency.

The report says the Ukrainian Health Minister Wasilij Kniazevicz has asked the country's top prosecutor to open criminal proceeedings against those people who are opposed to the implementation of the mass flu vaccination campaign also with the toxic and untested swine flu jab, sparking fears that the authorities are about to carry out wave of arrests.

The government's Chief Medical Officer Aleksander Bilovol said that the government is planning to implement a mass vaccination campaign with pregnant women an especial target.

In addition, the Health Ministry is considering extending quarantine areas in the Ukraine, which could lead to the isolation of large regions and the virtual imprisonment of populations.

It has been reported that a key Ukrainian civilian public health body has been dissolved and integrated into the army, raising fears of forced mass vaccinations by the military.

Key functions in the Ukrainian government appear to have been taken over by officials from WHO and the UN under the pretext of fighting a pandemic emergency.

Many thanks to Krzysztof Tarnawski and Mareck Podlecki from Grypa666 for the translation of the report from Interfax-Ukraina Agency.

President of Russia

Dmitry Medvedev instructed the Healthcare and Social Development Ministry to help Ukraine battle the flu epidemic

Kremlin, 6 November 2009, 20:28
http://en.kremlin.ru/events/president/news/48781

The President issued this instruction at a meeting with Healthcare and Social Development Minister Tatyana Golikova. The Minister reported that a decision has already been taken to send Russian anti-flu medicines to Ukraine as humanitarian aid, and the ministry has also proposed sending specialists to Ukraine to help carry out necessary tests.

Regarding the flu situation in Russia, Ms Golikova said that the number of cases is similar to past years and that vaccinations against the new virus would begin on November 9.

Also discussed at the meeting was the production in Russia of strategically important medicines to ensure the country's independence from foreign suppliers in this area. Mr Medvedev noted that he will comment on this issue in his Annual Address to the Federal Assembly (parliament).

Responding to Ms Golikova's observation that the flu season has sparked speculative tendencies on the medicines market, the President promised to instruct the Federal Anti-Monopoly Service and the Prosecutor General's Office to monitor developments on the pharmaceuticals market and to launch criminal proceedings in cases of unjustified price hikes. The necessary legislation for such action is already in place.

Mr Medvedev issued a relevant instruction to Prosecutor General Yury Chaika immediately following the meeting.

Александр Лукашенко: "Мы перестали кукарекать, а теперь завизжали по-свинячьи"

Комсомольская Правда, 6 ноября 2009, 17:32
https://www.kp.ru/daily/24389/568366/

Батька провел научно-популярную лекцию для украинских журналистов

Президент Белоруссии, как выясняется, весьма сведущ не только в вопросах политики и экономики. Лукашенко во время визита в Киев вывел на чистую воду тех, кто разводит истерию вокруг свиного гриппа. Недуг, как известно, бушует на Украине. В основном, в западных ее областях.

- Я знаю, что происходит в этой суперкоррумпированной среде, бандитской среде торговли и производства лекарствами, - с загадочным прищуром начал издалека Батька.

- Давайте говорить откровенно - давно мы перестали кукарекать по поводу «птичьего» гриппа. Кукарекал весь мир.

Журналисты удивленно переглядывались: кто именно из присутствовавших был замечен в кукарекании.

- Наверное, все уже продали, - продолжал разоблачать Батька, имея ввиду лекарства, которые в период эпидемии расхватывают как пирожки. - Что касается птичьего гриппа, теперь завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим?

Ну, неужели вы не понимаете, что происходит? Этот грипп, пусть даже свинячий, - это не чума и холера, которые неизлечимы, он абсолютно излечим.

Лукашенко был возмущен тем, что вполне обычную болезнь он вынужден обсуждать на своем высоком президентском уровне.

- Человек серьезно заболел и начинает лечится малиной, вареньем лечится - когда уже поздно и до сорока температура, вместо того чтобы пройти в больницу, - объяснил Батька причину летальных исходов.

- Мы в состоянии сами справиться, и Украина справится. Не надо бояться, нагнетать ситуацию и обстановку, - утешил всех Лукашенко.

УКРАИНА № 192 от 06.11.2009, ПТ

Юлия Ъ-Рябчун

Украина займется самолечением
С гриппом будут бороться отечественные фармацевты

КоммерсантЪ, 6 ноября 2009
https://web.archive.org/web/20091107182442/http://www.kommersant.ua/doc.html?docId=1268514

Премьер-министр Юлия Тимошенко вчера провела совещание с украинскими производителями лекарств. Руководители фармацевтических предприятий убедили премьера в том, что способны самостоятельно производить препараты для лечения свиного гриппа. В итоге госпожа Тимошенко поручила Министерству здравоохранения в течение двух дней заключить соответствующие контракты.

Перед началом совещания его участники оживленно обменивались мнениями об эпидемии гриппа. Некоторые жаловались на то, что противовирусных лекарств и одноразовых масок нет даже в аптеке Кабмина, на что звучал ответ: "А зачем вам маски, разве вы ездите в метро? Их надо носить только в общественном транспорте". В одноразовой маске на совещании была только глава Государственного комитета по вопросам регуляторной политики и предпринимательства Александра Кужель.

Премьер-министр Юлия Тимошенко пришла без опоздания – в 11.00. По ее словам, возникшая нехватка медпрепаратов и масок обусловлена "политизированностью ситуации" и "мародерскими действиями со стороны аптечных сетей". Премьер призвала политиков не спекулировать на теме гриппа и не создавать "искусственного ажиотажа". "Сегодня у нас рассказывают, что есть эпидемия свиного гриппа, *тогда как выявлено всего 14 случаев* заражения этим вирусом. В Украине эпидемия обычного гриппа",– подчеркнула госпожа Тимошенко. После этих слов многие участники заседания начали кашлять.

Примечательно, что часом позже в Министерстве здравоохранения состоялся брифинг, посвященный эпидемии гриппа A/H1N1 в Украине. На нем первый заместитель министра здравоохранения Василий Лазоришинец заявил, что в настоящее время официально подтверждены 22 случая заболевания гриппом A/H1N1.

Премьер-министр перечислила медицинское оборудование, которое будет закуплено правительством на бюджетные средства для борьбы с эпидемией гриппа – аппараты искусственного дыхания, кардиомониторы, отсосы для легких. Кроме того, госпожа Тимошенко пригрозила собственникам аптек, в которых не будет представлен минимальный перечень лекарств против гриппа, или на них будут завышены цены, отзывом лицензий.

В подтверждение этих слов председатель Государственной налоговой администрации Сергей Буряк сообщил о результатах проверок аптечных сетей за последние два дня, уточнив, что налоговые инспекторы проверяют аптеки на предмет наличия лекарств против гриппа и объективности установления цен на них. По словам господина Буряка, было выявлено 1 тыс. 872 нарушения. "Это повлечет за собой штрафы на сумму около 6,5 млн грн",– отметил он.

Между тем угроза применения санкций за слишком высокие цены на лекарства подействовала далеко не на всех производителей. В частности, генеральный директор ОАО "Фармак" Филя Жебривская, заявила, что дорогостоящие клинические исследования, которые проводит ее компания, не позволяют снижать отпускную цену на противовирусные препараты. На вопрос Юлии Тимошенко о причинах трехкратного повышения цен на медикаменты в фирменных аптеках "Фармак", госпожа Жебривская ответила: "До тех пор, пока фармацевтическая отрасль не будет финансироваться должным образом, у нас не будет оснований для снижения цен".

Заместитель генерального директора ЗАО "Борщаговский химико-фармацевтический завод" Людмила Безпалько начала свое выступление с громкого заявления: "Мы, работники украинской фармацевтики, не даром хлеб едим!" С этими словами она достала из своей сумочки пузырек, наполненный изумрудно-зеленой жидкостью. "Это новая разработка нашей компании – гель-антисептик на спиртовой основе,– объяснила госпожа Безпалько.– Он поможет сохранить стерильность рук и до 90% снизить риск заболевания гриппом. К сожалению, названия мы еще не придумали, поэтому можем заняться этим прямо сейчас. У меня уже есть два варианта: 'Смерть гриппу' или 'Чистые руки'".

Эти слова вызвали улыбку у всех участников совещания. Тем временем Людмила Безпалько показала еще одну новинку отечественной фарминдустрии – профилактический препарат "Альтамол", который, по ее словам, способен бороться с A/H1N1 "не хуже разрекламированного Tamiflu – при этом цена его гораздо ниже". Помощь в борьбе с эпидемией предложил и генеральный директор столичного завода "Буревестник" Игорь Синицкий. Он заявил, что до конца года завод готов поставить в больницы 300 аппаратов искусственного дыхания собственного производства по минимальной цене.

Подводя итоги, Юлия Тимошенко поручила Минздраву в течение двух дней в обязательном порядке заключить контракты на закупку производящихся в Украине медикаментов.

Ситуация с заболеванием A/H1N1 в мире

Всемирная организация здравоохранения официально подтвердила, что по состоянию на 25 октября в мире зарегистрировано более 440 тыс. случаев заражения человека гриппом A/H1N1, известным также как свиной грипп. Количество летальных исходов превысило 5,7 тыс. В частности, в **Северной и Южной Америке** заболели 174,5 тыс. человек, из них умерли 4,175 тыс. (в США – 1 тыс.); в **Африке** – 13,5 тыс. человек, умерли 75; в странах **Восточного Средиземноморья** – 17,15 тыс. человек, умерли 111. В **Юго-Восточной Азии** количество заразившихся свиным гриппом составило 42,901 тыс. человек, из них скончались 605. В странах **Западного Тихоокеанского региона** зарегистрировано 129,509 тыс. заболевших вирусом A/H1N1, из них 465 умерли.

В **Европе** заболели 64 тыс. человек, скончался 281. За последнюю неделю впервые были зарегистрированы факты смерти больных гриппом A/H1N1 в странах, граничащих с Украиной – Российской Федерации и Молдавии. В **России** общее количество заболевших превысило 2 тыс. человек, зафиксировано 10 смертей. В **Молдавии** заболели 19 человек, 1 из них умер. В **Венгрии** подтверждено 283 случая заболевания гриппом A/H1N1, из которых 4 имели летальный исход. В **Румынии** зафиксировано 447 заболевших, в **Словакии** – 149, в **Польше** – 166, в **Белоруссии** – 38. Однако факты смерти от гриппа в этих странах не зарегистрированы.

ВЗГЛЯД
ДЕЛОВАЯ ГАЗЕТА

ВОЗ:
Грипп A/H1N1 чаще всего проходит без серьезных осложнений

Взгляд, 6 ноября 2009, 18:00
https://vz.ru/news/2009/11/6/346014.html

Заболевание пандемическим гриппом вируса A/H1N1 в большинстве случаев протекает без серьезных осложнений, заявил руководитель Международной миссии ВОЗ Юкка Пуккила.

«Я хочу подчеркнуть, что как и в случаях сезонного гриппа, в случаях пандемического гриппа A/H1N1, заболевания у большинства людей протекают без серьезных осложнений и даже без потребности в медикаментозном лечении», - сказал он на пресс-конференции в пятницу.

В то же время представитель ВОЗ подчеркнул, что определенная часть людей заболевает тяжелыми формами пандемического гриппа.

При этом основными симптомами является боль в грудной клетке, выкашливание крови или окрашенной мокроты, осложненное дыхание и изменения в сознании человека. «В таких случаях необходимо срочно обращаться в больницу», - сказал эксперт.

Вместе с тем он подчеркнул, что препарат «Тамифлю» не следует давать людям, которые не больны тяжелой формой пандемического гриппа, а также тем больным, у которых не выявлен этот вирус гриппа.

«Действительно, «Тамифлю» не должен даваться людям, у которых не тяжелая форма заболевания, которые не относятся к группам риска, и людям, у которых точно известно, или скорее всего, заболевание гриппом A/H1N1. Об этом есть достаточно четкая рекомендация ВОЗ», - сказал Пуккила.

Главный государственный санитарный врач Украины Александр Биловол также подчеркнул, что препарат «Тамифлю» «дает очень высокий эффект» при лечении, однако он не является профилактическим средством.

Отвечая на вопрос, для чего Украина закупает такое огромное количество препарата «Тамифю», А.Биловол сказал: «Вы видите, что в этой ситуации у нас повышен эпидпорог заболевания на ОРВИ, вы видите, что в рекомендациях ВОЗ отмечено, что практически эффективность этого препарата при всех формах гриппа, в том числе и гриппа A/H1N1, который мигрирует у нас».

«Вторая особенность этого препарата - он может эффективно влиять на комплексные комбинированные инфекции, которые на сегодняшний день есть в Украине», - добавил Биловол, передает «Интерфакс».

Official: Ukrainian Election may be Postponed due to Swine Flu

Radio Free Europe, 6 November 2009
https://web.archive.org/web/20091109032309/http://www.rferl.org/content/Official_Ukrainian_Election_May_Be_Postponed_Due_To_Swine_Flu/1871510.html

Ukrainian President Viktor Yushchenko is considering postponing the country's presidential election scheduled for January due to the spread of swine flu in the country.

The deputy head of Yushchenko's secretariat, Ihor Popov, made the announcement on November 6, saying "if the government fails to control the situation" with the flu epidemic the poll could be pushed back until the end of May.

Health officials in Ukraine said that 109 people have died from the flu epidemic, though only 14 of those were confirmed to have contacted swine flu.

Nationwide, some 763,000 people are reported ill with flu and respiratory infections.

Ukraine erwägt offenbar Verschiebung der Wahl wegen Schweinegrippe

Merku, 6 November 2009, 21:53 Uhr
https://www.merkur.de/politik/ukraine-verschiebung-wahl-wegen-schweinegrippe-zr-519395.html

Kiew (AP) In der Ukraine wird wegen der zunehmenden Zahl an Schweinegrippeerkrankungen offenbar eine Verschiebung der für Januar geplanten Präsidentenwahl erwogen.

Igor Popow, ein Berater von Staatspräsident Viktor Juschtschenko, sagte der Zeitung «Ukrainskaja Prawda» am Freitag, die Regierung werde möglicherweise den Notstand ausrufen und die Wahl auf den 30. Mai verschieben.

«Die Epidemie hat den Wahlkampf radikal verändert», sagte Popow. «Das Verbot öffentlicher Veranstaltungen hat die Oppositionskandidaten getroffen.»

Präsidentschaftskandidaten mit einem Regierungsjob könnten sich weiter frei bewegen und auch Regionen besuchen, in denen eine Quarantäne gelte, sagte Popow. Oppositionskandidaten könnten das nicht und fühlten sich deshalb diskriminiert. Insgesamt 16 Kandidaten treten bei der Wahl an. Die Zahl der bestätigten Grippetoten in der Ukraine stieg inzwischen auf 109.

Epidémie en Ukraine: l'ensemble des régions de l'Ukraine recensent officiellement des cas mortels. Neuf régions sont soumises à quarantaine.

La France en Ukraine, 6 November 2009

https://web.archive.org/web/20091126013341/http://www.ambafrance-ua.org/france_ukraine/spip.php?article1548

La Commission spéciale de lutte contre l'épidémie s'est réunie vendredi 20 novembre et à décidé de rouvrir les établissements d'enseignement sans que les dates de reprise aient été précisées dans le détail, les autorités locales étant également concernées. Des mesures sanitaires sont prévues avant l'accueil des élèves. L'Ecole française devrait donc rouvrir ses portes la semaine prochaine

L'Ambassade de France invite la communauté française en Ukraine à éviter les rassemblements publics et à appliquer les mesures de précaution (point 2.2 du présent message).

- 1/Situation en Ukraine au 20/11/2009
- 2/ Conseils de l'Ambassade de France
- 3/ Campagne de vaccination
- 4/ Information générale
- Médecins francophones agréés auprès de l'Ambassade de France

1/Situation en Ukraine au 20/11/2009

Une épidémie de grippe est déclarée en Ukraine. Celle-ci s'est déclenchée dans trois oblasts de l'ouest de l'Ukraine (Lviv, Ternopil, Ivano-Frankivsk). Les oblasts de Vinnytsia, Volhynie, Transcarpathie, Khmelnytskyï, Tchernivtsi, Rivne, Odessa, Donetsk, Poltava, Zaporijjia, Tchernihiv, Jytomyr, Mykolaïv, Soumy, Kiev, et la ville de Kiev (la région et la ville sont deux entités distinctes et font l'objet de compilations statistiques spécifiques) ont progressivement été touchés au cours des deux premières semaines de novembre. Aujourd'hui, les 27 entités administratives d'Ukraine sont atteintes avec l'annonce officielle, par le Ministère de la Santé d'Ukraine (MOZ) des premiers cas mortels dans les régions de Dnipropetrovsk, Kirovohrad, Louhansk et dans la ville de Sébastopol. L'épidémie concerne désormais l'ensemble du territoire ukrainien.

French embassy indicates possible pneumonic plague in Ukraine

The Flu Case, 6 November 2009 16:20

https://web.archive.org/web/20100102051552/http://theflucase.com/index.php?option=com_content&view=article&id=1664%3Afrench-embassy-indicates-possible-pneumonic-plague-in-ukraine&catid=1%3Alatest-news&Itemid=64&lang=en

A note on the website of the French embassy in the Ukraine appears to support reports from doctors in the region that people there have died from the pneumonic plague.

The confirmation that people have contracted "acute respiratory infections" will fuel fears that pneumonic plague bacteria have been released to infect people and so give the appearance of a deadly swine flu pandemic as some observers have claimed.

The deadly swine flu pandemic is then being used, in turn, to justify martial law by the Ukrainian authorities.

The French embassy website states: "According to the information available, the epidemic combines the regular flu, the virus of influenza (the virus H1/N1 having been identified) and an acute respiratory infections..... whose exact nature has not yet been established, and which would be responsible for the majority of deaths."

Flue death toll in Ukraine: 109 dead

ZiK, 6 November 2009, 21:05
https://web.archive.org/web/20091227013649/http://zik.com.ua/en/news/2009/11/06/203624

Since the start of the flue outbreak, 109 Ukrainian have died from severe cases of the cold and flue, a high-ranking ministry for emergencies official announced Nov. 6. According to the health ministry, samples from 28 cases were confirmed by a London lab and 13 Ukrainian died, the official said.

Meanwhile, the flue outbreak has spread from Ukraine's western oblasts to the east, with its proportions crossing the epidemic threshold in four more oblasts of the country, Donetsk, Chernihiv, Zhytomyr and Kyiv, Ukraine chief sanitary doctor Oleksandr Bilovol told journalists Nov. 6.

The government has declared the state of medical emergency in these oblasts and the capital Kyiv, the official confirmed.

Bilokon said the total of 33,979 sick Ukrainians had been taken to hospitals, 97 of whom had died.

The official stressed the need for vaccination as a means of flue prevention in the oblasts where there is no influenza epidemic.

Pneumonic Plague Drill Held in Illinois

https://web.archive.org/web/20100102034217/http://theflucase.com/index.php?option=com_content&view=article&id=1681%3Apneumonic-plague-drill-held-in-illinois-reports-kurt-nimmo-&catid=1%3Alatest-news&Itemid=64&lang=en

In Lake in the Hills, Illinois, police will conduct a drill to combat a fictitious pneumonic plague on Saturday. “The Lake in the Hills Police Department is carrying out the test as part of a grant from the McHenry County Department of Health for its emergency health plan. In case of a biological terrorist attack or widespread disease outbreak, the site would be able get medicine to the community, Lake in the Hills Chief of Patrol Services David Brey said,” reports the Northwest Herald. Brey said officials picked pneumonic plague for the scenario “so it would have nothing to do with the swine flu.”

In Ukraine, the pneumonic plague is not fictional, although officials in that country insist the disease is a mutated version of the H1N1 virus, not pneumonic plague. Over the period of six days, the mystery disease has afflicted more than 500,000 people. The plague or virus in the Ukraine has 10 times the mortality rate than the normal swine flu. In late October, officials in Ivano-Frankivsk, a city located in southwestern Ukraine, characterized the outbreak as pneumonic plague. Pneumonic plague is caused by bacterium and is more virulent and less common than bubonic plague.

Official Ukranian sources place the number of death at 33 (as of November 5) and the news website ZIK claims a total of 97 deaths. Deutsche Presse-Agentur put the number at 95 and reported on November 5 that 633,877 Ukrainians nationwide have registered with health authorities as suffering from the flu. Doctors in the region, however, dispute this and say thousands have died.

Residents of Kiev claim light aircraft sprayed a mysterious substance on residents of the city, according to Radio Netherlands Worldwide. The spraying was denied by the country’s Office of Emergency Response.

Reports from Ukraine on the mystery illness are contradictory and confusing. “While the mainstream media is reporting that it is a surge in H1N1 influenza, alternative media sources are reporting that it is a new unidentified virus, while other reports cite witnesses in Ukraine who say there is no evidence of a pandemic at all,” Steve Watson wrote for Infowars on November 2.

On November 5, it was reported by the alternative media that a town in China was locked down after 2 people died from an outbreak of pneumonic plague. In August, the Associated Press reported on a deadly outbreak of pneumonic plague in a remote farming town in northwestern China.

It should be emphasized that at this time there is no conclusive evidence that Ukraine is suffering from an outbreak of pneumonic plague. Experts note that if the country was indeed suffering from the illness the death rate would be much higher.

However, it is odd that a preparedness drill in the United States would use the pneumonic plague as its fictional predicate. It is not explained why officials in Lake in the Hills have chosen to avoid basing their drill on the H1N1 virus.

Lake in the Hills has ranked high in Illinois cities taking federal money for “homeland security” initiatives, according to a survey conducted by the Daily Herald.

It is not known if the Department of Homeland Security is involved in the drill to be conducted this weekend.

New strain of swine flu in Ukraine, Swine flu H1N1 might have mutated, pneumonic plague

From The Old, 6 November 2009, 13:35

https://web.archive.org/web/20091109014648/http://fto.co.za/news/new-strain-swine-flu-ukraine-swine-flu-h1n1-might-have-mutated-pneumonic-plague-2009110615731.h

The first deputy minister of Health in Ukraine said in a statement that they have a different h1n1 swine flu than the rest of the world and US. In 6 days 500 000 people have been infected, 93 confirmed deaths. Statements from a lot of departments and officials seem to disagree but the fact is that if this is the h1n1 it might of either mutated or this is another swine flu strain.

The reason for this is obviously as stated above and that the strain in the Ukraine has a much bigger rate of filling the lungs with blood. This can be blamed on lack of public health but according to sources this is not the case. The plague or virus in the Ukraine has 10 times the mortality rate than the normal swine flu.

In a paper published in microbioligy news called resurecting influenza pandemic strains. The author regonized 5 strains of weaponized flu.

Confirmation that this is a mutated version: (or not a mutation of h1n1 but a viral pneumonia which is something different)

1. 250 000 to 500 000 infected in one day, way faster than any other country the h1n1 has been
2. Many cases of viral pneomonia where the lungs fill with blood, a much higher viral pneomonia rate than any other country
3. Ukraine Health minister said himself that "swine flu has mutated"
4. Much bigger death rate than normal

The most cases are in the rural north west area of the Ukraine. That statistics are not unusual for a few months but this is for a few days.

On the ground though, unconfirmed reports say that people are going on as normal, they also say that this is fear mongering. (speaking to locals)

WHO needs to confirm that the genes have are different, if they are not that means the swine flu has not mutated.

Everyone is waiting for the gene sequences which will confirm whether this has been hyped up, a real mutated h1n1 or just bad health services in the Ukraine.

Airplanes sprayed mysterious substance over Ukraine days before pneumonic plague outbreak

From The Old, 6 November 2009, 15:22

https://web.archive.org/web/20091109014651/http://fto.co.za/news/airplanes-sprayed-mysterious-substance-ukraine-days-pneumonic-plague-outbreak-2009110615732

Kiev, Ukraine - Authorities in the town of Kiev, Ukraine denied any spraying of "aerosolized medication" by aircraft over the city. This after it was reported that light aircrafts were seen flying over the forest market area that sprayed a aerosol substance to fight h1n1 or swine flu.

5 Sources confirms this and the local newspapers of Kiev also received hundreds of phone calls from residents and business owners close to the area the planes were spraying the suspicious substance. Not only that but local businesses and retailers were "advised" to stay indoors during the day by the local authorities.

As if that is not enough, the government authorities also pushed the radio stations in Kiev to deny the reports. Online on forums, websites and blogs reports came in about eye witness accounts that confirms this. There was also reports of helicopters spraying aerosols over Kiev, Lviv, Ternopil and throughout Ukraine.

30th October the Ukraine president Viktor Yushchenko ordered the army or Ministry of Defense to establish mobile hostpitals to provide “essential medications” for people infected with H1N1 (swine flu).

Then just recently the entire Ukraine was put under martial law, more shocking is the statement before the serious pneumonic plague broke out “Due to the complex epidemiological situation in the western regions of Ukraine, where tens of thousands of people have become ill, thousands are in hospital, and dozens have died.”

Клиническая картина "свиного психоза" Или почему человек существо стадное

Украинская Правда, 6 ноября 2009, 09:22
https://www.pravda.com.ua/rus/articles/2009/11/6/4512289/

В демократичних спільнотах процес, що спрямований на формування індивідуальної свідомості людини, призводить до утворення масової свідомості. Це протиріччя між метою та наслідком не є алогічним.

Адже індивідуалізоване суспільство хоч і культивує особистий розвиток кожної людини, її неповторність, унікальність, свободу вибору, проте, забуває про важливий факт, сучасна людина – істота соціальна.

Фрейд, досліджуючи психологію людини в одній зі своїх праць, стверджує: "В психологічному житті людини завжди присутній "інший". Він, як правило, є взірцем, об'єктом, помічником чи супротивником, саме тому психологія особистості з самого початку є одночасно також і психологією соціальною в цьому широкому, але цілком обґрунтованому значенні".

Самоствердження людини в соціумі відбувається за допомогою її соціальної включеності і залежить від того, наскільки соціальний конструкт реальності індивіда співпадає з соціальним конструктом реальності інших.

Геніальні художники, музиканти, письменники є видатними не тільки тому що володіють унікальними талантами, але й тому що їхні твори шедеврами визнали інші. Тобто, людина і соціум знаходяться в стані постійної взаємозалежності.

В сучасності найбільший вплив на форму та зміст взаємодії індивіда та соціуму має глобалізація. Такий фактор як фактично не обмежений доступ до інформаційної мережі Інтернет є наслідками глобалізаційного процесу. І саме він є однією з причин формування масової свідомості суспільства.

Така свідомість легко піддається маніпуляції, адже її критичний рівень є достатньо низьким. В ролі маніпулятора виступають суб'єкти, які мають в своєму розпорядженні певні владні ресурси.

Оскільки однією з головних цілей влади, в тому числі і політичної, завжди було задоволення владних інтересів, то відповідно маніпуляція масовою свідомістю вдало використовується як інструмент досягнення цих інтересів.

В даному випадку, необхідно згадати про мету самої влади. У рамках якого б політичного режиму не розглядалося розуміння влади, сутність її залишається незмінною. Основна ціль влади – задоволення власних інтересів.

А от зробити так, щоб владні інтереси співпадали з інтересами суспільства, чи хоча б створити ілюзію того, що вони тотожні – це основні завдання влади при будь-якому політичному режимові.

Для цього влада і використовує інструменти маніпуляції свідомістю.

"Політична маніпуляція – це система засобів ідеологічного і духовно-психологічного впливу на масову свідомість з метою нав’язати певні ідеї, цінності, вплинути на громадську думку і політичну поведінку для спрямовування її у заданому напрямі", – пише експерт Центру політичної кон’юнктури Росії Автандил Цуладзе у своїй праці "Политические манипуляции или покорение толпы".

Політичні маніпуляції свідомістю існують двох видів: міжособові та масові. Для здійснення міжособових маніпуляцій важливо знати типові риси характеру особистості, оскільки, саме з їх урахуванням чиниться вплив на людину.

Для такого виду маніпулятивного впливу необхідний фактичний зв'язок маніпулятора з об’єктом маніпуляції. Тому для маніпуляції на суспільному рівні влада часто використовує інший вид впливу – маніпуляцію масовою свідомістю.

Масова свідомість суперечить раціональній свідомості індивіда, вона має такі особливості, що дозволяють майже без перешкод управляти нею за допомогою маніпулятивних методів.

Політична свідомість мас не може формуватися за допомогою практичної діяльності людей і завжди буде існувати у вигляді колективних уявлень, в походженні яких провідну роль відіграє не особистий досвід, а зовнішній вплив.

Так, на сьогодні неконтрольований потік інформації формує свідомість людини і викликає цілком необґрунтовану паніку.

В Україні право людини на інформацію забезпечується на рівні законів. Але враховуючи існування всесвітньої мережі Інтернет, таке право обертається проти критичного мислення індивідів.

Користувач Інтернету отримує величезний потік інформації, який його свідомість не встигає раціонально обробити. Особистість найкраще сприймає ту інформацію, яка не потребує складних розумових зусиль, саме цей факт вдало використовує маніпулятор.

Головна умова успішної маніпуляції полягає саме в тому, що переважна більшість громадян не хоче витрачати ні розумових зусиль, ні часу, щоб засумніватись в отриманому повідомленні. Причина цього полягає в тому, що пасивно отримувати потік інформації легше, ніж критично переробляти кожен її сигнал.

Часто люди переживають звуження свідомості: отримавши повідомлення, вони одразу ж з абсолютною впевненістю приймають одне-єдине його пояснення. В маніпуляції ефективно використовуються природні почуття людини. Їх можна викликати в підсвідомості індивіда завдяки інформації, яку він отримує.
